One encouraging reflection in the varied phases of the contest against selfishness and greed and disregard of the rights of others by individuals and classes is that the fight for game and fish protection is in line with the growing sentiment of the day. The tendency of the age is toward a recognition of the advantages of relaxation from the grind. Sport as a diversion from work is of constantly growing importance. We may not realize the advance of public sentiment and practice in this direction from day to day, but we may see it by contrasting the present conditions with those of ten or even five years ago. For the man of business to take a vacation is coming to be the rule rather than the exception; to arrange for an outing of a day or a half-day is the custom of tens of thousands. All this makes for the principle of preserving those gifts of nature which supply our enjoyment in the field and on the water. Every recruit in the army of outers means a new soldier to fight in the cause of game and fish protection. The time will come when those who are for protection will so overwhelmingly outnumber those who are inimical to it that they will hold the balance of power, and the cause for which the comparatively few are now struggling will be won.

The sensational canard sent out the other day that ex-President Cleveland had dropped dead at Middle Bass Island, in Lake Erie, where he had gone on a fishing trip, proves that we may not accept as true all the press dispatches that come over the wires; and it may be that the story of the mile of pigeon flight that darkened the sky over Reedsburg, Wis., the other day, had its rise, progress and end in the brain of an enterprising press agent. There is nothing impossible, nor inherently improbable in the tale. Wild pigeons did once pass as clouds over the land; there has never been any altogether reasonable theory to account for their annihilation. The stock was lessened, we know, by the systematic trappers, but the records of that pursuit, so far as known, would not justify the belief that it had resulted in their extermination of the species. The bird disappeared; that it was exterminated has never been shown, and is not known. As it went mysteriously, it may have returned, or may return, and as mysteriously. If the Wisconsin report is true, the flight is one of the most interesting bird incidents of the times.

We print in another column a note from Senator N. F. Reiner, of the Rhode Island Legislature, regarding his introduction of a bill to provide for a State game commission. Mr. Reiner's measure calls for five commissioners, to be appointed by the Governor for the term of three years, and to serve without pay, their duty being to cause the enforcement of the bird protective laws. This is something which is very much needed in Rhode Island, where the work of protecting game has been left for the most part to the initiative of individuals and associations of private citizens, who have made it their concern. If public spirited persons can be found in the several counties willing to assume the responsibilities of the new office, the authority given them by this statute may be of material benefit in their work. We trust that the Rhode Island Assembly may enact the bill into a law, since there is reason for confidence that Gov. Dyer would name for the places the best men available. He may be depended upon to select commissioners who will be personally interested in the work; and with a game board made up as that of Rhode Island is likely to be, we may look for a thorough reform in the administration of the laws, which under existing conditions are in many districts a farce.

That is a good suggestion made by Mr. Gard. T. Lyon that salmon fishermen passing through Quebec would do well to call upon Commissioner Parent, to express to him their appreciation of his attitude toward the netters. With a Commissioner of Lands, Forests and Fisheries so manifestly disposed to crush the salmon poaching abuses, law enforcement may be looked for with confidence.

We do not gorge gingerbread just because there happens to be a gingerbread supply to gorge. Why should we try to catch more fish than we can carry just because the fish happen to take the hook? To recognize the wisdom of moderation and to exercise moderation, this is one of the characteristics which distinguish the man from the babe. Let this thought be a comfort and a consolation when the other fellow comes in with the bigger string.

The Sportsman Tourist.

Nicaraguan Experiences.—II.

BEFORE coming here I knew enough of the general character of the country not to expect much shooting. The whole Atlantic Slope of Central America is primeval forest, so densely matted with every variety of tree, bush and vine that, although there is a great deal of game, the difficulties and discomforts of going for it are almost prohibitory, and the chances of surprising it are very near to nil. In paddling through creeks and bayous and walking a few wood paths, I have found a few doves and pigeons and two or three curassow, but the chances are too slender to cut much figure. I had heard, however, that wild ducks were abundant, so I came prepared. To make a long story short, I am almost prepared to say that there are no ducks in Nicaragua. That is, there are no ducks that any white man can go hunting for, except a few blue-wing teal in late September and early October.

There is a native wild duck, the muscovy, and it is a very large and fine one, but I have never seen one out in open water, nor have I seen any flying about anywhere, passing and repassing. I killed one while walking an old railroad embankment, which ran through a swamp of tall grass and silico palm trees and a few forest trees. It flew up and lit upon a dead tree, and let me approach within shot. The natives tell me that the only way to hunt them is to go prepared to wade these swamps neck deep, and occasionally one will scare up some of these ducks, and they will generally light upon trees and let one approach within shot. But though there are men here who occasionally bring peccary or wild hog to market, no wild duck is ever brought in.

But the strangest thing to me about wild ducks here was to find little bunches of blue-wing teal all along our beach ponds, late in September and early in October; and at the same time several snipe in adjacent marshy places, for the blue-wing teal and the snipe always appear together, and exactly at that time, on our Carolina rice fields. How do they get here, 1,500 miles further south, at the same time, and why do they wish to come so far south, anyhow? I don't think there is any special attraction in the way of food, for there seems to me very little—certainly nothing approaching our rice or the wild rice, either. And they do not come here to remain, but only rest a few days and then disappear, and the snipe go with them. On their return trip in the spring I have never seen them, and I do not think they stop at all. It would be interesting to learn the limits of their migrations. I have looked in vain for a single specimen of any duck but the blue-wing teal. Beside that and the muscovy I've seen evidence of but one other duck in this country. That was a domesticated specimen of what I take to be a native woodduck, with red bill and feet and very beautiful plumage. But I think they must be rare, as I've not met a single wild specimen, and but one tame. In answer to my inquiries I was always told that I would find great quantities of ducks on Lake Nicaragua. Recently I had an opportunity to go there, and to go along the margin of the shore for about twenty miles. Very soon after I got out on the lake I began to see flocks, apparently of a very large, black duck, flying about. I counted twenty flocks in an hour, containing from ten to two hundred. In flying they often formed lines and angles, reminding me a little of geese. At last I drew moderately near a large flock upon the water and noticed with great interest how the flock acted as blackbirds frequently do—the rear birds of the flock continually rising and flying over the others and lighting in front. In that way the flock as a whole is always traveling about as fast as a man walks. I carried my boat toward them and they were not shy, and I was soon within 40 yds of the flock. There was not a duck among them! They were all the anhinga, or snake-bird, often called in Florida the water turkey, because their flight resembles a wild turkey's. They are, I believe, the most at-home bird in the water of all the birds in the world. They swim at whatever depth they wish, and their favorite depth is to have the whole body submerged and only the long, curving neck out of the water, with its tapering head and bill, looking far snakier than snakes could look to save their lives. Some weak-minded sportsmen may think that a crippled duck is a good swimmer, or diver, or hider, but he simply is not in it at all with anhinga. When the latter is wounded and dives, he goes under to stay some days, and the hunter had as well go about his other business. They will dive from the limb of a tree 20 ft. above the water if wounded, and never reappear while any Christian can afford to wait. It was really a beautiful sight to see several hundred of these birds in the water together splashing, swimming, diving and flying. Each of these birds has the two middle feathers of its tail beautifully fluted, or crimped, and I once heard of an exquisite fan, made entirely of these black fluted feathers for one of his sisters by Gen. Hampton. There would be no trouble in making these fans about Lake Nicaragua. But as for wild ducks, I doubt if there was ever a wild duck on the lake, for I examined near twenty miles of grassy edges and went into every little creek and bayou—the places where they would be if there were any—and in January, the most likely month of the year. The muscovy may be called a woodduck, as it lights in trees, and frequents marshy forests only, and not open waters, judging from what I see and hear of it. And the only open-water ducks ever to be found here are the blue-wing teal in the fall.

I have also seen in the fall a very few shore birds, Spanish curlew and yellow legs, beside the regular game snipe which came in company with the teal, as before told.

The natives have domesticated a bird, which is very interesting, and I hope someone can identify him for me. They call it al caravan. Its body is about the size of a crow's. Its plumage is inconspicuous gray, about like a plover's, and its bill and legs are proportioned like a plover's. Its head is large and its eyes very large, and it is semi-nocturnal in its habits. It has a habit of crying or cackling, something like a marsh hen, at irregular times. The natives naturally say that it marks the exact moments of noon, midnight, sunrise, sunset, high water, low water, even hours, etc., and sometimes call it the

hour bird. They become as tame as chickens and are prized for destroying every kind of insect, beetle, scorpion or reptile, even to the snakes, about the premises. They run almost as swiftly and gracefully as a chapparral cock, and show no more disposition to fly than chickens do. They would make very interesting pets about a country place anywhere.

Of all the animals in the menagerie, the sloth is one of the least popular, for he is always asleep, and one is not permitted to poke him up, though it would not do him any harm, either. But here I have been on terms of intimacy with one, studying his personal equation for many days. For instance, I would put him on a low tree and shoot him rapidly with an air gun, to develop his best bursts of speed in climbing. But it scarcely paid. A foot in five minutes was near about his highest record. Evidently his whole interior is geared down to very low speed—about that of the minute hand of a clock, and with some sort of escapement, insensible to stimulation. But I did not thoroughly solve his whole equation for two reasons. First, he did not appreciate the interest I took in him and basely absconded to the bush one night when I had scarcely had him a week. Second, from the small insight I did get into it, is surely the strangest, most unique equation in all nature's algebra. Most animals are scarcely more than simple arithmetic. Watch the alligator alligate, or the tiger tige, for even an hour or two, and one can figure their ancestry and posterity for remote generations. But the sloth is higher mathematics. Transcendental powers are clearly implicated in his variables. He was never made from any blue print, as all other animals are. He is something changed from something else. Like the equation, perhaps, of some old man, affected by some malign influence and differentiated, instead of being allowed to die of old age. Every one knows what a queer looking thing it makes of any equation to go and differentiate it. Imagine this done to the old man's by some fantastic power, and there you are. Everything about him suggests that as the solution of his strange enigma. His ossified joints, his crooked and enormous nails, his almost toothless mouth and weak jaws, his withered hair, his querulous and feeble cry, his torpid muscles and his cradle-like swinging under the limbs of trees, all indicate second childhood incarnate. Either ancestry or posterity seem alike preposterous. And deep down in his yellow eyes, too, one sees a sub-consciousness of it all. Vague memories lurk and stir below, though hope, and even resentment, have long died out. His look expresses no animosity, only hopeless estrangement, as if it said, "You, too, are one of them."

After I began to suspect what he might be, and especially after I read that in his eyes, I stopped trying to make him climb against time. In fact, I hope he does not know, and never will know, that it was I who, with the air gun, used to assist at the races. For my position was directly behind him, and he had no habit of looking back. I bring him into this narrative for two reasons. First, I wish to point out what I believe is an error in the books; at least in the only book I have accessible, Baird's "Dictionary of Natural History." This says, and repeats again, that sloths feed upon leaves. Evidently their equation has been too deep for Baird. I doubt whether any sloth ever tasted a leaf. They live upon ants, and my friend was a sort of living ant trap. His coarse, shaggy, mildewed-looking hair seemed to be full of some sticky substance which was attractive to the ants. The natives said it was honey, and that he had regularly baited himself with it at some bee tree in the woods. At any rate, he would wrap his long arms around himself and bury his long claws in the hair, and bring them out with ants adhering to them, which he would eat. The natives say that his favorite tree is one called the trumpet tree, which is always hollow and infested with ants. There is a wood ant, too, which builds nests in trees, something like a hornets' nest in appearance, and they say that a sloth will sometimes stay by one of those nests for weeks, living on the inmates.

Second, I wish to have someone identify if possible for me a relative of the sloth, as I believe, of which I have a skin, but can only get very conflicting accounts and names from the natives. The skin is 8 in. from nose to root of tail, 3 in. wide across body, tail 8 in. long, and both body and tail clothed in a dense, fine, gray, silky wool, covering the short legs and everything, 1 in. thick over the back and half as much over the under parts. I think it must be a sloth, from the enormous development of fore claw, one great big hooked claw and one about half the size, on each front foot, and four medium-sized claws on each hind foot.

The books speak of a two-toed sloth, but Baird says it is larger than the common, or three-toed. The native who gave me this skin called the animal chameleon, and described it as hanging by its claws underneath branches and living on ants. Other natives call it miko-leon, or monkey-lion; and still other miko-la-noche, or night-monkey, and say it lives upon fruit, and claws and scratches fearfully when handled. And still another native, from my description of the fine fur, calls it perro de aqua, or water dog, and says it is aquatic. And still another, a man who can write, and who brings me nice snakes, recognizes the existence of all the other animals, but says this is none of them, but is "guatuzá," and is related to the squirrels.

Will not some kind scientific party identify some of these things for me and give me a few botanical names to retaliate upon the natives with. I don't mind encountering a single strange creature or two, but I am demoralized by stirring up a whole menagerie at a time.

One experience with my ammunition is worthy of being noted. Smokeless powder shells, even where the brass case extends over the whole powder space, are absolutely ruined in this damp climate within a year, and sometimes will not even blow the shot through the barrel. In the States I have suspected them of losing strength, but here the effect of dampness seems to soon reach an extreme. But why do not the army and navy complain of their smokeless powders deteriorating? Perhaps at some future time I will write something of some interesting snakes I have met here.

JACK HILDIGO.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Types of Sportsmen.—II.

OUTSIDE of a Middlesex county village in Massachusetts, there lives a man without an enemy—an anomalous condition perhaps when it is conceded that he is successful in all undertakings. Children run to him and birds and animals fear him not. Mentally, he has a range like a modern machine gun, and shots fly off with a like rapidity and penetration; from fish worms to book worms, from the Iliad to the almanac, from political economy to abstract poverty, from religion to science, and from gunpowder to glory, his mind runs, and when with some friend on a shooting or fishing trip an incident occurs to touch off his magazine of imagination or information, one gets an entertainment well worth the price of admission. You are dead-headed in usually, and get a ticket something like the following:

"Dear H—:

"You know that I have purchased the old homestead and that I intend to pass my remaining days in this good country, in peace and comfort, interspersed with some pleasure. Your hilarity may conflict with the former, but I think it will conduce greatly to the latter, so I wish you to come up here and pass a few autumn days with me. There are many grouse about, and I think that with the aid of my pointers, we can secure a few. Anyway, there are now some in my cellar, and you need not return empty handed. What your friends don't know about you won't hurt them. [He delights in nagging me.] You have expressed doubts as to the existence of Longfellow's 'Wayside Inn.' Well, we will drive over to Sudbury behind a mass of horse construction as you ever saw, and then you may believe that there is at least as much truth as poetry in some things. Take a trolley car from Worcester, and after an hour's ride I will meet you with open arms where the track crosses the turnpike which leads to my place. Let me hear from you, saying that you have bought a return ticket. Cordially yours, _____."

Who could withstand such persuasion? Not myself surely, and so I flew to him like a moth to a candle's flame. He was there at the crossing sure enough, and with him the largest stock of geniality that one man ever carried. He had lumps of sugar in his pocket for his horse, kind words on his tongue for his neighbors; and, as though to show appreciation, the horse carried us toward the farm at a clip that was astonishing to me, and the neighbors gave him more than half of the road. We went into the open barn door flying, and I thought a smash-up would follow. Not at all. "Whoa, Prince," and the steed stopped almost in his tracks and awaited the usual caress.

Even the unemotional cows seemed to like him, and when I spoke of their attention, he said, "Don't be afraid, they won't bite you."

Who knows of greater pleasure than that of visiting a New England barn in the autumn? There are piles of yellow corn and stacks of produce on the barn floor, apples, pumpkins and sweet cider galore. The odor of the hay blended with the exhalations of the neat cattle were a happy contrast to the smells of the city left behind a few hours before. The whole atmosphere of the place and its contents was a most agreeable change from the city zephyrs contaminated with gas houses, oil refineries, soap factories and gregarious oppidians. The hired man sang bass as he did his milking, and between the notes I heard the streams of lacteal fluid strike the bottom of the tin pail. I said to my host, "That man of yours has a deep voice." "Oh, yes," he replied, "it is way down in the barn cellar, and it makes me think of Artemus Ward's criticism of a singer's ability. He said he did not believe there was much music in it, but it sounded like the rumblings of an elephant's bowels."

We went to the house, and he showed me to the guest chamber, where I was to arrange my toilet. "Good gracious man," I said, "let me wash up at the pump down in the yard. I am like a bull in a china shop, and I'll smash some of these delicate things long before I am half presentable." "Smash away," he said, as he left me.

A high art and high posted tobacco mahogany bedstead was against one side of the room. Its spotless white counterpane and the delicate tracery of its pattern, and that of the pillow shams harmonized with the lace of the window curtains. I knew that I would sleep on feathers that night. On the dressing case were costly bits of bric-a-brac, cut glass and silver implements for the improvement of personal appearance; Persian and India rugs covered the floor; the washstand and its china were a dream in gold and white; the whole room was the pride of a good housewife, and I was glad to escape from its effulgence without injury to it or to my reputation for delicacy. I found my host playing with a host of dogs on the lawn; they were all pets and of all kinds, and all had good manners; a word or a look kept them in obedience. I was introduced to the lady of the house, and at the supper table she said that her husband spoke well of me often, and that she was glad to see his friend. I then told her the old story of husband and wife who visited Europe and its art galleries, and when Apollo was pointed out to her she gave him a critical examination and said, "Well, I have seen Apollo and I have seen Ephraim, and give me Ephraim in preference always."

In the morning we were off to historical Sudbury with two English pointers and two guns in the Concord wagon. The drive over the hills in the crisp air is most exhilarating, and as we rounded a curve in the road at a sharp trot the Wayside Inn was before us, and not a myth. Built in 1700, it has withstood nearly two centuries of storm, sunshine, wear and tear. True, it has been kept in repair, but the shape, beams, timbers and most all of the woodwork are the original. Long years ago there stood an ancient oak at the left corner, and from its gnarled trunk hung the creaking sign of the red horse. To-day and nearby there are "great oaks from little acorns grown," and one of them is hollow and within its shaggy rind ten adults can stand; towering and massive, a regiment could drill in their shade as they stand guardians over the spot made famous by New England's poetic chief. We visited the low-ceiled parlor, where gathered the Landlord, the Poet, the Musician, the Theologian, the Student and the Spanish Jew. May

be they did not gather there. Possibly the license of poetry had much to do with it. Of one thing rest assured. License or no license, poetry or ribaldry, men have gathered in the room across the hallway that are now gathered to their fathers, and possibly the call to the bar hastened the call to the higher tribunal. Yet this bar is high of itself. There men were first taught to take it straight, and the high-ball of to-day was there first handed down to politicians and posterity. All that you can procure there now is soft, and as I drank my glass of ginger pop on that day I harked back

but no, that shot ended all animation, and he is apart from his former home by leagues of snow-topped hills and frozen valleys.

Now, dear reader, we have been away from the spot on a wild goose chase; let us go back to the reality. We ate our lunch on the bank of an old cellar hole; sods nearly covered the stones from between which mortar had long since gone. My friend in answer to a question told me that tradition said that it was formerly the home of a pioneer settler; that the Indians, enraged at the encroachment and aggressiveness of the Puritans,

After a while we left the spot and crossed the meadows to the river. I asked in relation to the topography of the stream, and my friend said: "This is Sudbury River, and Longfellow might as well have applied his ode to it as to the River Charles:"

River that in silence windeth,
Through the meadows rich and free,
Till at last thy rest thou findeth,
In the bosom of the sea.

This river is a confluent of the Assabet, or the reverse is true, and together they form the Concord, which in turn empties into the Merrimac, and the united waters turn the wheels in the cotton mills of Lowell, where the shuttles fly in and fly out and the bobbins whirl in endless effort to provide covering for mortals and other things. Could we have taken a boat many years ago and rowed silently through the Concord River we might possibly have surprised Nathaniel Hawthorne and Ellery Channing at their antics on the banks; maybe Ralph Waldo Emerson and Henry Thoreau might be found with them, and that all had gathered there as a result of signals. The first and middle fingers spread apart and held vertically has been understood for years by country boys to mean, "Will you go swimming?" The forefinger alone replies in the negative. These men acquired sedateness and scholarly attainments in life, yet they must have had a boy's promptings, and very likely they could be seen plugging each other with mud sods while they ran about the meadows blacked all over with river mud, while their clothes lay in four little piles on the shore. Possibly they had inflated frogs with straws and laughed in "ghoulish glee" at the failure of the loud-voiced amphibians to get below the water surface. Then again do you not suppose that they tied mud turtles upon strips of shingles and set them afloat in an open boat to paddle their own canoe? All of those boys developed great thinking power, and in some way if any one stays in sleepy old Concord for a length of time they are apt to do much thinking.

A muskrat leaves the shore at our feet, and as he darts athwart the stream the two ripples broaden out, and together with the shore, form a right-angle triangle. Yet what does he care for geometrical terms, cube root or square root? He is only interested in the roots of the sweet flag and of the lilies, and in a desire to build his winter home.

The sun goes down among the tree tops on the western hills, and the day has gone apace.

Withal it was a day of moods and tenses,
And breeches rent by barbed-wire fences—
A day when nature was lavish in giving
Pleasures that made life worth the living.

It behooves us to return to home. We leave the Wayside Inn to the future and drive out from under the oaks, grateful for hospitality received.

Sunday was the next day, and the family carriage conveyed us to the village church, where we listened to the quiet service, and, although the voice of the aged tenor was at times too high and somewhat prolonged, we departed with a feeling of profound respect for the teaching and its teachers.

In the evening the family gathered around the organ in the music room, and their voices blended in harmony as hymn after hymn was sung, and when at midnight I

THE WAYSIDE INN.

to the times when the cattlemen, teamsters, soldiers and farmers drank their Medford and their flip, and departed feeling for a few brief moments as fine as if one thousand hens were picking oats from off them. My friend showed two marks on the uncovered and hewn beams of the dancing room, and said that the upper one was the limit of Washington's highest kick; the lower was Lafayette's. Say, was he taking advantage of my gullibility, or did the Father of his Country unbend at times (backward in this instance) and enjoy a little fun? It is easy to believe it of the Frenchman, for he was of a happy turn of mind. I think it possible, for I once played leap-frog with a minister near lacustrine shores.

This tale, although true, is for sportsmen, and we will leave the inn for the fields. As we were nearly through the orchard, one of the dogs froze with head up as though in prayer, and from the top of a scrub apple tree a partridge lit out into space. It was an easy shot, and the bird goes to my pocket. Among the barberry bushes and the saffron and ruby sumach blossoms my friend's gun belched the contents of both barrels, and he led me by one bird. Later in the day, in getting over a barbed wire fence I became tangled up; with one foot on the ground and the other held high up by the barbed wire, I struggled to break away, and the dog looked on in sympathy. The wire transmitted the tremors and a frightened partridge arose further down the line. Excuse the bobance of a gunner—I made the shot of a lifetime, considering the circumstances, and the dog retrieved the result of it. My companion answered my shout and freed me from suspense, although a portion of myself was left on the fence. He told me to let it stay, that he thought it right and legal to poison crows.

As we move further away from the Wayside Inn, the game grew scarce, and only one more bird came to bag. My friend remarked that experience had taught him to keep close to the farmhouses if large numbers were wanted, and that usually two or three satisfied him, and after securing that number he was content to see his dogs do their part alone. We followed an almost obliterated road through the woods and undergrowth for a while, and after descending the sloping and partridge-berry-carpeted side of a ridge, came to an opening of an acre or more in extent. In all my wanderings of many years in field and forest, no spot was mirrored in my memory like this one. I have dreamed of it on long winter evenings up in my den, where guns, trophies, fishing rods, books and pictures and all trappings pertaining to the pastime lie in order or disorder undisturbed. There I have thought of it with pipe alight and with half-closed eyes, while the wind moaned without and the snow patted against the window panes, and a gentle voice from an adjoining room interrogated unheeded, "Why don't you come to bed?" There in my fancy was the spreading savin bush, green, low and symmetrical; there were the twisted and gnarled apple trees, bearing few remaining frost-bitten fruits for the birds to feed upon; there the clusters of the pepperidge berry were within my reach, and the bright red blossoms of the sumach swayed on their stiffening stalks in the west wind; on the stone fence the gray and red squirrels sported, in the pines beyond the crows cawed angrily at our intrusion, and awaited our departure to feed upon the crumbs of our simple lunch; the dead grass stands up against the assaults of scurrying autumn leaves; the sun shines warm upon me, and the cranberries pop under my feet as I go to the spring at the meadow's edge; I think I hear the report of my gun, and see how it disturbed the living things thereabouts, and the stuffed form of the gray squirrel climbing the tree limb before me on the wall of my room seems imbued with life, and I imagine that his sides pulsate in breathing;

had slain the whole family and burned the house. The subject put my friend in a retrospective mood, and he talked as follows: "Our forefathers came here to escape religious persecution, and sought a place where they could worship God in freedom, and then denied to others the same privilege. When they first landed they fell upon their knees and then fell upon the aborigines. As English and Protestants, they fought the French and Catholicism, from Acadia to the Alleghanies and north-west to the Great Lakes. They fought the Indians to the extermination of the latter, and they burned at the stake their own kindred as witches, and, as Tom Moore said of the Irish people, 'They hated each other for the love of God.' Traces of their bigotry and intolerance are not now wholly extinct. But 'the world do move,' and men's minds are broadening out, and fighting and wars grow

THE INN AND ITS GUARDIAN OAKS.

less frequent with each century. Preachers and others begin to realize the absurdity of praying for victory and for the slaughter of their opponents. Men of science and scholarship advocate the plain teaching of the Golden Rule, and the benefits of man's humanity to man. The day is coming when all creeds, isms and dogmas will go to the wall; when people will be bound together in plain worship of the Creator of these Elysian fields, and then joining hands 'with malice toward none, charity for all,' sing with Longfellow:

"There is no death! What seems so is transition;
This life of mortal breath
Is but a suburb of the life Elysian,
Whose portal we call Death."

was driven in the moonlight to the railroad station to take my train for home, and after retiring to my berth and when almost asleep and in my sleep the notes of the grandest of all hymns rang in my ears: "God, be with you till we meet again." W. W. HASTINGS.

A Word in Appreciation.

MAY 12.—*Editor Forest and Stream:* It is with a feeling of timidity that I write; but it is all on account of not having the gift of literary accomplishments. I cannot read FOREST AND STREAM through and then keep my tongue silent. In last week's issue Mr. W. W. Hastings wrote something that touched me personally; and it

worked on my mind to such an extent that I did not know but it was for my special benefit. But I found out differently, for I showed the article to a friend; and then the friend was not satisfied; he came around in the afternoon and said, "Say, just let me take your *FOREST AND STREAM* to-night, and after supper I will go and sit down all by myself, fill my old pipe and read it once more. Natural, isn't it—that barnyard fence, and"—I could see the dew was gathering in his eyes as he walked away; and I voluntarily went to the window and looked at the Atlantic Ocean. The article referred to is "Types of Sportsmen—I." After a New England boy has been away from home for a quarter of a century and then reads an article like that he cannot help but think of those old places, the orchard, the pine trees beyond and the little hand we used to clasp as we walked to and from the old school house, long since folded in the last sleep.

Pine Tree, too, must be in the same mental condition that I am, or he would not bring up memories of old days when two boys stood on the Hatfield meadows. But there were other boys that stood there. I have been there, and also have crawled all over the Northampton meadows after black duck with my old musket, that was used in the war of 1812. And if nothing happens in about ten days I shall be fishing, not on Hatfield meadows, but on a brook called Running Gutter that used to run the old saw mill at Hatfield, Mass. I expect to get that large trout that I did not get two years ago. He lives in a sharp bend of the brook under an old log. An old chestnut stump hangs over and gives shade on sunny days. I can see the place now, but not the trout; but if I find him at home about the 23d of this month I shall be satisfied. *

Bear Hunting with the Seminoles.

HUNTING the black bear in Florida is a sport to which few are introduced. This bear is not fierce nor dangerous, still he is "big game," and a bear hunt is always full of incident and excitement. About ten miles from Kissimmee, is a cypress swamp—it is an aquatic jungle full of fallen trees, brush, vines and tangled undergrowth, all darkened by the dense shadows of the tall cypress trees, and full of mosses and alligators. Running through the swamp is a chain of islands. Here is a field for sportsmen, and here live unmolested a whole colony of the bruin family. Hunters hear their growls and numerous fresh tracks show where the night marauders have entered the hammock, where they feast on wild honey, huckleberries, the cabbage of the palmetto and the wild orange. They seldom come out to expose themselves during the day, hence they are rarely captured, and in consequence are on the increase. Settlers frequently report depredations on their hogs, and with a spirit of vengeance organize for bear hunts; but bruin is safe in his swamp home, for without dogs trained to hunting bear, even if he were surprised, he would quickly make his escape into the jungle.

Of all game of the forest bear meat is the favorite dish of the Florida Indians—squaws, piccaninnies and dogs revel in it. With this knowledge, it was an easy matter to secure a party of Seminole chiefs and their trained dogs for a bear hunt. The auspicious day arrived. This picturesque hunting party came striding into Kissimmee as unconscious and statuesque as bronze figures of Mercury. The party was led by Chief Tom Tiger, following after in Indian file was old Chief Tallahassee, Doctor Tommy and Little Tiger, while trailing along by their sides were the formidable looking dogs. Dressed in their holiday attire, with new leggings and moccasins, bright calico shirts, a half dozen red handkerchiefs around their necks, crowned with the immense red turban, the emblem of their race, with knives and cartridges in their belts and Winchester at their sides, the Indians attracted as much attention as a Presidential party.

If ever men deserved the name of Nimrods, it is these sons of the Everglades. Even Little Tiger, a boy of twelve, with his fine rifle, could put to shame many a skilled marksman. But on to the chase. The souls of the red men seemed to leap within them at the thought of the sport after bear, while the hounds barked gleefully, so with hasty preparations our hunting party started for the Reedy Creek jungle. At this point we will turn the story over to the "tenderfoot," that the reader may better follow the chase.

"As we reached the hammock, which has been for years a veritable elysium for the bears, the dogs seemed to become possessed of a very spirit of unrest; soon they struck a trail. 'To-co-see ojus' (bear plenty), exclaimed Capt. Tom Tiger, as he observed the numerous cabbage palms with their buds freshly torn out, as well as the conduct of his dogs, and with a word of command to the hounds, he started. The rest of us followed, till we struck a marsh heavily timbered with cypress, which grew so close that the sun's rays could not reach the earth. It made a dark, damp and dangerous ground to enter. The dogs were now running with broad scent, heads well up and throats wide open. If ever there was a sound sweet to hunter's ears, it was the baying of five hounds close on bruin's trail. With nerves on a tension we rushed along, with gun carried at ready. On swept the riot. The Indians yelled as only Indians can, and the tenderfoot brought up the rear. A hunt in a Florida jungle, pulling through soft mud, climbing over logs, pushing through vines, sprawling on hands and knees through the tangled, matted undergrowth, expecting or fearing each step we would strike a moccasin, are the penalties paid for the romantic, adventurous hunt with a Seminole Indian. At last the supreme moment arrived: the leading dog had reached the bear, and soon the five dogs and the bear were having a vigorous rough and tumble fight. We were in good hearing distance, but traveling was very difficult, and our progress was slow. The Indians' cry, 'Yo hoo hee! yo hoo hee!' to the hounds made them fight furiously, so much so that bruin broke from cover and started on the chase just before we reached shooting distance. Further into the woods the chase led. Soon the sound of the pursuing dogs ceased, much to our surprise. We appealed to the nearest Indian for an explanation. 'Lo-co-see (bear) climb tree,' was the brief reply, and later, when we reached the dogs, they were running wildly around on the bank of a dark creek. We were again at a loss to comprehend

the situation, until we were shown by the Indians a leaning tree, the top of which reached to the further side of the creek, over which bruin had safely passed. 'Lo-co-see hiepus' (bear gone).

"Three hours' tramping through the swamp and hot sun had taken all of the enthusiasm out of us, and we were ready to play quits, but the stalwart red men had defiance in their faces as they said, 'Big lo-co-see; fight heap; Indian kill lo-co-see to-day.' Away to the left the brown legs of Little Tiger could be seen twinkling through the foliage; he had found some fresh tracks of a cub, and in his eagerness to capture a baby bear he proved a similar nature to his little pale-faced brother. But the stern hunters had no time for a cub, and soon started for old bruin, who by this time had crossed the marsh and gotten into a tree on the opposite bank, and by this trickery put the creek behind him. This did not daunt a Seminole Indian. Wading the shallow part of the creek, with water to the armpits, again cooled our ardor, but safety depended on not losing sight of the Indians, as we were miles in the swamp, and with no hope of finding our way out without the guidance of our red pilots. At last the bear was driven to a small island and surrounded, the island covered with tall grass and weeds hiding both dogs and bear. The dogs grew furious, and several times forced the bear to stand and fight, and such a battle as it was; the dogs didn't hesitate to take hold of old bruin, and as a result were badly lacerated from the blows of her powerful paw. We closed in and our game was in a trap. The Indians were in their future heaven; but the tenderfoot was getting very sly of being hugged. Bruin, now finding herself cornered, made a break for the open, and as she emerged from the tall grass, with the dogs at her heels, she met the stalwart figure of Tom Tiger. Rising on her hind legs, with open arms, she made one dash for him, when stepping back, in a cool and deliberate manner, he pulled the trigger of his 'scatter' gun and emptied both barrels into the bear's side. This ended the chase, and a happier set of Indians the world never saw. Immediately they drew their knives and commenced skinning the bear. As the skin adheres very tenaciously it should be taken off at once, as it comes off much easier; besides, it is difficult to scrape away all the fatty tissue after it cools, and wherever any remains it rots the pelt.

"The Indians' method of educating their dogs for hunting bear is well worth knowing. They take the gall of the bear and thoroughly saturate the nostrils of the young dog. This is excruciating pain to the dogs, and they howl and whine for hours; but it makes 'bear dogs' out of them, perfect on a trail, and this is the point with the Indian.

"The huge carcass of bruin was divided and each Indian carried a load to camp. A fire was soon built and a huge chunk of bear meat was thrown on the coals. All night long they cooked and ate, the tenderfoot getting into his hammock beneath the boughs of the oaks. We rested and dreamed—the flicker from the camp-fire, the Indians moving to and fro, the silence occasionally broken by their low soft voices, and ever and anon in this wakeful slumber came the half dreaming thought, 'Betty and me killed the bear!'"

MINNIE MOORE-WILSON

KISSIMMEE, FLA.

Podgers' Commentaries.

SAN FRANCISCO, May 3.—*Editor Forest and Stream:* I have just finished reading the last number of *FOREST AND STREAM*, and laid it down with a sigh of regret that there was no more of it. It is a particularly (not exceptionally) good number, and now, having recharged my pipe and settled back in my easy chair, the spirit moves me to give voice to my reflection and the memories of the past joys and sorrows of a sportsman. I might say joys of the past and sorrows of the present, which are so ably voiced in your editorial, "Work and Play."

You say truly that the most enthusiastic sportsman is too frequently one whose opportunities for the enjoyment of outings are few, and he looks forward to his day or two when the shackles are discarded, with quite as much enthusiastic anticipation as that with which the boys were wont to count the days to ensue before the arrival of the circus. I am not sure that scoffers are not so far out of the way in the designation of the *FOREST AND STREAM* as the "journal of the workers," or they might more properly say, the "consolation of the workers," those whose only satisfaction and compensation it is for being "chained to business" and prominent members of the Can't-get-away Club. As they peruse its columns and read of sylvan camps and bubbling brooks, they can smell the odor of bacon and broiling trout, and the scent of the pine cones to their nostrils as they glance at the breechloader and the split-bamboo resting on the wall of the snuggery.

It is true it stirs up a spirit of restlessness, and causes involuntary pacing to and fro like unto that of the wild animal in its cage; but the sportsman consoles himself with the reflection that his day is coming, and next week or next month he too will be sitting on a log beneath the greenwood tree.

It is said that the greatest pleasure is in anticipation rather than participation. It is often the case when the long-looked for outing of the sportsman brings bad weather, no game, and no fish; and all that precious time comes to naught. It is not as if one had the time to wait for a change of weather or a better location. No; he has just so many days and hours release from the slavery of business. Such disappointments never come to the man who neither shoots nor fishes. He can go through his confinement to business with perfect serenity. An occasional evening out with the boys suffices. The odor of a not over good cigar serves as well for him as that of the balmy pines. Just think what that man loses of the enjoyment of life! Presumably he never misses such. Think of a man who goes down to his grave with the boast that he never shot a bird nor caught a fish! Yet I have a few friends who do not shoot, do not fish, and abominate the water and yachting. I look upon them with commiserating pity, although the poor, misguided chaps seem to manage to enjoy life in their miserable way. They play cards and billiards long into the small hours, and go home with very indefinite ideas of the location of the latch

key-hole, and they think they are enjoying life. I have expended time in missionary work with one friend, and thought I had made a convert of him. He went so far as to purchase a gun. All that ever came of it was the shooting of a predatory cat on the back fence. Of such material are some of the Governors of our States, men who are indifferent to the preservation of game. They don't fish nor shoot; ergo, why bother about such trivial matters? I make it a rule never to vote for a candidate for any office who does not, and I take especial pains to ascertain his status.

In our State the supervisors of every county are empowered to regulate the periods of the open and close seasons; and seldom being sportsmen, they generally manage to make a beautiful mess of it. There seems to be universal bitterness and prejudice prevailing in the country against all clubs who hold shooting preserves by purchase or lease, and the supervisors, influenced by that class of men who scorn all restrictions and laws, make a great deal of trouble for the clubs. The only way out of it to bring about peace and harmony is that potent remedy for all differences—a good dinner, for the short cut to reason is through a man's stomach. So the clubs invite the supervisors to a good dinner, when and where the question can be discussed *con amore*. It is astonishing how much more clearly a supervisor can see his way, and how much more amenable to reason he is with his "stomach with good capon lined," properly moistened with liquid arguments. The efficacy of this system of settlement of the questions relative to the game laws of an adjoining county was illustrated recently when the stubborn supervisors were invited to dinner at a club presided over by a chef of great renown. There was a certain stiffness and frigidity at the outset, but the dinner ended in the most enthusiastic expressions of fraternal regard, terminating in the usual declaration that none of the party had any special desire to return to their domiciles until the morning sunbeams bathed nature in roseate glory—and they didn't.

I think this whole Philippine difficulty might have been settled in the same way. Instead of a diet of lead, an invitation to dinner—the novelty of a square meal—would have been more potent than bullets. How much less crime there would be in the world if every man could have enough to eat and drink. It has always struck me that things might have been arranged differently; for instance, with no necessity for eating oftener than say once a week. It would give plenty of time to rustle for the next meal. The female portion of the community, especially those slaves of the kitchen, would rejoice no doubt.

We have just opened up a new game season for a new game. The sea lions (so-called generally, but really a species of large seals) abounding on the rocks at the entrance of the harbor, and along the coast. Their breeding rookery is mostly on the Farrallones, a rocky island about fifteen miles off the coast. The reason of the edict against them is the complaint by the market-fishermen that they have an inordinate appetite for our best fish, especially salmon. Some one of those blasted chaps who are eternally figuring up the cubic feet and inches of the amount of oxygen a man consumes in a lifetime has estimated that the seals in one harbor consume 150 tons of salmon and other fish daily, and so a howl has gone up that they must be exterminated. And this is all to favor a community of fishermen, not one man of them a native, but all a foreign population—Greeks, Italians and Austrians—not speaking a word of English and hating Americans. Query: Which have the best right, the original seals or the interlopers? It is something akin to the poisoning of quail by the vineyardists because they eat a few grapes.

Just above the entrance to our harbor is a famous rookery, where the seals breed in great numbers. A few days ago preparations were made for a great slaughter of the innocents, and a party repaired to the rocks and bombarded the unsuspecting animals until the waters were red with their blood. Hundreds were shot, and I suppose the murdering work will continue as long as one can be found on the rocks; but the idea of exterminating them is ridiculous, for they swarm in countless thousands on the coast in the vicinity. The result will be that they will congregate at more inaccessible points and continue a fish diet as long as there is a salmon on the coast, and I don't know why we should dispute their right. They were here a long time before we came, and fish were created as much for them as for us.

A young seal when tamed is one of the most affectionate pets. An acquaintance who lived on the beach on the opposite side of the bay had a pair that he raised and that played with his children about the house, spending a part of their time frolicking in the water; and at the word of command would plunge in and bring him his breakfast of fish. They were household pets for years, but the war of extermination has commenced; how far it will succeed is a question. I prophesy it will be a failure. As long as the canneries continue to load ships for foreign markets as they now do there is a greater danger of depleting the supply by such consumption of salmon than by the seals. In earlier days salmon sold in the markets at 2 cents per pound (before the canneries got in their deadly work), and were called poor man's beef. Now the price has risen to 20 cents; but there is no scarcity as yet.

I am curious to see what will be the next subject of discussion in the *FOREST AND STREAM*. Epithets, instinct and reason, and skunks have had a substantial airing, and now I hope to see some equally interesting topics, especially the habits and characteristics of animals, a subject a lover of animals never tires of. We learn more of their habits and natures from such discussions than we could from any other source, being personal experiences, and many animals are the gainers thereby. Take the skunk, for instance, who has been greatly the gainer by the experience of contributors who have been favored by his society. His character has been greatly improved. He is an illustration of a gentleman that attends strictly to his own business, resenting any interference with it—an exemplification of the wisdom of abstaining from fooling with the buzz-saw.

We are just now having the annual exhibition of the dog show, which is well attended, especially by ladies, every one of whom will have her opinion of the judges.

that do not award the blue ribbon to her special pet. I have often wondered what the dogs themselves thought of it. Their howls are anything but a mild protest to the whole business.

PODGERS.

The Old Desk.

"Forest and Stream" Picture Books.

IN many of the letters coming to the Old Desk, and not intended for publication there are "good things" it were churlish in the Man at the Desk not to share with others. So far, that is, as he may do this without calling down upon his devoted head the criticism with which the present Robert Browning is being scored for publishing the love letters of his father, Robert Browning, and Elizabeth Barrett. Here, for instance, is a hint for FOREST AND STREAM readers, which is so pertinent and timely, that it deserves printing:

"For six years—or since the advent of my first boy—I have portfolioed FOREST AND STREAM pictures—and some others—but mainly those of animals, fish, hunting and camp scenes, etc., hoping by means of them to make up in some small way, to my little boy the lack he must realize of farm life and country experience, which lack I regard as very serious indeed, and deeply to be deplored.

"But pictures in portfolios are always tucked away out of sight, and are not available. So, while I have been gaining a little strength from my long illness, I have used it in sorting—classifying in a natural way—my accumulations and pasting them into great books of paper cambric, which the boy's mother made for me. You should see the noble and altogether surprising result and the wild delight of C— B— A—, aged six years. Really, these sumptuous folios are wonderful, and delight me and every one who has seen them as much as they do the boy.

"You have no idea what an effect can be so easily produced. I didn't know I had such riches. My Animal book, my Bird book, my Fish and Fishing book, my book of Camps and Camping, take one away to the wilderness and keep him there till he shuts them and pulls himself back to the 'settlements.'"

"C. H. A."

Camp-Fire Flickerings.

"That reminds me."

The Great Eye Theory Again.

ST. LOUIS, Mo., May 10.—*Editor Forest and Stream:* I learn through a friend that one George Kennedy, of St. Louis, has been circulating libellous stories about me, to the effect that I was treed by razor-backs in the Arkansas swamps, exterminated a mixed flock of turkeys, etc., etc.

Now, without going into details about my own lurid past, I desire to put you on your guard against this fellow Kennedy. Don't take my word for it, but just digest the following indictment and judge for yourself:

First count: Shortly after I came to St. Louis, a guileless and undiscriminating youth, I fell in with Kennedy, and he told me the following story. It was all Greek to me, as doubtless it will be to you; but with the help of certain dictionaries you may be able to struggle through it.

"We were down at White Sand Landing, the first above St. Genevieve, on the Missouri side. There were five of us: Sam Adams, Wad Smith, old Roussin, Joe the ferryman, and I. It was too hot to fish, and the woods were full of jiggers. So we went out on the back porch and sat down to a little game.

"It was 10 cent limit, and two calls five. We used grains of corn for chips; white grain one cent, yellow grain 5. We played all forenoon, and had a good pile of cobs under the table when the dinner-bell rang. The biggest pot of the day was on the table, and no openers on the third round. But Madame Roussin was very strict about meals, and after the thing had run around a couple of more times without openers, she declared that if we all didn't quit that sinful game she'd clear the table. So we went into dinner; but the meal wasn't what you would call sociable. Every fellow was thinking about that fine pot on the back porch. It didn't take long to eat all we wanted, and then there was a stampede.

"Well, sir, I'm a jug-fishing white trash with one gal-lows and a dugout, if the chickens hadn't hopped up on the card table and eaten up all our chips!"

Second count: Kennedy once went back to Pennsylvania to visit his folks. Of course he had to go fishing as soon as he'd said "Howdy." The only stream in the county was three miles away, and it ran past an insane asylum. Kennedy got in position right near the institution and fished. He is a patient man, Kennedy, but finally he had to give it up. As he passed under the asylum wall on his way home, a red-headed lunatic stuck his head out of a window and called out:

"Hello, there! Catch anything?"

"No."

"Get a bite?"

"No."

"How long you been a-trying?"

"All morning."

"Say, partner, come in and room with me."

HORACE KEPHART.

That Moose on the Railroad Track.

LAKE MEGANTIC, Que., May 11.—*Editor Forest and Stream:* Your footnote to my article regarding moose—that something must have been wrong with my first moose at the time he was seen—as moose do not carry horns—a few weeks previous to April 24. I knew when writing that article that Mr. Timmons saw the animal during the open season of last fall, and the statement that he went back a mile to find a gun I thought sufficient to show that fact, as it would not be safe for any one to shoot a moose out of season in that section of country. Mr. Timmons writes a reply to my question that the occurrence happened on Nov. 1, 1898.

WM. BROWN.

Natural History.

The Wild Pigeons.

ASHLAND, Wis., May 13.—*Editor Forest and Stream:* A press dispatch from Milwaukee says: "A large flock of wild pigeons—at least a mile in length—passed over this vicinity yesterday, flying northward; reminding observers of pioneer days in Wisconsin, when these flocks used to darken the sky in their annual spring flights."

This doubtless will carry pleasure to thousands of old pigeon hunters, like myself, and if you have not chronicled the fact of this "mile long" flight, please do so. We, who were pigeon hunters back in the sixties, all know about these large flocks, which usually passed about the 1st of April each year. I then lived in southwestern Wisconsin in Grant county, the home of your well-known friends, the Neavilles, Mather and W. Seaton. The question you have been discussing in FOREST AND STREAM, "Where have the Pigeons Gone?" used to frequently recur to me, after witnessing the flight of one of these large flocks through the sky and starting out with my gun to see where they "lit." Still, we boys used to find some quite large flocks sometimes, in the trees. The largest flocks were always in the spring. In the fall, after the acorns got ripe on the large white oak trees—what we boys called "sweet acorns"—the pigeons were on hand, especially about daylight, and for half an hour would settle down to breakfast, fluttering from limb to limb and keeping up a constant "peeping." Every morning, during the season of two or three weeks, sunrise would find me in the hunting grove, next to my father's place; the pigeons were as promptly on hand, and always about the same time—the break of day; they were as regular about this habit as the clock. My usual "bag" was half a dozen to a dozen. That meant a pigeon "pot pie," and as I would hand the birds to Bridget to "take care of," I would get a tornado of Irish that started in with, "O'f'll niver clane thim burrd; no!"—but we always had the pot pie just the same. My father had a printer working for him by the name of Hubbard, from Potosi, and my recollection is that he had one of the Neaville boys with him at our home once on the occasion of a pigeon pot pie. There wasn't any doubt about "where have the pigeons gone" after they were once served in that style by good old Bridget. There was never, to my taste, any other style of pot pie quite so nice.

JOSEPH COVER.

A press dispatch from Reedsburg, Wis., under date of May 9, reported: "There was a general excitement at Lime Ridge recently when a flock of American passenger pigeons passed north over that place. The flock being a mile long and so dense as to nearly obscure the sun. Their appearance has created interest throughout the country, as these birds have not been seen for twenty years, and even specimen hunters could not secure a single bird. They formerly roosted near Lime Ridge and came every summer by the millions to nest and breed. The people made pigeon hunting one of the principal sources of revenue in those days."

MACOMB, Ill., May 13.—*Editor Forest and Stream:* I have been trying to locate the wild American pigeon, and every attempt has proved a failure. I wrote to all parts of South and Central America, Mexico, Red River country, Arizona, Oregon, California, Washington, Arkansas, Indian Territory, and no trace of the passenger pigeon could I find. There have been a few scattering birds over the country. Five years ago three were seen here and two of them were killed.

To verify the report of the Reedsburg, Wis., great flight, I wrote to the postmaster at Reedsburg, and this is what he says: "There is no question about the correctness of the report. I know the parties, who are old residents, hunters and trappers, and who know what they are talking about. Quite a number of the birds have been seen around the hills, eight miles southwest of here, in addition to the large flock mentioned."

The question arises now, where have they been for the last fifteen years?

DR. W. O. BLAISDELL.

Editor Forest and Stream:

I can endorse most fully the statement made by Mr. Isaac Tallman in his reply to the article written by Mr. A. Meersch, and published in your issue of April 29, in which he claimed that there was a flight of wild pigeons in this county in 1895. I have been quite familiar with the game and fish of this county for nearly or quite fifty years, and during all that time I have never heard or known of a flight of wild pigeons in this county.

For many years up to about 1850 flocks of wild pigeons in the fall were quite abundant, and were very often taken with nets, which was a very favorite way of capturing them at that time, but very few if any have been taken in this manner since that time. A few small flocks appeared in the fifties, but not to such an extent that an attempt was made to capture them through the aid of pigeon nets, and I find upon inquiry that the experience of others agrees with my own.

The last flight of pigeons of which I have any knowledge occurred in the seventies, where they nested in the mountain range south of the Beaverkill in the lower part of Ulster county. There were two flights about this time, one small one and in the course of two or three years this was followed by a flight where the pigeons appeared in great numbers.

This flock had nested in Missouri in the month of April, and the most of the squabs were killed by those who were in the business of furnishing squabs for the market.

When the nesting was over the entire flock went to Michigan, where they nested again, and they were followed there by the same persons who again destroyed most of the squabs. When they left Michigan they took their flight eastward, and telegrams were sent all over that part of the country where the pigeons would be likely to nest a third time, and as soon as they settled in the Catskills these persons were apprized of the location and very soon appeared on the scene.

The party, about thirty strong, stopped at Monson's, whose house was located on the upper Beaverkill, about three miles from the nest.

This nest was a mile from the Willewemoc Lodge, where I happened to be during the whole time that the pigeons were in their roost. It was claimed at the time that the squabs were sent down to New York by the ton, but as to this I have no personal knowledge, though I do know that during the nesting all, or nearly all, of the squabs were destroyed, and this was done by invading the grounds at night and striking the trunks of the trees with a heavy axe or sledge hammer, upon which the squabs would tumble out of the nests on the ground, and be picked up and carried to Monson's and shipped to New York the next day.

I do know, however, that from a natural ice house and the ice house belonging to our club, these persons obtained not less than fifteen tons of ice for the purpose of preserving the squabs.

This is the last flight of pigeons that has ever taken place in this part of the country, so far as I have any knowledge, and I am very sure that if there had been any I would have known it.

J. S. VAN CLEEF.

POUGHKEEPSIE, N. Y., May, 12.

The Jerusalem Cricket.

Yet another animate oddity is described to me by Mr. Arthur Putnam, of San Diego, Cal., who recently spent some months in the studio of Mr. Edward Kemeys, of Bryn Mawr, Chicago. Mr. Putnam is an artist and a naturalist in his way, and he tells me of a creature of which I for one never heard before.

"The Jerusalem cricket," he says, "is a California product. He is one of the largest of his race, his average size being about 2in. long and 1/2in. wide. He never bothers anyone, but spends all his time asleep. If you turn him over in a plow furrow he lies on his back and snaps his teeth like a wildcat. Then he will struggle for a moment or two, and if not touched will turn over about as gracefully as an ice wagon and run away for a foot or two. He will hide under the nearest clod, and if you turn over the clod he doesn't mind, for by this time he is fast asleep again. Touch him on the back and he is wide awake, and at once throws himself on his back and begins to kick and bite, which is his mode of defense. In this he shows his wisdom. His head is stuck on his body like a double potato, and as he can't turn quickly or see quickly, he flops over on his back.

"In the fall the Jerusalem cricket burrows in the ground and does not come out until spring, though he does not live in a cold country. He probably does not get enough sleep in the summer, so he makes it up later on, when he can't stand it any longer.

"This odd fellow has a large round head, as large as a hazel nut, with two little black beads the size of a pin head for eyes, which are placed about the middle of his head. He has two feelers, which hang out in front when he walks, and which lie straight over his back when he is asleep. His legs are hooked on to his waist, which is short. His hind legs are long, like those of a grasshopper, but he never hops. He is clumsy and built for heavy work. In color he is light amber yellow on the head, legs and waist, his posterior whitish, covered with black or dark brown stripes, which run horizontally across his back. His hind legs are covered with two rows of thorns, which scratch a fellow pretty lively on occasion. He chews a light colored tobacco and his mouth gets very full if you make him talk. If you put him in a cup sometimes you can get him to squeak, though the sound is very faint.

"The butcher birds have a great way of hanging these clumsy crickets on the thorns of the orange trees, where they leave them to sleep it out, which they do if they are unable to squirm off. You can see their dried skeletons in dozens hanging on orange or lemon tree thorns. I have seen butcher birds follow a plow all day waiting to catch these crickets.

"The Jerusalem cricket lives on grass roots. It rarely burrows deep than a foot. It does not shed its skin as some insects do. The young are rarely seen. The adults never seem active, and rarely crawl 10ft. without a nap. They do not chirp like the ordinary cricket, and have no wings.

"I do not know that the Jerusalem cricket is a very sporty bird, except in one particular. If he discovers himself near an ant hill, he will stop short in his tracks and turn around very quickly. The ants will promptly attack him, and this he knows. He turns his big head first one way and then another as they come on, and lumbers off as fast as he can. The ants cannot get through his armor at any place, except at his waist line, where his two sections of plates lap over. The ants know this and go after this vulnerable point. Defending himself after this fashion, the big bug throws himself on his back and tries to fight off his little foes. He cannot reach his enemies with his legs very well, and in the end is very lucky if he gets off safe."

A fight of this kind is something of a sporting event in miniature. I presume, and shows nature in a serio-comic light, which is a relief against the usual somber tragedy.

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

Weight of Raccoons.

LOWELL, Mass., May 9.—*Editor Forest and Stream:* I notice in the last numbers of the FOREST AND STREAM, items relating to the weight of the raccoon, and while I have heard similar stories of coons being shot, weighing 35 to 50lbs., it has not been my luck in years' experience of hunting them to get one.

The largest I ever saw, weighed 23, 24 1/2 and 26lbs. each, all males, the first one named was shot in the Province of Quebec, Canada, and the other two in Middlesex county, Mass. The largest female coon weighed an even 20lbs., and that is as large as any I have ever heard of, although several have come to my knowledge of about that weight.

PROCYON.

FRONTON, O., May 13.—As to coons: In February of 1871 I killed a coon which weighed 28lbs. Its hide was a great curiosity. I have never since found one over 15lbs., and think the 28-pounder about twice the average size for this part of the country.

JAMES DUPUY.

Game Bag and Gun.

In the Rockies.—I.

"Come, shall we go and kill us venison?
And yet it irks me the poor dappled fools—
Being native burghers of this desert city—
Should, in their own confines, with forked heads,
Have their round haunches gored."

—As You Like It.

THE point of view has much to do with a man's enjoyment of a spectacle. This trite aphorism occurred to me a few days ago, when comfortably seated in a "Wild West" amphitheater, watching the antics of the bucking broncos. It brought back a similar scene just one year before. Then I was an actor instead of a spectator. The amphitheater was of nature's architecture.

Around us arose in serried masses, tier above tier, shoulder to shoulder, forming a perfect amphitheater, some of the grandest and most mountainous masses that form the great chain of the Rockies. The arena was a little mountain park, high on the headwaters of the Snake River, in which we had encamped the night before, our first night out. We had staged it from the railroad, Dan and I, to a far interior mining town, where we outfitted, and getting an early start pushed the pack train for twelve good hours without a stop, until at nightfall we had camped in this little park. Another such day would land us in the promised land, the Mecca of our hopes, a land of scarred, sky-scraping pinnacles, where the bands of big game awaited our coming.

But, alas! for the plans of mice and men. The blankets we had taken from under the saddles the evening before had been saturated with perspiration, the chill night air of that dizzy elevation had done the rest, and they were frozen as stiff as boards. As a consequence there was some spectacular bucking that morning in that little park, beside which the performance of Buffalo Bill's bronchos was a very one-horse affair. Dan did some ground and lofty tumbling, which I was not in a position to appreciate at the time, being absorbed in an attempt to pick out a soft place to land on. Dan said I succeeded, inasmuch as I landed on my head. The first thing I distinctly remember when I cleared away the various constellations that presented themselves to my vision was the spectacle of Dan seated on the ground with his coat split up the back, totally unconcerned about his mount, which, having bucked him off, was endeavoring to perform the same office for the saddle, but wildly waving his arms toward one of the pack horses, and yelling to the packers, "Stop that pinto! Stop that piebald son of a gun!"

As every other pack horse in the train was bucking as hard as the pinto, I was at a loss to understand his interest in this particular animal until, having mastered it, Dan dived into one of the side packs, and with a countenance and a voice that betokened the depth of his misfortune, he told us that the worst was realized, that those great necessities of life which he had brought all the way from the East—the mustard, the jam and the pickles—had formed a triple alliance. They were joined beyond power of divorce. The side pack was simply a mess of broken jars and badly mixed contents. I never was so glad in my life. Jam for Big Horn hunters—think of it! As one of the packers remarked to Dan, consolingly, "Jam may be a good thing back East, but it don't climb these hills worth a cent!" My tenderfoot companion found before he had gone far that he didn't need any condiments to make his food palatable.

We had calculated upon getting off by sun up, but it was 10 o'clock before we got that pack train straightened out, and when we did get it to moving we were too thankful to think of stopping for dinner. We had eaten all the cooked food the day before, so bacon—and raw bacon at that—with bread straight, was the menu for dinner that day, served al la saddle. Dan bolted his bread and bacon with the appetite of an Esquimo, and swore it had a flavor that John Chamberlain's terrapin wouldn't compare with, an opinion in which John would undoubtedly concur.

Despite our expedition we made poor progress. Everything went wrong. The packs kept slipping, necessitating numerous delays, and finally in crossing a stream the pony with the bedding on its back slipped, and soused under its precious burden. This was the last straw. Although it was only 2 o'clock, we gave up and made camp right there on the banks of the stream. There was plenty of wood at hand, and the guide and packer soon had a big bonfire ablaze. With their lariats they dragged up and piled together huge logs, and around the fire on a scaffolding of poles arranged the wet blankets.

Dan got out his bamboo, and said he guessed he would cast a fly or two. He would have fared better if he had cast a stone or two. The stream was clear as crystal, cold as ice, swift as a mill race, and literally alive with trout. But they did not know that Dan was harmless, so when he went through a few wild gyrations in the endeavor to cast a fly they must have construed them into overt acts of hostility. I was an interested, the packer an amused, spectator. Suspicious sounds emanated from behind the blanket, and glancing back with an expression of uneasy distrust Dan said he thought he would try a pool around the bend which looked better. Shouldering my rifle, I struck up stream, and when I got back that night Dan had a big tale to tell of a monster trout that had taken his leader and flies. Next morning the packer, while out after the horses, rescued the leader from the top of an aspen. He said the trout must have been a high jumper to have left it in a tree top.

For a while after leaving camp I threaded through the willow flats that bordered the stream in the hope of jumping whitetail deer, which use in them. But the noise necessarily made forcing my way through the thick clumps precluded any hope of stalking so wary an animal, and I struck up the mountain. The ascent was gradual, plateaus and mesas and little parks alternating with some stiff steep. Tracks were abundant, but my hunt was unrewarded with even a disappearance of deer. I stayed out later than I thought, and was sitting on a log in a little park high on the mountain side enjoying the serenity of the evening, when I chanced to

turn and gaze back down the mountain. Evening had already fallen upon the stream beside which we were camped, and up out of the darkness the sound of its waters rushing through their rocky channel seemed to strike far and faint, from the shore of another world. I started up and hastened down, little relishing the idea of having to spend the night on the mountain side, or the chance of breaking a leg if not a neck in the dark. As I sped noiselessly over the spongy turf that carpeted a gentle descent, I thought I saw some objects move in the edge of the trees, and stopped, when they seemed to suddenly disappear. Again I started, and again some thing seemed to move, and again I stopped. Brushing my hand across my eyes I started again, convinced that a cobweb or something else moving as I moved had tricked me, when out from the trees, hardly a hundred yards away, walked a big doe. I dropped as if stricken with paralysis. In the half light as I raised my rifle, and trained the sights upon her a strange transformation took place. As the doe walked she seemed to lengthen out longer and longer, and suddenly I saw with the sensations that only a victim of the mirage can appreciate—I plainly saw a third pair of legs outlined beneath this monstrously elongated deer.

I do not know whether my hat lifted or not as my attention was concentrated upon the mystery that was evolving itself before me, but I do know that the rifle barrel was wobbling about in a circle, for it was in the direct line of my vision. Like a flash occurred to me all those fairy tales of nursery days, of bewitched huntsmen, of the phantom deer that only a silver bullet could kill, and the Lord only knows what I would have done next had not this modern spook dissolved itself. It seemed to part in the middle, and metamorphose itself into a doe followed by her full-grown fawn. The fawn had been at her side when she first came into view, and gradually dropping behind had effected the illusion in the uncertain light. I drew a free breath, and saw what I could not see while my gaze was concentrated on that strange sight—a big blacktail buck standing at gaze with lifted head and titillating nostrils. He seemed suspicious. Beyond him quietly feeding were two more does. As I looked and listened I could hear them crop the luxuriant herbage.

Stretched out flat upon the ground, with my elbow at rest, I trained my rifle at the fawn with that painstaking particularity that only a man who is shooting for his supper can take. It wilted in its tracks like a wet rag. At the report the startled deer ran together, and then with long leaps went crashing into the woods. Here was meat aplenty, wood at hand and water near—I was fixed for the night. The fawn was nearly grown, weighing perhaps 100 lbs. I went deliberately to work disemboweling it. When I raised up from my bloody task I was surprised to see a long shadow fall upon the ground, and glancing quickly behind me beheld the great full moon with its golden rim resting upon the mountain's crest and flooding the scene with its silvery light. I no longer thought of staying out on the mountain, but shouldering the best of the fawn struck off down to camp. I located it while still high on the mountain side by the blazing fire, but was compelled to go down into the valley some distance above it. Once in the cañon, I could no longer see the fire, but concluded some intervening mound or rocks cut off the sight.

The real reason was the blankets which still shrouded it. While above it I could look down and see it, but when on the level it was hidden. I passed it, but getting to windward smelt the smoke and so located it. The logs had burned to an immense mass of glowing embers, giving off steady heat with little smoke, just the fire for a barbecue. Cutting green boughs we made an immense broiler, and splitting the fawn, suspended the two halves over the coals. The others had eaten one supper, but that makes no difference in the mountains. In that high, thin air your appetite is always on edge, your digestion in order, and you can eat as many meals a day as you can prevail upon your men to cook. It was nearly midnight when, wearied with story-telling and gorged with barbecued venison, we crawled into our blankets.

In the stilly watches of the night the slaughtered deer had its revenge. For the first and only time in the mountains my slumbers were far from dreamless. The peculiar experience with the doe, together with a surfeit of fawn, colored my dreams, and all night I suffered untold afflictions from phantom deer.

FRANCIS J. HOAGAN.

KENTUCKY.

[TO BE CONTINUED.]

Virginia's Eastern Shore.

BELLE HAVEN, Va., May 5.—*Editor Forest and Stream:* Having not seen anything from the eastern shore of Virginia in your valuable columns this spring, I thought I would respond to a feeling that has long been prompting me to represent our lovely section occasionally in your paper, provided you find anything worthy of acceptance.

Accomac county, on the eastern shore of Virginia, like all other sections of our coast, has donned its spring colors, and shore-bird shooting and fishing have supplemented duck shooting and field sporting. A bushel of fine trout at a tide now is a fair catch for two men. Curlew shooting is at its height, and will remain so till about the 20th inst., when they will start northward to nest. Smaller birds, viz., dowitch, plover, calico back, yellow leg, etc., will be here in maximum quantities about the 10th to 20th.

There are three clubs located on the ocean side of Accomac, one on Wallops Beach, composed principally of Pennsylvanians; one on Revels Island and one of Wachapneague. Members of the latter are down and enjoying the first of the season's sport. This club are New Yorkers, and have demonstrated considerable liberality among our people, and in return are much liked and heartily welcomed by the people. They are always prompt in paying their dues and non-resident fees, thus giving the wardens no trouble. The club has been holding annual regattas, awarding valuable prizes to successful competitors in boat races, and setting out at their commodious club house a genuine feast during the day, inviting the ashore county citizens to participate; several hundreds of them accepting. To describe the luxuries and entertainment

afforded by these regattas would take too much of your space.

Our game laws are reasonable. All non-residents must become a member of the Game Association, which costs him \$3, and \$2 annual dues. But as low as the cost is, now and then some repugnant non-residents are inclined to "kick"; yet we cannot think that any true sportsmen would refuse to pay the fee, all of which is expended toward the protection of our game.

Drum-fishing is coming on at the north end of Hog Island, between the locations of Revel's Island and Broadwater Club, the latter in Northampton county. Drum fish weighing from 25 lbs. to 75 lbs. are caught in great abundance in the latter part of May and first few days of June. Last year one boat would often bring up forty to sixty, the result of one day's fishing. It is a common thing for two or three men to be hung to different drums on the same boat at the same time, cutting and sheering the boat in all directions. As a food fish for immediate eating the drum is fine.

All of the sites suited to the location of clubs on the eastern shore of Virginia seem taken up. In fact, clubs have had considerable to do with reducing the sport of shooting, especially on our coast, from the fact that they usually locate in lands and near waters where wildfowl use most, the club habitations driving the fowl off and eventually breaking up the sport altogether in that section. The best way to preserve good shooting is sporting on the yacht system, or to go and come from the shore to the hunting grounds every day in smaller crafts.

JOHN H. JOHNSON.

CHICAGO AND THE WEST.

The Minnesota Forest Reserve.

CHICAGO, Ill., May 12.—I may state that progress is making in the matter of the proposed Minnesota forest reserve, which was taken up more fully in an earlier issue of *FOREST AND STREAM*. Col. Cooper has held some conferences which are of importance in the preliminary part of the movement, and it is hoped that not a great deal of delay will ensue in the establishment of the preliminary body. The matter seems to meet with approbation. Among other letters I have one from Mr. Charles Cristadoro, of S. Paul. The latter says: "I am glad to see the good work going on as it is. Friend Mershon is stirring up the boys in great shape from Maine to California. We must win, but will not win without a fight. It is the chance of a century of centuries to secure, as long as water flows and grass grows, a monument of the pine forests, a headstone at the graves of the departed forests." Mr. Cristadoro suggests that the following prominent gentlemen in different parts of the country are apt to be useful in this work, and are sure to be interested in the proposed movement: Hon. Knute Nelson, Alexandria, Minn.; Hon. Jas. A. Tawney, Winona, Minn.; Hon. John J. Jenkins, Chippewa Falls, Wis.; Hon. Page Morris, Duluth, Minn.; Hon. J. E. Carpenter, Minneapolis, Minn.; Hon. John M. Thurston, Omaha, Neb.; Hon. A. Y. Foster, Tacoma, Wash.; Hon. I. V. Quarles, Milwaukee, Wis.; Hon. Jas. Bixby, Muscogee, I. T.; Hon. J. S. Sherman, Utica, N. Y.; Hon. J. C. Spooner, Madison, Wis.; Hon. Chas. Dick, Akron, Ohio; A. Cristadoro, 442 West Twenty-second street, New York City; W. F. Dermot, Trout Creek, Mich.; C. R. Sumner, M. D. Rochester, N. Y.; Hon. J. W. Fordney, Saginaw, Mich.; Hon. C. D. Shelton, Houghton, Mich.; R. D. Schultz, Zanesville, Ohio.

Another writer, Mr. LeRoy Lefe Smith, of LaPorte City, Iowa, sends some comment on the region concerned, which I append:

"Your article in *FOREST AND STREAM*, relative to the preservation of the lake region in northern Minnesota as a national park, has interested me greatly. Ever since my first visit to the region at the head of the Mississippi River, I have hoped that something might be done to reserve this beautiful region from the encroachments of the timber thieves and relentless civilization.

"I purpose taking another trip about June 1 to the head of the river—this time with the intention of making further observations as to the exact source of the river, and starting from there for a long boat ride down the river clear to the blue waters of the Gulf. I make the long trip to get material for a number of articles for certain magazines. I expect also to contribute frequently to several well-known newspapers. If I am not mistaken this is the first time such a trip has ever been attempted in an open boat.

"Any suggestions you might make as to stirring up public interest in this Government park scheme, will be gladly received and acted upon."

As has been stated, forestry agitation has been going on for some time in the State of Minnesota, the last word in this regard being given in the Cross forestry bill which was passed at the last session of the Legislature. This bill was originally introduced by J. N. Cross, of Minneapolis, president of the State Forestry Association. It was presented in 1897, but defeated. This year it was passed, and is now a law. Its terms create a forestry board and establish certain State forest reserves, to consist of all such tracts of land as the State may choose to set apart, all lands which may be given to the State, all lands that may be donated for forestry purposes in fee, and all lands that may be given to the State of Minnesota by the United States. Any person donating to the forestry board a tract of 1,000 acres or more, will, under the law have this forest named after himself. It is thought that numbers of the timber kings of Minnesota will donate large bodies of denuded lands. Many lumbermen are paying heavy taxes on lands which they will be willing to surrender, there are large bodies of State swamp lands which will be apt to come in, and the United States Government is expected to contribute largely. No existing agricultural or commercial interests may be disturbed. The forestry board will be composed of nine members.

The above shows well-considered and determined effort on forestry lines in this State. I imagine that the action of the State of Minnesota would not interfere in that proposed in the National Forest Reserve. In the latter case there would be still larger donations of private land, and possibly the State of Minnesota would in turn con-

tribute territory otherwise worthless. The real purpose in all these movements is to preserve the wilderness, and in this the men of Minnesota will act as they think to the best interest of their State. These would seem to be not antagonistic to the broader proposition.

A Michigan Public Park.

The progressive State of Michigan is in no wise behind the front in any matter of intelligent progress. The Michigan Legislature has now in its hands a bill proposing the establishment of a great public park, comprising nearly a million acres of land in the counties of Wexford, Manistee, Lake, Newaygo, Oceana and Mason. These lands are to be withdrawn from settlement, and set apart as the perpetual pleasure ground for the enjoyment of the people, for the preservation of the growing timber, and for the propagation and preservation of game and fish. This park, if established, will be under the control of a commission of five members, the latter to be appointed by the Governor. Restricted building permits may be issued. Indeed, the laws governing this proposed park would appear to be similar to those controlling the Yellowstone National Park, with the further addition of the Michigan license idea. It will be unlawful to hunt or trap on the reserve, but fishing licenses may be secured, the price being \$5 for non-residents and \$1 for residents of the State of Michigan. There are some splendid trout streams included in the proposed tract, and these will be eagerly sought by many anglers, so that it is thought the license fee will raise a great fund for the necessary expense of conducting the park. I do not know what likelihood this measure has of becoming a law, but if it is passed and the park established, there would be unquestioned benefit to the State. Thus it seems that we are having the preserve idea and the license idea also offered to us in the West, and it is only fair to say that both of these ideas are advancing with rapid strides.

Wisconsin Features.

I do not know how non-residents are going to like the new Wisconsin law, but it seems to be red hot and air tight. An excellent clause is that giving the warden the right to search without warrant. Still another good feature is the improvement of the tagging clause controlling the shipping of deer. There is a strong leaning toward drawing the line tighter and tighter in shooting matters in this State. For a long time I urged upon shooting clubs in Wisconsin to place a limit upon the bag of ducks, as is done in many of the first-class clubs all over the country to-day. Many club members replied that they did not believe in limiting the bag, as duck shooting was an uncertain thing, and they wanted to kill all they could when they got a chance. The State of Wisconsin has now done a little thinking for itself, and for everybody else on this head. The non-resident deer hunter will pay \$25 license in the State of Wisconsin. The non-resident hunter for any other sort of game will pay a \$10 license. He will have to content himself with two deer or fifty birds, and if they go out of the State the hunter will have to go with them. Cold storage of game in close season is forbidden. When you look at this Wisconsin law it seems to be a mighty good one, and I hope that it will work.

Yellowstone Park Buffalo.

Mr. Ben D. Sheffield, of Livingston, Mont., a guide well known in that section, paid me a visit this week. Mr. Sheffield is in and about the Park much of the time, and is familiar with the game of that region. He tells me that the buffalo of the Park appear doomed to extinction. Every once in a while one is seen outside the Park to the south or west, and after that it does not last long. The soldiers tell him that to the best of their knowledge there are about only twenty-five buffalo left in the Park.

Killed A Grizzly.

Bill Clark, an old-time pioneer and hunter, killed a grizzly bear last week on the divide at the head of Gladstone Creek. This bear measured 9ft. across the arms, 9ft. along the middle of the back, and is said to have weighed between 700 and 800lbs. Mr. Clark says that this is the only real grizzly bear he ever saw east of the Sierra Nevada Mountains. Its fur was a dark gray color. Nearly all the mountain hunters express the same belief about the grizzly bear, and make a distinction between it and the silvertip. Thus Mr. Sheffield, to whom I have above referred, states that the silvertip is smaller than the grizzly, and that the "grizzly is never seen east of the range." The hunters and naturalists never did agree. If Mr. Clark's bear be reported correctly, it would seem to be big enough for a grizzly, for it measured more than a foot across the head between the ears. Silvertip or grizzly, it was likewise a peach.

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

The Wyoming Non-Resident Law.

Editor *Forest and Stream*:

Not long ago, in an editorial on the new Wyoming game law, you said that there was no penalty for hunting without a license. Section 14 says:

"Each act of pursuing, hunting, or killing any of the animals mentioned in this section, without a license, as herein provided for, shall be considered a distinct and separate offense."

"Any person or persons violating any of the provisions of this section shall be deemed guilty of a misdemeanor, and upon conviction thereof, shall be fined in any sum not less than \$25 nor more than \$100, or by imprisonment in the county jail not less than ten nor more than ninety days, or by both such fine and imprisonment."

Does not this cover hunting without a license?

WM. WELLS.

That's What it Looks Like.

Boston, May 1.—Editor *Forest and Stream*: I have just seen a copy of the *Brief and Woodcraft*, and I think it will be a sure winner. There is room for just such a magazine.

C. HARRY MORSE.

Seth Armitage and his Mud Shoes.

"SPEAKING of original geniuses," said Mr. Eason Beacham, manager of Park & Tilford's Seventy-second street store, "Seth Armitage, of Mariposa, Ont., holds a place all by himself."

"I spend my vacation at Mariposa, and I see a good deal of Seth, for both Seth and I are fond of shooting and fishing. Seth is nominally a farmer; but he might as well be called a horse doctor, deacon, mechanic, professional hunter or half a dozen other things. In fact, it would be hard to suggest a calling of which Seth does not know something."

"He is a great hand at praying for rain in a dry summer, and he is equally good at hauling wood for the cross-roads church in winter, and for years past no harvest bee, binding bee, logging bee or barn raising has been complete without Seth Armitage."

"When a neighbor's mowing machine breaks down or the kitchen clock gets a fit of the sulks, the things are shipped right over to Seth, and he never has any trouble in putting them in working order again. He rides a bicycle that is partly of his own construction, makes missing parts for a watch or a gun, and is as good a mechanic as he is a naturalist or herb doctor."

"Above all things, Seth loves shooting and fishing. Two years ago he was very much behind-hand with his harvest. He started one morning to cut a field of grain that was over-ripe and shucking. A friend came along

THE MUD SHOES IN ACTION.

bound on a fishing trip and asked Seth to join him. It was the kind of an invitation Seth never refused. 'Hold on a minute, till I take out my horses,' he said, 'and I'll be with you. This grain ought to have been cut a week ago, but it's stood so long now I guess another day won't make much difference.'

"The day his daughter married Seth left the wedding party on the way to the church to go on a bear hunt, and he has always considered it a piece of good judgment on his part, a sort of killing two birds with one stone, for while the girl got married he got his bear."

"Seth's hunting and fishing territory is mostly about Goose Lake, which lies only a rifle shot from his home. This used to be a great rendezvous for Indians, but now only a few come there each year. It is quite a large body of water, but its shores are swampy, and the open water is everywhere surrounded by quaking bogs that cannot be crossed by man or beast. A dog cannot even get across to retrieve ducks shot over the water."

"The lake is on the line of the wildfowl migration, and is full of ducks and geese each spring and fall. To enable him to hunt them successfully, and also fish, Seth has devised what he calls mud shoes. These shoes are canoe-shaped affairs, made of 1/2 in. basswood, 7 or 8 ft. in length. Each one is provided with a band for fastening it to the foot, something on the principle of a snowshoe thong. The shoes are very light and easily carried."

"When Seth reaches the shores of Goose Lake he slips his feet into the gearing and glides over the bogs and rushes and lily pads that lie further out much as a skee runner travels over snow. On gaining the open water, he sits down on a board laid crosswise over the shoes, and propels himself with a paddle. The shoes are then as stable and seaworthy as a catamaran."

"His gun is carried in the hollow of one of the shoes, and he generally stands erect when shooting. The shoes are exactly adapted to the peculiar conditions of Goose Lake, with its bogs and unfathomable mud, and Seth enjoys good sport at times when his neighbors can only look on and envy him."

J. B. BURNHAM.

Indians and Game.

WELLS, P. O., Uinta, Co., Wyo.—Editor *Forest and Stream*: As under existing conditions there is sure to be a fight with the Shoshones and Bannocks in the spring, I will put you in possession of the facts, in hopes that something may be done to keep the Indians on the reservation.

The Indians come in as soon as the snow will let them. Some of them have passes to hunt horses, some passes between Ft. Hall and Ft. Washakie, some no passes at all. No Indian horses range here, as they would winter kill. The Indians pay no attention to the game laws, but kill cow and calf elk.

In August last year, while I was away, a band of Indians, ten or twelve men and some women, camped about eight miles north of my place. As they were killing elk for the hides, a game warden from Wind River, named Pyle, came over, got eight men at my camp, and tried to make an arrest. The men from my camp were all tenderfeet but one, Ed. Hill. The Indians showed fight, the warden ran away at the first yell, and Ed. Hill, seeing that the Indians had them outflanked, told the boys that they had better pull out. Ed. left his gun and went over and had a talk. The Indians were very abusive and said that they were ready to fight.

All through the fall the country was full of Indians. The first week in October Ed. Hill and Nelson Yarnell came in from Wind River and reported a camp of Indians near where the row had been in August. Yarnell said that the Indians were over for trouble, so we sent word to Jackson's Hole, and fourteen men, including D. C. Nowlin, our member of the Legislature, and Wm. La Plant, the Justice of the Peace, came over. The next morning eighteen of us went up to the Indians' camp, but they had pulled out. They had three tipis out in an open park, and nine more back in the timber out of sight. This meant about twenty-five or thirty men, and it was a very pretty trap for a party like ours if we had ridden up to the three tipis and attempted to make an arrest. We scouted the country north and west to Warm Spring Creek, but could not locate the Indian camp. Albert Nelson, now State game warden, was with me in advance. There was some snow here and there, and the creeks were skimmed with ice. There was a mounted Indian scouting our advance, and the flank scouts reported the same thing. There is no doubt but that they had a trap ready for us somewhere.

Now you can see very plainly that if we want to protect our game this thing has got to stop. So when the trouble starts in the spring, please understand that we have done all we can to keep the Indians out without a fight.

WM. WELLS.

Rhode Island Game Commission.

PROVIDENCE, Rhode Island, May 11.—Editor *Forest and Stream*: I have introduced into the Senate a bill appointing bird commissioners, which I think will have a good effect, as we intend to have men appointed who are thorough sportsmen, and who are willing to do this without compensation, for the present at least. The measure reads:

"Section 1. In the month of June, 1899, and every three years thereafter, the Governor shall appoint five commissioners to serve without compensation, one from each county of the State, to be known as Commissioners of Birds, who shall hold office for three years or until their successors are appointed."

"Sec. 2. The Commissioners of Birds shall protect birds throughout the State, and shall cause to be prosecuted for the violation of the provisions of this chapter and of the laws of this State concerning birds. Said commissioners whenever complaint is made by them or either of them, or by their deputies of a violation of any of the provisions of this chapter, shall not be required either by themselves or by their deputies to furnish surety for costs or be liable for costs on such complaint."

"Sec. 3. Said commissioners shall appoint such number of deputies in each county as they shall see fit, and shall issue commissions under their hands to said deputies, empowering them to execute the duties of such office and shall record the names of said deputies with the Secretary of State. It shall be the duty of every such deputy to arrest without warrant any person whom they shall find taking or killing, or shall have in their possession birds contrary to the provisions of this act."

"Sec. 4. Any deputy appointed by the Commissioners of Birds as hereinbefore provided may, without warrant, seize any birds found in the possession of any person at any time when the killing of such birds is prohibited by law."

N. F. REINER.

Mastigouche Club.

President H. W. Atwater, of Montreal, sends us a copy of his annual report to the members of the Mastigouche Fish and Game Club, whose preserves are at St. Gabriel de Brandon, Province of Quebec. In the course of the report he says: "We are on a sound financial basis (something exceptional with clubs of our description). A large amount of work of a permanent character has been done through the season to put our property in good working order, and all tending to the actual comfort of our members. The lease from the Government has been renewed for a further term of ten years. They have also granted us permission to take fish from the lower reaches of the river to stock the lakes above the Great Chute. By this means, in a few years' time, our fishing territory will be doubled."

"The house committee have closed up 'Lac Eau Claire' and 'Lac la Chance' for the space of two years, and inasmuch as our territory comprises a large number of lakes, they propose to gradually continue this rule to all the smaller lakes. In this simple manner, along with the restrictions put upon members relative to the size and number of fish to be taken, a very short time will elapse before our lakes will abound with fish, and we may look forward to having a preserve that will be hard to equal, even in the land of Canada."

"The house committee propose to open the club house ready for the reception of members on May 20 next, and they hope to have a good representation of members present."

Sea and River Fishing.

A Homily on Angling.

BY CHARLES HALLOCK.

WASHINGTON, May 1.—The angling season is backward this spring like the budding, the plowing, and the planting; and in the high latitude of natural trout streams where these winsome fish do most lurk, disport and use, from Maine to Wisconsin, the lakes are still ice-bound, and snowbanks linger in the deeper shadows of the forests. It is even so on the Brule, in the superlative domain of Winneboujou, that eminent angler's patron, where the St. Paul Club has been wont to open camp each year on May 1. And Fred Mather, the author of "Men I Have Fished With," writes from there that patches of snow remain where the harbinger blossoms of the trailing arbutus are beginning to show in the birch woods. Fred has just entered upon the administration of Cedar Island Lodge, where Mr. Henry Clay Pierce, of St. Louis, has most extensive trout preserves and propagating works, with no end of such home and scenic attractions as unlimited wealth can procure. At different times I have been his guest, as well as the guest of the hospitable Winneboujou.

Just where the stream divides, the drooping birches drop the larval parasites which breed in their branches among the hungry trout which gather in the rough waters of the spring rise to catch the flotsam of the current, and many a 2-pounder, yea, a 4-pounder, has been captured, *secundum artem*, at the confluence of the reunited waters. And up and down the river, for miles above and below Cedar Island, the stream flows in alternate pools and rapids, beside which the rustic cottages and æsthetic club houses have been located, with here and there a hostelry for the public. All the trout fishing in the Brule is done from boats, and each of the various river craft must have its skilled boatman to pole it up the rapids, to hold it on the riffles, and to shoot the falls, just as is done on the salmon river, Restigouche, in Canada; as well as to make noon camp and broil a mess of fish as the guides do among the Thousand Islands of the St. Lawrence in midsummer.

It is a knackful accomplishment to pole a skiff or bark canoe up a rapid stream, requiring not strength so much as dexterity and a knowledge of the stream's ever changing moods and caprices; for if the current but catches the bow in slightest deflection from the line of direction, she swings broadside round, and is swept ruthlessly back to quiet water, only to essay the ascent again. Under such stress, a novice in a canoe will be apt to lose his head and upset; for such a craft is totterish at best, and one must learn to get and keep his balance, like a tight-rope dancer, or a pupil at a riding school. All the same, there is a slightly lass of fourteen, city bred, and daughter of a self-exiled valetudinarian living just below the Northern Pacific Railroad crossing, who learned in two years' time to rival the most dexterous of the local aborigines who guide for Winneboujou. I have seen her put a 15 ft. loaded canoe up the stiffest rapids on the river, to the irrepressible admiration of newcomers, who could not comprehend by what knack or magic so slight a person could accomplish such a feat, any more than they could realize, until they learned by what dexterous turn of the wrist an expert angler fastens to a darting trout.

And this reminds me that there are always at every angling resort lots of fellows who come to the river side in the full-fledged belief that they are gifted, and discover at first effort that they are practically *hors du combat*, and that even a little child can lead them.

No young rooster ever had his comb cut with such compunction of abasement and inconsequence! Helpless but reliant upon the hope set forth before them, the wise among them are fain to intrust their lives, and the fortunes of the day to this self-taught maid in short skirts who deftly plies the push-pole; and when they return to the landing at sundown with a goodly mess of average trout, more, indeed, than they ever stood godfather to before, they feel that they have undergone an experience as novel and instructive as it was exhilarating.

There are several ladies in the Winneboujou Club who are deft with the paddle and rod, of whom the three daughters of ex-Mayor C. D. O'Brien, of St. Paul, are noted. His home crew of eight oars and a coxswain constitute the most striking summer feature at White Bear Lake, when it turns out for a sturdy pull over the regular course; all to the manor born.

Now if I might add a word by way of homily, I would assert that it is easy enough always to discover an experienced angler without looking into his mouth. Some pretenders may have the written code at their tongue's end, whereby they daze and overawe the unsophisticated neophyte; but they never can deceive a veteran. An expert can read them offhand. He can detect their deficiencies and shortcomings the instant they enter for competition. All of us can tell a horseman at sight by the way he approaches an animal to take the rein or put foot in the stirrup. So it is with him who handles rod or paddle. An apparently insignificant movement will give him away. Likewise with the man who takes up a gun or axe, billiard cue, foil, or Indian club; who steps into a carriage or boat, or enters a drawing room. Ignorance cannot be disguised. It is the companion of awkwardness, and the two go always hand in hand.

Assuredly, bookish wisdom and finical acquirements do not make the fisherman. An angler with superfine tackle and toggery may astonish the callow by his professional make-up, but unless he understands the habits of the fish and the character of the water he fishes, he will make but a poor fist of his angling, and a good deal more is included in a knowledge of habits than consists in the mere superficial understanding of what fish eat, how they abide and what will attract them best or bring them most surely to creel. If it be true of forest haunts of game, it is equally true of the brooks, that too much beating about the bush defeats its ends. The silent hunter or angler and quiet methods, secure the goodlier results. A tyro's fantastic manipulation of the rod will scare more fish than it will bring, while all his frequent changing of flies, in-

volving disconcerting body movements, will only lessen his chances of filling his creel.

There is a closer analogy between hunting and fishing than many people affect to believe. I am always surprised when I do not perceive a sportsman of repute exercise the same caution in approaching the denizens of rivers as the fauna of the forests. The ostrich with his head in the sand is not more foolish than the man who fancies that the fish cannot see him because he cannot see them. A practiced eye will detect a motionless fish or a glancing flash in the stream where one who is unaccustomed will fail to discover it after it is plainly pointed out. One should approach an eligible part of the stream with unvarying discretion, even though it appears to be barren. Hundreds of so called anglers ruin their chances at the outset by the clumsy manner in which they approach the timid creatures which they propose to entice and lay hands on. If market gunners behaved in like manner, utterly ignoring the first principles of "drawing on game" which bird dogs practice so well, our city epicures would get no woodcock or canvasback ducks.

If opinionated tyros only knew by what great painstaking fish baskets are sometimes filled, they would discover that they have something yet to learn in order to attain the acme of high art. For example, the inevitable farmer's boy of the epigram will crawl on his belly for 20 yds. in order to get a big trout from under the banks, and ten to one he will yank him out. Herein he develops several attributes of a true angler. He is familiar with fish haunts and habits, and he exercises caution and patience, without which success would be impossible. It is by the application of these qualities that the tow string is able to discount the silk line and reel. Books cannot impart the practical information which that lad possesses. I once met a party on the Nepigon in August, who had been fishing all the choice places along shore where fish abound earlier in the season, and had taken none. I took them in a canoe to a riff in mid-stream, where a small island divided the current, and they caught a bag full. You see a man may be a prize winner at a fly-casting tournament, and yet have no "luck" on the streams, because he doesn't know their changing moods and tenses.

It is not my purpose to discuss low grade and high grade angling in these desultory lines. Of course, a masterly cast with a fly will pick up fish which a gob and wattle cannot reach. We all understand that; and we have long been familiar with the logic which, from the days of Saladin and Cœur de Leon prefer dexterity to brute force. I am simply trying to show where those who attempt to practice high grade angling are deficient and fail, and that many who talk by the book are but bunglers in the art. One chief reason why many come short is because they don't keep their eyes on their work. I do not believe that a short-sighted individual can catch as many fish as one who has perfect vision. He must miss a great many fish that rise. A fly-fisherman in particular should keep his eye on the water. It should follow with constant vigilance the vagaries of his flies. He should take up his line as seldom as possible; be sure always to strike the instant he thinks he detects a gleam. I have trout fishing especially in mind while I write. It is *sui generis*, whatever may be said of fly-fishing in its general application to fish of other sorts. With respect to salmon, the rule of striking at sight does not apply at all; quite the reverse being the practice; the same with black bass. The motion of a trout is often quicker than the glance of the human eye, and unless the angler is on the alert the trout will have seen and investigated the lure before a contemptuous flap of his tail has made the angler aware that he has come and gone. Often an upward lift of the rod tip will hook a fish whose presence was not suspected at all, the barb fastening to its tail, side, or gill. Such incidents as these give rise to the speculation that trout knock flies into their mouths with their tails.

Books are filled with high art methods and systems of manipulating artificial flies, all of the impressionist style of dictation, just as we have in metaphysics the higher criticism and the higher law, but the teachings are exogenous and heretical, and the strict constructionist of the old school will catch the most fish.

One object of wading a stream (presuming the banks are as practicable for casting as the bed) is to avoid observation. A man in full view on the bank will empty a pool in a jiffy. Every trout will take to its lair. Proper wading is the most deliberate operation imaginable. A good wader will scarcely roil the water in a mill-tail. He will often pick up a score of fish without moving more than a couple of rods. The fish will so little heed him that they will sometimes play about his feet. I have often waded through a school collected in a long reach of water waist deep on a midsummer day when the sun was bright, and picked out now and then a fish; and then getting on the banks well back out of sight, and returning to the head of the pool, fished it through a second time with tolerable success. Wading also enables the angler to cover water which he could not otherwise reach, and it permits him to fish with a short line, say, 30 ft. from reel to tail fly. Long distance casts are a mistake, because the line is not then in such complete control, and the energy of the effort to deliver it scares the fish. I seldom attempt an inordinate cast except when fishing with minutest flies on calm, broad water. Under such conditions only is the ability to deliver a long line an enviable qualification. A slight ruffle on the surface is worth 20 yds. of distance.

There is a great difference between stream fishing and pond fishing. From a boat a long line is the proper thing. A 30 yd. cast of line evenly laid out at a fly-casting tournament is an exquisite performance, but the accomplishment is seldom of practical use in angling, except for salmon. The essence of the art called gentle is to know how to find the trout first and then to present the lure as naturally as possible without exciting suspicion. Perhaps, after all, the stage of water, the time of day, and the season of the year, are not considered as much as they should be? If one fails at one hour, let him try another part of the day. In August only the early morning and the dusk of evening are likely to yield satisfactory results.

I remember once an amusing incident at Seaman's Pond in Ridgewood, Long Island, where a visitor was permitted to fish for the liver-fed trout which were in the habit of rushing *en masse* after what was thrown in at feeding time until they fairly made the water boil. The

figure of a man on the bank had no terrors for them then, though they were a little shy on off hours, and of course our ambitious angler took a fine trout at the very first cast. If he had had a "trot line" carrying a score of hooks, he would have taken a fish on every one. After playing him well to creel, so as to enjoy the suspense which contributes so much to the enjoyment of sport, he cast again, expecting a repetition of the previous rush, but nary rush ensued. A fingerling or two broke gingerly at his tail fly, but the most persistent persuasion failed to fasten another trout.

Hæc fabula docet that dead failures are possible in the best stocked waters, and that the shoemaker is worthy of his last; or words to that effect.

Trout on Broadhead Creek.

I AM a plain, blunt man who loves my country, and my friend. I have reached that period in life when, like Cicero, I love to recall the pleasures of a well-spent life, and if there is any part of my life I would willingly omit, it is the several years I spent in reasonably close contact with the "scurvy politicians who pretend to see the things they see not."

I seldom get beyond bait fishing—the red worm or the shining minnow. I do not pretend to be an artist in fish. Fred Mather is! But even he comes to the rescue of a bait-fisherman when occasion offers.

When the May sun began "to shed her amber light the new-leaved woods and lawns between," my blood was alive with the inspiration to be derived from a few days of "the contemplative man's amusement" in far-off Monroe. Nothing but flounders were biting at Anglesea, N. J., though the dogwood tree was in blossom. But one morning I found a letter on my table from Price Bros. of the Spruce Cabin Inn, up in Monroe county, Pa., saying, "Come at once; trout galore."

I took the noon train that day for Canadensis, Pa., the station where the fisherman gets off for the Spruce Cabin, a telegram having told my old friends, Price Bros., that I "was on the wing." But I must tell you how I found this beautiful spot twenty-four years ago, that has been so near my heart ever since.

William King, a nephew of Judge Edward King, President Judge of the Philadelphia Common Pleas, first introduced me to the trout of Monroe county. The amiable Judge King left a handsome estate to William, his nephew, who was a brilliant and brave naval officer, and a member of the old Philadelphia Club at Thirteenth and Walnut streets. William King understood as much about spending this estate as the historic Judge knew about saving it.

William King, something of a satirist, laughed at my \$5 lance—now pole—and noticed that I carried no miller nor Jock Scott flies, but was voluminously funny at my tin bait-box.

"Will you fish, Colonel, with the red worm?" said the naval swell.

"Certainly," I replied, "and I will beat you two to one."

"No you won't," said Lieutenant Commander King, "not for a \$25 dinner at the Philadelphia Club."

"Done," I replied. "We begin to-morrow at 8 A. M., each man have an attendant; fishing to last for six hours."

King was to try the fly and I was to try the worm—no minnows allowed. The naval officer's rig from stem to stern was something beautiful to behold. Including rod and reel, dress, and a long book of every known fly, prepared by Keider, of Philadelphia, his outfit must have cost \$250.

I said to Milton Price, then only eight years old, "Can I beat this fish dude?"

"Yes," he said, "I'll get the worms to-night; I know the holes where the trout live, and we'll just wax the shirt off of him."

This encouraged me somewhat, but the case looked ominous. I was up by light, and with my good-natured and confident friend breakfasted at 7 A. M. on trout, coffee, buckwheat cakes and maple molasses.

King had secured a strong-limbed country boy, and we were off on time. Only one pole for each party, and one line to be used. I was limited to Broadhead Creek, Stony Run and Goose Pond Run, and King was to go up Broadhead Creek, then to Mill Creek and Buck Hill.

This was the great piscatorial day of my life. Milton Price knew every pond where the *fontinalis* disported and every laurel bush that grew on the side of the pond where the lusty trout did dwell.

We improved the time. When I was sure of a good spot I waded in up to my neck, and was sure of some return. I had an ordinary summer suit on, and I knew King would not spoil his \$60 Wanamaker suit after all the trout in Monroe county.

When tired out I would lie under the flowering rhododendrum (laurel) bushes and let Milton Price catch all that was left. I slipped over stones, fell over the roots, caught one trout that weighed 2 lbs., and at 1:30 P. M., little Milton said, "Colonel, we will stop now, we've got that dude beat." And we stopped, rested long enough to get our breath and started back to the Spruce Cabin farm. We had a royal bunch of trout, strung on a crooked stick, just forty-three in number.

When we reached the hotel we were wet, tired and hungry, and up came Lieutenant William King of the U. S. Navy. He had two trout as long as your finger for his six hours' work! He sighed as he took one glance at our healthy string, and cried, "Peccavi, I've lost my bet, boys."

He swore young Martin Price on his affidavit, now a lusty grown man, that we two had caught the forty-three trout, and expressed himself satisfied.

The next week he put up the dinner, and no one who has not dined at the Philadelphia Club can fully comprehend the comfort of that memorable dinner. Perhaps that experience, and limited opportunities to catch trout, have kept me a bait fisherman ever since. Deep-sea fishing has been my successful hobby.

Nature has done a great deal for Monroe county. In October and November this is the greatest county in Pennsylvania for grouse. A law has been passed prohibiting the selling of grouse in the State, and this helps the shooting immensely.

The main stream for good fishing is Broadhead's Creek.

but not far away are Mill Creek, Buck Hill, Middle Branch, Levis Branch, Goose Pond Run and Stony Run, all in good condition, and a patient fisherman is sure of his reward.

Many of the fishermen bring their wives, and my pen is not lithe enough to write fully of the lavish friendliness of nature to this county of Monroe. Here is the spot for the fisher to come. Pike county has to withdraw and pale its ineffective fires before this brightest spot in old Monroe.

A very agreeable gentleman, Charles Stokes, of the Stock Exchange, New York, is here for a month. He came in with twenty-five trout during the week, but amused us very much by his experience with a big red bull of Farmer Wagner's. He had just "bagged" a one-pounder when the bull gave him chase. He dropped his fish and gathered a pile of stones and began to fire at the bull. When he would hit the bull it would become more vociferous than ever. Stokes says it was the most interesting exhibition of "Wagner's" music he had ever heard! Finally one well-delivered blow with a big rock on the knee drove the bull off, and Stokes had time to fly. He was, so to speak, fenced in, and says he felt like the negro when chased by a bull, he cried as he ran, "Millions for de fence."

JAS. MATLOCK SCOVEL.

MONROE COUNTY, Pa.

New England Spring Fishing.

BOSTON, May 13.—There is plenty of spring fishing in Maine waters, but somehow the catching has not yet been up to expectations, if indeed it ever is. Great interest is felt in the Rangeley waters, and the long-time early visitors are many of them at their old haunts. At the Oquonoc Angling Association camps there are quartered Mr. F. A. Turner, president of the Association; Mr. John Woodbury and others. Mr. A. G. Mann and wife and Miss Lena Mudge are at the Birches, same lake. At Haines' Landing fishing parties have begun to arrive. Mr. Rosse Babcock, J. N. Wells, J. E. Adams, Jr., New York; Edgar R. Lewis, New Bedford; H. A. Damon and party, Fitchburg, Pa., are expected at once. The Ackerman party was the first to arrive at the Upper Dam, consisting of B. J. Ackerman, Brooklyn, N. Y.; S. Cohen and G. G. Sufferen, New York. Mr. Ackerman has taken a trout of 5lbs., with several smaller ones. The party took over twenty trout in one day early last week. Mr. Ackerman has visited the Upper Dam some twelve seasons, missing a couple of seasons, including last year. He fondly expects to come up to his old records, which are among the largest. The Brackett and Clark party was also one of the first to get to the Upper Dam, including W. D. Brackett, C. P. Clark, J. H. Emery and Rufus Brown. This is the twenty-eighth season that Mr. Brackett has fished at the Upper Dam, and the twenty-fifth season that he and Mr. Clark have fished there together. This is doubtless the oldest consecutive fishing friendship on record. The fishing success of this party has not yet been up to former seasons, since the water is the highest ever known, and in both Richardson and Mooselucmaguntic lakes are millions of smelt; many of them dead from spawning. The trout are "just gorging" on these smelt, and will not take to artificial flies or other bait till the smelts are gone. Still a few trout are being taken.

Senator W. P. Frye went up to his cottage on the rock, head of Mooselucmaguntic, on Wednesday, and out again on Friday, only making the trip to see that his place is in readiness for Mrs. Frye and guests this week. They hope to spend a good deal of time there this season. The Senator was deprived of his usual fishing outing last year, by reason of the Congressional session. He was telegraphed to by President McKinley, when in the Maine woods, to come out and take a place on the Peace Commission. His first impression was to decline flatly, but he reflected as to what the country would say if it was found out that he declined so important a position for the sake of fishing and shooting in the Maine woods. That decided the matter. Mr. Frye is a fishing enthusiast, and a fly-fisherman altogether, never employing any other method. He tells many a good fishing story. Among his latest may be noted: Last year he was on a board of some sort of Congressional investigation. A California judge was one of the witnesses, and made a good one. After he had testified he came to Mr. Frye's seat and said: "I see you don't recognize me, Senator." His face was very familiar, but Mr. Frye could not place it. The name was given, and mention made of the Maine woods. Behold, the judge and one of the first guides Mr. Frye ever employed on Mooselucmaguntic Lake, over forty years ago, were one and the same man. Inspired to get an education, doubtless, by the character of the man he guided, the State of Maine young man sought and obtained an education, studied law, went to California, and hence the judgeship. Congratulations were mutual, and both agreed that fishing had been of great advantage to them. Massachusetts Fish Commissioner Buffington, of Worcester, has gone to Haines' Landing on a fishing trip. He has fished the world over, but usually goes to the Rangeleys for his spring trip.

A. E. Morrison, of Rumford Falls, and Freland Howe, of Norway, are at the Upper Dam for their usual spring trip. Mr. Howe has fished at that point for many seasons. Camp Prospect, Richardson Lake, is open, and the proprietors and guests are at hand, among whom are F. O. Walker and Mrs. Walker, Dr. and Mrs. C. M. Bisbee, Rumford Falls; J. F. Chute and lady, Portland. Dr. H. C. Haven is at his camps on Beaver Island, Richardson Lake, and Mr. Herbert Leeds, of Boston, is soon expected as guest. Messrs. John E. and Bayard Thayer are soon expected at their Birch Lodge, head of the lake, and doubtless they will go thence to B. Pond for fly-fishing. There they will inhabit the camp Gov. Russell so much loved, when in life. Harry Dutton, wife and two daughters and H. E. Russell and wife were the first to arrive at Bill Soule's Pleasant Island camps, Cup-suptic Lake. Mr. V. F. Prentice, of Worcester, was the first to arrive at the Mountain View House. Mr. R. A. Tuttle, of Boston, and party, are due at Lake Point Cottage. C. P. Stevens, of Boston, who had such great success with landlocked salmon in Rangeley Lake two years ago, is at his camp, "Vive Vale," Narrows, Richardson Lake. He has been there for a couple of months,

superintending the building of additions and making his camps more of a summer home. His guests have begun to arrive, including Mrs. Stevens and maid, Mr. and Mrs. C. F. Thurston, Mr. W. W. Lee, Mr. Hayes and Mr. Prior. They will fish the Narrows, and some big catches are always to be expected from this party.

Glowing reports come from Webb Lake, in Weld, Me. J. M. Holland, of Dixfield, and Edward Stanley, of Boston, have made a good catch there, including twenty-three trout and two salmon. P. R. Doble, of Beverly, Mass., has taken six trout and four salmon. Guests at Pine Point camps also include W. W. Wait, Dixfield; S. P. Gonga, Stanley Bisbee and D. C. Holway, Rumford Falls. This party took three trout weighing 8lbs. Philip Andrew has taken nine trout. P. S. Ladd has taken two trout. With lower water, it is expected that fishing will greatly improve.

Some good reports of trout fishing continue to come from the Cape. Grover Cleveland and A. H. Wood, of Boston, landed eighty trout on their early trip to their preserves in Sandwich and Sagamore. Mr. Cleveland is reported to be delighted. Wakeley Lake has given some fine trout this season. One weighing 4lbs. is reported and a Boston angler has caught several weighing from 2 to 3½lbs. Edward Lowell, of Boston, and friends are building a club house at Catuit Point. Several brook trout have been taken by this party of over 2lbs. At West Barnstable good success is reported on leased waters.

At Newfound Lake, N. H., good success is being reported. Geo. H. Fowler, of Bristol, is one of the more successful fishermen. On Tuesday he caught a salmon of 3lbs. and five trout of 3, 3½, 5½, 9½ and 11½lbs. respectively. Other good catches have included: Chas. E. Rounds, two trout of 2½ and 11½lbs.; A. G. Dolloff and Frank Greer, four trout of 6½, 7, 10 and 12lbs.; J. Elwin Robie, 10lb. salmon; E. Towne, two trout, 11 and

DR. TARLETON H. BEAN.

12lbs.; Clarence Merrill, 3½lb. trout and 10lb. salmon; F. L. Eames, of Boston, two trout of 9¾ and 10¼lbs.; Harry B. Cilly, Manchester, two salmon of 9½ and 3lbs.; Dr. A. I. Ballou, trout of 15lbs.; Levi Woodbury, Natic, salmon of 2½ and 8½lbs.; Parker Hancock, Franklin, two salmon of 7½lbs. each; G. G. Fellows, Franklin, salmon of 2¾ and 8¼lbs.

From Mashpee come reports of good trout fishing. The following Boston fishermen have been down there and made good catches: L. B. Morse, G. B. Balch, L. C. Haskell, Joseph Russell, Waldron Bates, M. L. Sanborn, Howard Butler, R. C. Watson, Edward Hodges, S. Henry Hooper, James A. Fowle, W. G. Russell and J. G. Reed. Henry Cobb and William J. Follett, of Newton; Geo. Warwick, of Cambridge, and Robert Harrington, of Winchester, have made some good catches in both lake and river at Mashpee.

SPECIAL.

Dr. T. H. Bean.

As has already been announced in these columns, Hon. Ferdinand W. Peck, Commissioner-General, has appointed Dr. Tarleton H. Bean director of forestry and fisheries to the United States Commission to the Paris Exposition of 1900.

Dr. Bean was born in Bainbridge, Lancaster county, Pa., Oct. 8, 1846. He entered the State Normal School at Millersville, Pa., in 1864, was graduated in 1866, and was then appointed acting professor of natural history. He was engaged in teaching nearly nine years, and in 1874, while principal of the High School of Wilkesbarre, Pa., joined the United States Fish Commission and remained in the Government service until 1895, passing through nearly every grade of advancement up to the position of Chief of the Division of Fish Culture.

In addition to his other duties, Dr. Bean was the honorary curator of the department of fishes in the United States Museum, and for eleven years edited the publication of that museum and of the United States Fish Commission. In 1876 he received the degree of doctor of medicine from the Columbia University, Washington, D. C., and in 1883 the honorary degree of master of science was conferred upon him by the Indiana University. In the same year his ichthyological publications won him a medal at the London Fisheries Exhibition.

Dr. Bean was associated for many years with his preceptor, Dr. J. T. Rothrock, Forestry Commissioner of Pennsylvania, and worked in his herbarium. He has been a close student and teacher of botany for many years and has made collections in Alaska, Siberia and many parts of the United States.

Beginning with the Centennial Exhibition in 1876, he has had a varied and full exposition experience, both at home and abroad. He was the representative of the United States Fish Commission on the Government Board at the World's Columbian Exposition, and served there as a juror in the group of zoology. He represented the Fish Commission also at the Atlanta Exposition. He is best known as the author of works upon ichthyology, and especially reports upon deep-sea fishes, the fishes of Alaska, the Gulf of Mexico, New Jersey, Pennsylvania and New York. He has also published many papers upon fisheries and fish culture and the management of fishes in the Aquarium. From 1888 to 1893 Dr. Bean edited the fish and fishing columns of FOREST AND STREAM.

In 1895 he accepted the office of superintendent of the Aquarium in New York City. He rebuilt and successfully opened the Aquarium and remained in charge of it until 1898. He has now nearly completed an extensive work upon the fishes of New York, which will be published by the New York State Museum.

The Silkworm.

THE silkworm, everyone knows, is a caterpillar, which produces silk. Its natural food is the leaves of the mulberry tree; it is produced, or born, from a small egg about the size of a pin's head, and when full grown is from 2 to 4in. long, according to the breed. The small breeds are shorter lived than the larger, therefore, I will speak in such a manner that the treatment is to be understood as suitable for any varieties. It is necessary to procure good eggs, and those imported from the south of Europe have the preference. Silkworm's eggs in this country should not be hatched before the middle of May, or even later, and they should be kept cool until then or they are liable to hatch before; even before there be leaves to feed the interesting little insect. The later the hatching the more plentiful and good have the leaves become.

Artificial heat is necessary to hatch the eggs advantageously, but that heat must be administered gradually day by day. A small room with a stove in it or a fireplace, so as to have a regular command of it, is the best system.

The eggs should be placed in gutters formed by doubling papers several times, an inch wide and placed on a table, in perhaps a sieve or tray as the most convenient thing. The natural heat of the room is to be gradually increased five degrees of Fahrenheit daily until seventy degrees is reached, at which heat the worms will in a few days begin to show themselves, running up the paper gutter, which are extended and fixed sufficiently open.

On the top of the gutters the youngest mulberry leaves, because the most tender, are to be laid, and when the worms have got thereon, they are to be removed to a sheet of common paper, without size. A whitish-brown paper, I think best. Silkworm's eggs will hatch naturally, but the artificial heat is used in order to produce a more regular development of all the worms together.

All the little black insects generally issue from the eggs two or three consecutive mornings. They are very active and soon find their way to the leaves. During the whole course of rearing, the temperature should be maintained (a little over or under) seventy degrees, night and day. The night temperature, however, may be the lowest, rather than that of the day. No particular harm will arise by its fall below even sixty degrees, other than retarding the growth and appetite of the worms. Sudden changes from heat to cold produced by incautiously admitting sudden drafts or damp are harmful. Continued damp is peculiarly injurious.

It is important to keep the room supplied with pure air by regular ventilation admitted gently; by means of ventilators would be the best system, but in default of them the door of the room can be left more or less open. The air is best admitted through other apartments, and not directly from the outside, excepting in occasional circumstances, when the external air is sufficiently warm and quiet. The worms hatched each day are best kept separate. The first may be placed in the coolest part of the room, to retard their development, and the last by being placed in a rather warm corner, will eat more, and develop themselves quicker, and thus by spinning time, all will arrive at perfection more nearly at the same time.

Young silkworms require feeding at least every five hours daily, and from the last meal at night to the first next morning it is desirable to let not more than six or seven hours intervene; not that the insect would materially suffer, but their progress is impeded. Silkworms will not die, even if three or four days without food, though this would be a piece of cruelty.

On the mulberry tree in its native climate the insect has always leaves to eat, and is surrounded by pure air. Let us imitate nature then in rearing these useful little creatures.

Find it very useful during the young state of silkworms to cut the leaves tolerably fine and drop the same gently over, most covering them. The insects then, all alike, can immediately begin to feast thereon by reason of so many fresh edges being presented to them to attack. It is important that none of your stock lose time in this respect, or they cannot grow equally alike.

The worms properly attended, viz., fed regularly and kept in the temperature named, will soon show signs of their first sleep or change of skin coming on, toward the end of the sixth or seventh day.

During this torpid state, the insects eat nothing, and only those behindhand in going to sleep require feeding in frequent small sprinklings in order to push them along and get them into that state as early as possible with the foremost. When this state is approaching, the insects fall off their appetite, and a smaller quantity of leaves is administered in proportion, as it is seen to be unconsumed. The worms when asleep will be observed to be stationary and motionless, with heads erect. Previously to this state they have fixed themselves in position, having spun over the leaves, etc., below them, some fine silken webs, to which they secure their feet. These webs are not perceptible to the naked eye, but it is now important not to disturb or touch the insect, for it is absolutely necessary that this position be preserved until they have shot off their skins, which will be in a couple of days, when feeding again commences.

When all have changed their skins, they should be supplied with young whole leaves, and when they get on these they may be transported thereby to a clean sheet of paper and their old bed of dry leaves, excrements removed, but be careful not to touch the insect with the fingers, for they would suffer from the contact. Silkworms shoot their skins four times at about the same intervals as already named.

It is desirable to explain that silkworms are the better for having plenty of room to crawl about, therefore, they should never be allowed during growth to be laid thick. As a general guide, between every two, there should be at least space enough for a third, unoccupied.

The second age of silkworms last about six or seven days, during which time they are fed as before, with cut leaves, until the second sleep and change of skin occur. On the fifth day of that age, I recommend moving the insects to fresh, clean paper, and the clearance of the old leaves and waste, etc., for nothing is so conducive to silkworm's health as cleanliness. This will make their second sleep more comfortable and tend to prevent diseases.

This cleanliness must never be neglected before and after every sleep; and when the worms get larger, it must be effected oftener, as it is then of more consequence.

The second sleep lasts like the first, about two days, during which time the insects eat nothing. It is, however, generally necessary to supply small quantities of leaves, either to worms not yet asleep or those just awake. The latter can be removed to fresh paper by themselves as soon as they get on fresh whole leaves, by which to be lifted away.

Thus, feeding regularly and keeping the silkworms clean, maintaining always temperature of about seventy degrees and keeping up proper ventilation, will enable them to arrive at the third sleep and change of skin as before stated, in about seven days; after which it is not necessary to cut the leaves so fine, when feeding them; indeed many persons give them entire, but I fancy they are better cut or coarsely chopped, using a clean knife always.

After this third sleep, the insects begin to grow a goodly size, and of course eat more, producing a greater quantity of excrements and litter, which should be cleaned away, for the least putrefaction thereof causes the air around to become unwholesome and impedes their respiration. The necessity of this will readily be understood, when I explain that the worms have as many as eighteen breathing holes, viz., nine on each side of their bellies; pure respiration and cleanliness therefore are important to their health, neglect these breathings and disease makes its appearance.

Every time silkworms are cleaned out, especially when getting large, they require nearly double the space to occupy, so that they may crawl about, without mounting or suffocating each other. By adopting these attentions the fourth or last sleep and shooting of skins will be satisfactorily accomplished.

After this the worms, if in health, become quite ravenous in appetite, and should be constantly supplied with whole fresh gathered leaves, as fast as they can consume them; at least, they should have a good meal, almost covering them with leaves, every four or five hours. Nothing is got by stinting silkworms in food, with the idea of economy for that would be acting in a pennywise and a pound-foolish manner. Let it be understood that during this age the worms grow rapidly, and their food becomes converted into serical matter in their bodies, fit for spinning out; therefore withhold not food, if you desire to have a fine crop of cocoons.

It is customary on the Continent, when cleaning out the worms, to lay over them twigs of mulberry, a foot or more in length, by which to remove them to a clean allotment of space; this is an excellent plan, and there are always many young branches that may be removed from the trees or bushes with advantage.

I cannot here speak of the proper method of cultivation of the mulberry, which is a subject by itself, and deserving particular attention. I am writing for those who have mulberry leaves at command, as all must have before being able to rear silkworms with satisfaction. And the proper sort of leaves too, for be it understood that the black variety generally grown for the sake of the fruit, is not used in foreign countries for feeding silkworms.

The white varieties of mulberry are the best and most generally adopted. I brought out one kind grown in the Alpine district of Italy, which is much esteemed, because growing fine from the seeds without grafting. This variety produces very excellent leaves, and the plants do well in this country; they are very hardy, and have stood the test of severe winters. It is then just as easy and wiser to plant the proper kinds than to continue silkworm feeding with the wrong, as is too often done at present.

If silkworms are removed by hand when cleaning them out, they should be touched delicately, and if I may express myself, in a loving manner. They should never be pulled forcibly away from the leaves, branches or other things to which they may be attached by their feet. They should be cleared out every two or at least three days, when they are getting large.

In about ten days after the fourth change, if all has been properly attended to, the insects will have arrived to maturity, and fit to mount and spin, and must immediately be supplied with material for the purpose. It is fashionable to curl paper thimble form, for silkworms to work their cones in; but this, although an excellent plan with a few, would not be sufficiently expeditious for a great number.

In the southern parts of Europe it is customary to prepare a kind of open-headed broom, made of different dried branches, etc., without thorns, into which the worms go and spin. I have found oak twigs, broom, garden cress, which has run to seed, tops of turnips, shavings, old flower stems, etc., very suitable for the purpose. These materials may also be laid all round the back and sides of the shelves or stages on which the worms are, without making brooms, or they can be laid in rows 8 or 10 in. apart across them. Those worms not requiring more food will soon repair to such things, where they will enclose themselves in their silken habitation.

Silkworms, when arrived at maturity, present a beautiful transparent golden hue, particularly at their necks,

which is easily observed by looking at them against the light. They are to be seen running about as if in search of some retreat, a fine web of silk may be seen issuing from their mouth, over the leaves which remain uneaten. Those worms not finding spinning quarters themselves may be taken gently and placed against the materials provided. The cocoons will be finished in from four to six days, and the change to the chrysalis state will be completed by the eighth, when the crop may be gathered by detaching the cones; and having cleaned them of the floss or waste silk around them they are ready to be reeled, with the exception of any retained for reproduction, which should remain as they are, until the insects make their way out in form of moth, male and female.

Eggs having been laid for the continuation of the progeny.

Those cones intended for reeling, if to be kept, before being subjected to that operation, must be baked in an oven, hot enough to kill the insect, without injury to the silk, for once perforated they are spoiled for reeling. From the time of the completion of the cones, about fifteen days more or less to the appearance of the moths may be reckoned, but their coming forth depends upon the temperature.

I would make a few remarks about the shelves or stages on which to keep silkworms. In those countries where great quantities are reared, erections are fitted up with several tiers of stages about 18 in., one above the other. In Italy such a building is called "il castello," or castle, and generally constructed to contain worms, from either 20z. or 10z. eggs, or in numbers about 20 to 40,000. The latter quantity of worms would consume about 2,000 lbs. weight of leaves.

Not many (if any) silkworm rearers here in America at present require such a building, but if silkworm rearing is to become a profitable employment, as I believe it will, many of such may become requisite; therefore, I may as well describe my plan of erecting the same.

Four posts, 3 in. in diameter, are placed firm and upright between the floor and ceiling of the room, previously having holes drilled in them 1 in. in diameter, 18 in. apart, the same distance from their bottoms, and 3 or 4 in. more from their top, next the ceiling. Into these holes, drive inch pegs, 6 in. long, which are to support the tables or stages, much in fashion of a four-post bedstead, by being set in pairs, with the pegs facing.

The stages themselves may be constructed with 12 ft. 1 1/2 in. splines, forming the sides, and connected by inch crosspieces 4 ft. long at 18 in. apart, which are nailed thereto, thus forming a frame 12 ft. long and 4 ft. wide; over these bars, inside the frame, wire net with 2 in. meshes, may be fixed, or simply wire drawn over, either of which will support the paper containing the worms; but I like best to bed over the frame some reeds, which make a more solid table, and the air passes between the interstices.

Here I wish to explain, that it is important, whatever be used to construct stages for silkworms, that the materials should be such as admit the air through the paper containing the worms, as it tends to keep their beds drier and less prone to fermentation, so detrimental to them.

A similar kind of building may be made on a smaller scale, without the posts extending to the ceiling, but then they must be provided with the feet, in order to stand steady. Such a thing may be constructed with every neatness and polish, even for the parlor if desired, but I have considered cheapness and use only.

The Japan breeds of silkworms lately introduced are rather shorter lived than those usually adopted. They produce fine silk, and because of their less liability to disease are becoming general favorites, although very small.

Another occupation besides rearing silkworms, would be the reeling of silk from the cocoons for commerce. This on the Continent is the business of the reelers, but here in America at present, the amateur alone reels his own silk; but he does it in a way which most invariably renders it unfit for manufacture. When the rearing of silkworms in this country is effected more largely, reeling houses will soon be established.

If the quantity of cocoons be so great that they cannot all be reeled before the time the moths would appear, they must be baked in an oven heated to 180 degrees Fahrenheit, placing them in baskets, which process destroys the chrysalis in about an hour. Another method is to steam them, as is done with fish, potatoes, etc., for about twenty minutes.

After this is done, the cones should be laid thinly on shelves, through which the air can play, to dry them. Thus they will keep until reeled by occasionally turning them, having an eye to prevent depredations from insects.

The first process in reeling is to find the ends or threads of the cones by whisking them a few times in hot water below boiling point, with a small hand whisk, made of fine twigs of the common broom or other fine elastic material. The silken webs adhering to this are drawn by it and the hands until the true ones are found and run clear and free.

The webs of four to six cocoons go to form a thread. The quantity of cocoons employed in the production of a pound weight of silk varies according to their quality and kind. The larger cocoons run an average of 10 lbs., and the small Japan will require from 12 to 14 lbs. to produce 1 lb. of reeled silk.

The number of silkworms also will be in proportion from 250 to 500 to produce a pound of cocoons, or even more if very light.

The worth of a pound of silk varies according to the price in the market, from \$10. \$14 to \$18, I suppose at the present time, according to the little quantity produced. In the reeling houses in Italy, the average day's work for a woman and girl to turn the reel is six hanks of silk, each containing about 30z. The day is divided into three equal parts, viz., from daylight to nine, from nine to two, from two till night.

The water in the basins, which should be soft, should be changed at least once in the day, as cleanliness helps to maintain a gloss on the silk. Double cocoons, or those spun by two or even three worms, are very difficult to reel, indeed the produce from them is inferior and coarse; breakage often occurs by reason of the inequalities, and the cones as twist can only be made three

or four times, instead of many, so that the thread is not so finely compressed.

At the reeling house at Pegli, near Genoa, which I visited, the reels are worked by water power, and eight cocoons are reeled at one time, viz., four to each thread, but at a house in Piedmont, which I went over, five were used, and I was informed that sometimes six were adopted when a larger thread was required.

A. V. MEERSCH.

The Trout Killer.

I AM a literary man. I have read my Izaak Walton and have been soothed and charmed by the descriptions of that gentle angler. I have recently turned angler myself, and I know more about fishing now than I did when I began. I feel that the world should get the benefit of my experience, not that the world will care much about it, for it will probably be indifferent to this experience, as it has been to everything else of mine, but a man after all owes something to his kind, as well as to his other creditors, and I cannot help insisting on conferring this benefit on the world, even if martyrdom comes to me or to my readers.

I always like to start a paper of this kind in a conscientious way. It may become famous. For aught I know it may turn out a second "Complete Guide to Anglers," and it is well, therefore, to go into details for the benefit of the novice in fishing. First of all, I soon learned that you must be very particular about your outfit. I found that out, not by myself, it is true, but through others. My friend, who had invited me to a month's trout fishing, and whom I shall call the Sport, told me so to begin with, and the men who sell outfits told me so time and time again, with each call that I made upon them, for it was not long after my invitation before I sought an outfit. I went first, of course, to get a fish pole. The man I struck, who was in the business, was an angler as well as a dealer, and he said decidedly, correcting me, they kept rods of all kinds. I asked him if I could catch fish with a rod, and he looked at me critically and said he did not know; he thought it was doubtful, especially if there were no fish, but that with a rod and a net, he thought I could probably snare them. I told him I thought myself that a fish pole and a seine would be sufficient to catch what I was after. He then hauled down pole after pole—"rods," he still called them—miles of them and put them together one after another. I found a good long, heavy rod and told him I thought that would be strong enough for what I wanted; I selected a good heavy line and sinker, and some large hooks that appeared sharp and dangerous, and asked him what he thought of that for trout. Heavens and earth! shall I ever forget the look he gave me! "Trout! Trout! Why," he said, "I thought you were selecting for tarpon or shark!" "Oh, no," I replied, "I may not have mentioned it before, but plain, simple everyday trout is what I am invited to catch." I asked him what he usually sold for bait to trout fishermen. "Bait? Bait for trout? No sportsman ever uses bait!" He spoke and acted like a man who was hurt in his feelings. "Of course," I said, "I know worms are always in order—I am sportsman enough for that—but what I want to know is when you cannot get worms, what kind of bait do you sell for trout?" He seemed tired of my conversation and answered shortly "flies." "Oh, I see," said I, "when you can't dig worms you catch flies! As a sportsman I always did like to dig worms and clams, but I never could catch flies; what am I going to do?" He said, "Well, you see, real sportsmen use artificial flies!" "Great Scott!" said I, "do real sportsmen deceive the trout by not giving them the real thing? Betray their confidence and let them, like the scurvy politician, seem to see the thing they do not, and go for it?" I could not help asking, "Don't you consider this immoral? An imposition on the trout?" He deigned no answer, but pulled down a case containing millions of impossible moths and flies and bugs of all kinds. It then occurred to me that my friend, the Sport, had written to me to get some flies for him when I came along, but I supposed he meant the flies of commerce—to raise blisters with and such things—and I was going to order them of my chemist. I looked at this entomological collection with interest, and said I thought from what I had read that March hackles were fitting to trout and that I would like some of those. "March is past; it is now late July," he replied, to which I added, "Yes, but the trout I am going to catch would be fooled just as badly in August with a March fly as in any other season; when I fool them I want to go the whole figure." No answer to this, but only the remark, "You are going in August, you say; well, you will want that and that and that. Now, there is a fly, that is a sure killer in August," said he, adding to my collection a magenta and sky blue moth with a pink tail that would not deceive a babe, let alone a trout. "That's a sure killer," he said with enthusiasm. "Does this kind of an insect when living go after the trout and bite them to death that you speak of it as a sure killer?" By this time I was simply bewildered, for my enthusiastic friend paid no attention to me whatever, but simply went on talking to himself. "An 8oz. steel rod—that's best for him; silk lines, leaders, reels, fly-book and flies, basket, a light landing net, eight and four are twelve and four are seventeen and three are twenty-three dollars in all. There you are, all complete, and I hope you will have good sport." I gladly paid the bill, for he said he would send everything properly packed for transportation, and I left him in a state of pleasurable excitement. Next to get my boots.

My friend the Sport had said, "You will want high boots—rubber, unless you prefer to wade the streams in thick shoes," which I didn't. It was rather a hot day to try on rubber boots, but I did it all the same. "How high are these boots?" said I to the India rubber man. "Eight dollars," said he. "I mean," said I, "how high up do they come?" "Depends on the man," said he. "I am the man," said I. "They would go over your head," said he; "that pair was made for a man twice as big as you are. You want something like this," and he pulled down a pair that did not go above my waist, only reached my hips. "Are these high boots, fishing boots, sportsman's boots, trout fisherman's boots—that's the kind I am after, and I want to be sure of my outfit." He assured me they were all these, and more too, and so

I paid his bill—the goods to be packed for transportation.

Well, all things considered, I finally got my outfit within reasonable limits, and when I shook off the dust of New York from my feet, I already felt an exhilarating sensation, as an angler should, and I really pitied people in New York who were not anglers, and the trout lazing away their time in fancied security in deep pools under gently swaying alders 'way off, where I was going, and I could hear the running brooks finding their way to the sea, and I dreamed of trout.

In due time I reached my friend the Sport in the land of trout. I shall not tell where this land is, for no sportsman gives away his pools. He may be in all other things truthful and confiding, but as to the place where he gets his trout he will give points in lying to Ananias or a discount in silence to a deaf mute.

The Sport was a real sportsman and not an amateur. He had got wet in every river and brook, and in every lake, within a radius of sixty miles, and had deeply studied the haunts and ways of the salmon and the trout, and had been scratched by every overhanging bush and briar in the country. I longed to show him my outfit, and after the first welcome was over I asked him if he had ever studied entomology, for if he hadn't he was about to begin. I showed him my fish pole (rod) and my fly-book; he said the rod was all right and my flies well selected, and pointing to my magenta-colored sky-blue moth with the pink tail he said, "By Jove! you have been very fortunate in that one. You have got there a sure killer." That was the exact language of my friend in New York. I told the Sport I had selected that one myself, because I knew that its bite was fatal to trout. He said, "Likely enough, especially when dead." I did not understand this remark very well, but as time was short I did not press my inquiries. I showed him my boots. He asked whether I was going to wade in them. I told him "No, that I was only going to wear them!"

At last the day came on which I was to show the stuff I was made of. My friend the Sport did not look very well dressed when we started off. His boots were high up, quite to his hips, muddy in spots, and there was an evident, not to say an obtrusive, patch in the seat of his trousers, which became conspicuous from time to time under his bob-tail monkey jacket, as he stalked along. His wide-awake hat was hopeless—ornamented with flies of various kinds, and pulled into any shape that sun or rain had made convenient. My thought was that he would certainly scare the trout, and I wondered whether I ought not to go alone. Never shall I forget the excitement I felt when, with the assistance of the Sport, I put my rod together and adjusted the reel and ran on my line, and fastened the leader, and then my first fly—the sure killer, magenta, sky blue and pink, and never did warrior hear the cry to arms with greater joy than I heard the quiet, subdued voice of the Sport saying, "Cast your fly into that pool, I'll not fish just yet, I'll wait till I get you started." "Cast your fly into that pool" was much like saying to me "Cast your bread upon the waters," or "Bring me a mountain from the moon," or "I'll thank you for a piece of that sun spot." It was not that the pool was so far off, for it was not 20 ft. away, and I had been told how I ought to do it; but my leader was so crinkly and got curled up so easily that, though it was well soaked before I began, I could not get it out a foot from the shore. I grew hot and desperate, and finally tried a back cast, swinging everything high up and back at the same time, and then I got a bite. I had caught the upper branch of an alder that swung gracefully over the edge of the brook miles away until I had caught it, and then I found it was near to. I climbed on to a rock near the alder and reached forward, and grasped a lower branch, and was pulling it toward me, as I had read such things are done, when my foot slipped, my rod dropped and my reel, getting unfastened, fell into the dark water under the rock, unwinding itself as it sunk to the bottom.

I sat down to consider the situation. From the position of my fly in the top of the alder, I was evidently catching birds; from the position of my reel at the bottom of the pool I was after fish—a long way after them, it is true, but after them—and all between the two extremes was tangled line around rubber boots and fish pole rod. It seemed hopeless. But after study I went to the bird's nest end of my line, and after breaking through all sorts of underbrush and climbing up and down everything and getting into mud and gurry till my rubber boots were plastered, and slipping over, boots and all, in the slippery mud and water of the bank, I rescued my magenta, sky blue pink-tail sure killer. I then took off all my clothes, dove for my reel and recovered that; dressed again and began anew my preparations for casting into that pool.

I had never till that day associated bird's nesting and trout catching together, but experience, that great teacher, soon taught me that if I could not see my fly drop into the pool, I might be sure of finding it either up a tree or in the seat of my trousers. At times I really forgot whether I was after birds or trout. Trout fishers are philosophers. The Sport sat on the pebbly strand and noiselessly laughed and cried by turns at my efforts, advising, assisting, it is true, but utterly indifferent to my sufferings.

I grew tired at last of that pool and of that alder. Your true angler always expects to get a fish in some other pool, and I was no exception to the general rule. I told the Sport I thought I would try my luck elsewhere, and sat down beside him quite exhausted with my efforts. He said, "But you have not cast into that pool yet where the trout are; you have only been around the edges, and hardly that." I said, "There is not a trout in that pool, and there never has been one; I have been into every tree within a mile of it, and I ought to know." He took up his fish pole as I said this, and first looking behind him, gradually threw toward the pool; the click of the reel at every new cast showed he was paying out more line. It was good to see him as he swayed his rod over his right shoulder only a little out of perpendicular, and then with a sway forward away would go the line, gradually unfolding, and then the leader also gradually unfolding, and while you were wondering about the fly, down would drop noiselessly into the middle of the pool, the bit of silk and feather, which, on touching the water, became alive and strug-

gling for life as you know by its hasty movement across the water. No wonder the trout could not stand it. Nobody could. Of a sudden I saw a streak of light, the rod stiff in the air a little over his right shoulder and bent nearly double, and the Sport standing like a statue, waiting the next move of the trout, for that there was a trout I had no doubt; a whirr, whirr of the reel, and then a click, click of the reel, then a splash and a jump, a break out of water, and a whirr, whirr of the reel, followed by the click, click. I got so excited I could only walk the strand and wonder why he didn't haul him in. Patiently, noiselessly, now shortening his line, now letting it run, the Sport hardly moved from his place till I heard the sudden and continuous click, click, and the line got shorter and shorter, and at last an open-mouthed trout came toward us, the Sport drawing back slowly nearer and nearer where I stood, and then with a quick turn of the rod, brought the fish to his side, and next ran him up the pebbles of the shore. I thought when the fish was working the way it was that it must be as big as a halibut, and I was surprised when I found that a trout weighing a pound and a half could make such a row.

I immediately became possessed with a passion for trying it again, and the Sport at once acceded, waded in with me nearer to the pool, and patiently directed my movements. All of a sudden I became blinded and had my fish pole nearly wrenched out of my hand, as the Sport said to me in a low voice, "You've got him—hold your rod up; hold your rod up, I say! Don't let the tip down, hold it up!" My rod would not stay up; I could not get it to stay up. It bent and bent, and the point would sway from side to side, and my line began to go off in spite of me. "Hold your rod up; give him the butt; don't let the line slack; reel in; keep the pressure on him steadily all the time. Let him take the line off the reel; now wind in—slowly—let go again; he's a buster. Hold your rod up—up, I say; keep the pressure steady and strong all the time, that's what tires him." Well, that's what was tiring me. After the first five minutes I began to hope that the fish would get off, but then I got my second wind, and a most intense interest and excitement possessed me. I wanted to see that fish, but he was sulking somewhere at the bottom of the pool. I thought of taking my line over my shoulder and walking ashore, pulling the fish after me; but I was afraid of the Sport, who had now resumed his place on the pebbly beach, and was watching the fray, calling out in a low voice from time to time, "That's better! Keep your rod up; up, I say; don't let him get any slack anywhere; there he breaks! That's good! Reel him in toward me, gently—gently, plenty of time; don't let him get round that snag. There he goes, round the snag." I said to the Sport, "Do you mean to tell me I have been catching a snag all this time?" But the Sport had no answer; he had walked into the water and come out with the snag in his hand, which he threw ashore, so I could not reach it again, saying, "He's on still; good; it was close, but he's well hooked; take it easy, keep your rod up—up, I say! Now swing him in, swing him along; shorten line, not too fast; lots of fight in him if he sees you or gets into shoal water. Gently, swing him toward me; I'll gaff him—or here's your new net, must land him with your brand new tackle from New York. Gently, gently—so; hold your rod up! Here you are, my beauty!" A swish, a passing of the net under a beautiful thing in the water, and I was on the beach in front of my spoils. I immediately began to sing, "Lo, the Conquering Hero Comes!" The Sport said I was a good singer, but that trout were unappreciative, and then I threw myself on my hands and knees, letting my fish pole lie where it would on the strand, while I examined this my first victim of misplaced confidence.

I counted the spots on him—he was so plump and beautiful and cool, as if he had been living in an ice chest. I was surprised to find he was not bigger. I certainly thought he must weigh a ton, and the singular part of it is that he seemed to me to grow smaller and smaller as I remembered the size I thought him when I had not seen him, and the size he was when I did see him. That's why we always lose our largest fish! The Sport said I had done nobly, and then and there he dubbed me the Trout Killer. I took that trout home with me and weighed him. I held the scales myself. He weighed just 2 lbs. and 10 oz. My education was finished. I had learned in one day the two great virtues of an angler—patience and lying in weight.

HENRY M. ROGERS.

The Salt Water League.

NEW YORK, May 9.—*Editor Forest and Stream:* I am now satisfied that the objects of the League of Salt-Water Fishermen will meet with success. There are hundreds of fishermen in and about New York who would take an interest, if it were well put before them, and I must say that we are making great strides in that direction. There are some who will say, why deprive the net fishermen of their daily bread? But no such thing is liable to happen, and we wish it well understood too, as this League wishes to do nobody an injustice. But we shall stick to our rights and furthermore get the best that can be got in the way of justice to fishermen who toil all day, as I myself have to do for a living. But I want a little outing now and then, to drive dull care away, and so do a great many others. And like myself, they go off on little trips to the fishing grounds (which nowadays are very hard to find). But as we all know, and we have a number of proofs of it, net fishermen care naught for the laws of the State, but destroy everything and anything in the line of fish that may chance to come into their nets. We also have a number of proofs of the pollution of the waters, which matter is being brought before the proper authorities, and I am sure it will be looked after and stopped.

Now, as to the part of the people who say that we are depriving the net fishermen of a living. Take, for instance, Jamaica Bay, which was a great place for the netters in late years. But a law of 1898 compelled them to stop it, and this is in fact the only place where fishing is allowed on every day of the year. The cry was that they were going to starve if stopped; but what has happened there instead? They are buying or

building small boats for the money they used in former years for their nets, and the consequence is that in some places they cannot accommodate their patrons. This is just and only because the fish are there now in plenty. Wherever fish are to be caught, there you will find fishermen. And let me tell you, the proprietors of fishing resorts are looking to us now to keep up the good work. But that is not all. They are stumbling over one another to become one of the delegates of that particular section to help us in every way; for they say it is the best thing that happened. The netters are being taught what is right, and at last they approve of it.

Now, again you take law No. 139, 1898, Mr. Rudolph Hoffman, the game protector, one of the new board of directors, has this to say: "Last year he had destroyed twenty-four nets, two fykes and one pound, and now, so far this year, he has failed to find one. He is a hustler. They stopped, for they fear him, and the result is that the fishermen are catching more fish there, as the reports show. It is the same all over, and by the end of the year they will be pleased to have us pass the bill which we will present to the Legislature."

Hon. Theodore Roosevelt, Hon. Grover Cleveland and others have accepted honorary membership in this League, and in their letters to us, they promise to help us in every way possible. We are arranging for a series of mass meetings in and about New York to enroll and enlighten those who do not readily understand where we are at. Due notice will be sent you of our next one.

I am now very busy appointing delegates to the various assembly districts, who will have the power to appoint two assistants to help them, and organize their own branches before the fall. Following is a list of those appointed thus far, as branches.

- No. 1. Wm. Roebor, office 329 Eighth avenue.
- No. 2. Frank A. Owens, office 11 Atlantic avenue, Brooklyn.
- No. 3. Joseph Bins, office, 705 Greenwich street.
- No. 4. Fuch's, office 22 Delancey street.
- No. 5. Thos. Reilly, office, 209 West 107th street.
- No. 6. Col. Jas. F. Milliken, office, 31½ West Thirtieth street.
- No. 7. Alfred Rogers, office, 276 East Tenth street.
- No. 8. A. H. Baer, office, 350 East Fifty-first street.
- No. 9. A. Baywood, office, 2094 Third avenue.
- No. 10. Wm. Bjur, office, Eldret Dock, Hammels Station, Rockaway Beach.
- No. 11. J. F. Marsters, office, 55 Court street, Brooklyn.
- No. 12. J. F. Marsters, office, 800 Broadway, Brooklyn.
- No. 13. Capt. F. Baerem, office, Whitestone, L. I.
- No. 14. C. S. Crane, office, 1160 Broadway.
- No. 15. Comellas, office, 251 Washington street, Brooklyn.
- No. 16. H. Taxter, office 315 West 116th street.
- No. 17. Jos. Steiner, office, 309 Broadway.
- No. 18. Chas. Fuller, office, Broad Channel, L. I.
- No. 19. M. Fitzgerald, office, Great Kills, Staten Island.
- No. 20. Hon. Dan O'Reilly, office, 28 Fourth place, Brooklyn.
- No. 21. Sam Howard, office, 302 West Fifty-second street.
- No. 22. Rudolph Hoffman, office, 3156 Third avenue.
- No. 23. M. S. Newcorn, office 110 Park Row.
- No. 24. Dan A. Nesbitt, office 376 Amsterdam avenue.
- No. 25. G. Kissinger, Jr., office, 270 West Nineteenth street.
- No. 26. J. Lewin, office, 121 Chambers street.
- No. 27. J. Lewin, office 103 Reade street.
- No. 28. G. P. Morosini, Jr., office, Riverdale, N. Y.
- No. 29. Adolph Minck, office, 55 Beaver street, Brooklyn.
- No. 30. J. Franz, office, 1782 First avenue.
- No. 31. Sam Nordenschild, office, Madison Square, N. Y. P. O.
- No. 32. F. Fadding, 60 West Eighteenth street.
- No. 33. John Jefferts, 86 East, Third street.
- No. 34. Isaac Smith, office, Princes' Bay, S. I.

Others will be appointed later on. Please impress it on the readers that we want fishermen and friends to help us by becoming members, a very small cost, indeed.

T. BIEDINGER, President.

Canadian Fishing Season Open.

QUEBEC, May 13.—Never has the oldest inhabitant in this north country of short springs experienced such a sudden leap from winter to summer as we have had here within the past few days. We have seen 6 ft. of snow disappear in some exposed localities in as many days. Several days before the last of the snow had left the city streets the thermometer was registering nearly 85 degrees in the shade. The buds on the trees are quickly developing into full leaf, though there are still good quantities of snow, and will be for weeks to come, on the site of the more sheltered of the city's winter dumping grounds. Of course, the rapid advance of the season has brought on the opening of the angling waters much earlier than was anticipated. The heat of the sun rapidly thawed the snow upon the icy covering of the lakes, and under the pressure and influence of so much water the ice has rotted and disappeared almost everywhere. On Lake Beaport and other waters in the neighborhood of the city, the ice went down in the middle of last week. Nearly a week ago some good fish were taken with bait in Lake Beaport, and yesterday several rises at flies were reported. On Monday last, the same day that the ice is reported to have left Moosehead Lake, it disappeared from Lake Edward. This is fully a week earlier than anticipated. A message received here this morning reports that the large trout of Lake Edward have commenced to take quite freely. The same news comes from Lake St. Joseph. In all these waters the angling is usually good almost as soon as the ice disappears. The Messrs. McCormick, of Florida, have already taken up their summer headquarters at the Laurentides House, Lake Edward, whence they will make angling excursions during the summer to various surrounding waters. A number of New England fishermen are expected at Lake Edward next week. A few local knights of the angle went up on Thursday to their preserves, on the limits of the Laurentides and Stadacond clubs, but so far no reports have been received from them. Several American members of the Triton Fish and Game Club are due here this afternoon on their way a-fishing, having been wired to some days ago, as soon as the ice went out.

The Kenogami Fish and Game Club, which was only formed last year, and which secured some of the best of the waters between Lake St. John and Chicoutimi, has erected a comfortable club house on Lake Long and looks forward to a fine season's sport. It is expected that its membership will fill up very rapidly, many of the shares having been already taken up by Quebecers. Capt. Wurtele, of this city, has been elected president in place of Mr. Savard, M. P., of Chicoutimi, whose parliamentary duties tie him down a good deal to Ottawa.

I am expecting to hear almost daily that the ice has gone from Lake St. John. The snow upon its surface had melted several days ago. There will undoubtedly be

good fishing for ouananiche around the shores of the lake and also in the estuaries of the southern rivers during the fourth week of this month. It is too early as yet to speculate upon the opening of the season in the Grande Discharge, because it will depend largely upon the amount of rain that falls between this time and the second week of June, and the period at which the spring floods of the lake subside.

The unusually high waters expected this spring in consequence of the sudden appearance of hot weather and the large amount of snow in the woods are hailed with considerable satisfaction by salmon fishermen, many of whose rivers were spoiled last year by the late running of logs. This year everything promises well for an early and successful running of logs, and lumberers and anglers are both happy in consequence.

E. T. D. CHAMBERS.

CHICAGO AND THE WEST.

Western Trout Season.

CHICAGO, Ill., May 12.—Our trout season is now well under way, and within the past week has been turning out a great success. The spring has been very late in the pine woods country, as it has at this latitude, later in upper Wisconsin than in the Michigan south peninsula. Ten days ago a series of heavy rains brought the angling industry to an end in Wisconsin, but for four days past the weather has been beautiful the streams have cleared and the trout are rising beautifully.

One of the best trips made by Chicago people thus far was had by Charlie Antoine, of Von Longerke and Antoine, and Edward G. Taylor, author of our much-mooted "Taylor system." They fished the Prairie River for five days, and toward the close had some great sport, though they were caught for two days by the rains and high waters, which spoiled all the fun and kept the fish down. The swamp water filled the Prairie until it was too deep to wade. Shortly after that the weather cleared and the stream ran down, and at the time Charlie came home the fish were rising splendidly. I need not say that it was with great reluctance he turned his face homeward. He tells me that cowdung and brown hackle were the best flies, though they used coachman and Rube Wood to some extent, and on one day the Abbey was good. They took some very nice trout.

Mr. William Cooke Daniels, of the big dry goods house of Daniels & Fisher, Denver, Colo., came to Chicago all the way from Denver in order to have a little fishing for trout. Mr. Daniels was adjutant of one of the regiments at Santiago, and is recovering from the Cuban fever. He has fished in pretty much all corners of the world, and came here deliberately to try the trout of the Middle West. He has taken many trout in Colorado, of course, but says he does not like it there, for the fishing is too easy, so that anyone can float a line down stream and take trout. Mr. Daniels is an expert fly-tier and is very fond of dry fly-fishing, at which he served a long apprenticeship in England. Not being acquainted in this part of the world, he inquired of Spaldings' house here, and Mr. Hirth referred him to me, and I referred him to the Prairie River, where I am sure I hope he will make a pleasant addition to his trouting experience. Later on he may go over into Michigan and try for the big rainbows there. At the present time all Michigan is devoted to rainbow chasing. First it was the grayling, then the brook trout, and now the rainbow is the article of angling commerce most sought for. It is conceded that the rainbow outfishes the brook trout, but is not comparable to the latter on the table. I imagine, however, that Mr. Daniels will care more for our brook trout fishing as a novelty.

Mr. Fred N. Peet, of the Chicago Fly-Casting Club, is back from a rattling good trouting trip in the south peninsula, where he met his old friend, Mr. John Waddell, of Grand Rapids. Mr. Peet says that he found some streams running into the Pere Marquette where the fishing was all that could be asked. The wading was good and the fishing comfortable, and they took trout up to 2½ lbs. in weight. Mr. Peet is in love with the south peninsula trout country, and will not go anywhere else. I need not state that he has the rainbow bee very firmly implanted in his bonnet.

Mr. H. L. Stanton, of this city, will leave soon for St. Paul on a business trip, but will go via Wisconsin, and admits that he is sorely tempted to stop off and have a session with the trout. We have few more ardent trout fishermen than Mr. Stanton, though of late he and his friend, Mr. Frank Willard, have taken to muscallunge fishing. Mr. Stanton was born at Horicon, Wis., and he was one of those who saw the Kekoskee bullhead eruption near that place. He says he has seen his father sink a bushel basket in the water and dip it out full of bullheads, and continue this until he had a sled load of fish. He has seen seventy-five wagon boxes loaded in one day in this way. He saw pickerel thrown out of the water with potato forks in great quantities. Later in the season, when the ice had cracked on the main lake, the fish got air and scattered out again away from the air holes.

South Peninsula.

The opening of the trout season in Michigan south peninsula came under a very bad condition, a heavy rain on the day previous to opening day having ruined the streams. This was followed by high wind and colder weather, so that for the most part the army of fishermen who went out on opening day were more or less disappointed, though some good baskets were taken.

The Pere Marquette Club, on Kinne Creek, celebrated opening day, of course. This stream is short and clear, and so full of trout at the opening of the season that their tails stick out of the water. Messrs. W. B. Mershon, of Saginaw, and Mr. John Morley, were on hand, of course, but did not reach the club until noon. The former put twenty-four nice ones in his basket that afternoon, and followed it up by forty-five on the following day. The club members took about 450 fish in all on opening day, and the trout expressed regret that they were not more gentlemen on hand to oblige them in their wish to be taken in out of the cold water. That is a wonderful stream. I am not advised at this writing whether Mr. Morley operated the Montreal fly with

which he did us all up at the time I was there, but it may safely be guessed that he was doing business with some sort of fly. Mr. Morley is an up-stream fisherman, and it is uphill work to beat him.

The Little Manistee is one of the crack streams of Michigan, and has been from the grayling days on down. It is reported that there were fifty fishermen on the Little Manistee on opening day, and several parties have gone in there to camp for the season, some of them, I fear, with the purpose of marketing trout. I have seen such parties along that stream, though it is fair to say that they did not seem able to catch enough trout to spoil the river. The best reaches of that river are not easily accessible from hotels, and your genuine trout angler is not favorable to wasting time off the water. Baldwin, Mich., seems to be the great entry point for the Manistee system, and many good waters are accessible from that locality. This is the town to which our present Mayor, Carter H. Harrison, went in the good old grayling days, when he was a frequent visitor to Michigan.

Mr. W. J. Hooper and A. Bush, of Baldwin, fished the Little South on opening day, and killed about forty trout apiece, in spite of conditions none too good.

Mr. A. J. Bradford tried the Middle Branch, and he found it very productive, killing sixty trout.

The Baldwin River comes into prominence this season and seems to be very well stocked. Mr. Clarence Weavers took forty-three trout there on opening day.

Among flies which seem to be useful in Michigan south peninsula this spring are the Cahill, grizzly king, queen and hare's ear.

Bait Killed the Flies.

It is a theory which may perhaps be supported by facts, that bait fishing, if long continued on a stream, will kill the water for any sport at fly-fishing. The use of a spoon hook is still worse, in the opinion of many. Thus, Mr. Daniels, of Denver, tells me that the Gunnison River, of Colorado, which was once a splendid fly stream, is now a very poor one, though productive to bait fishing. I do not know how accurate this may be in general, but I may say that the best fly stream of which I have personal knowledge is one which has not been fished for the market for some time, and which has happened to be fished chiefly in late years by fly-fishermen in the great majority. Of course, there is great temptation to drop a worm now and then if the trout are not rising, but if we follow our religion to the limit it would seem that we should refrain from all but the fly, lest we kill the virtue of the fly. At any rate this is doctrine which will not work to the detriment of the fishing.

How to Bring Trout Home.

It was Mr. Mather, I believe, who spoke about keeping flies in a fruit jar, which I should think would be a very excellent method. There might be some danger in their getting served as preserves if company came, but this is so slight that it may be overlooked. The fruit jar is a good thing and a preserver of good things. A friend of mine who has just come back from a trouting trip has shown me another one of its uses. He had a big glass jar, with the cap screwed down tight, which he had brought along covered with ice. The jar was stuffed full of trout, and every trout was cold and stiff as a wedge. Of course, the fish had been kept quite dry, which is a most desirable thing. If a trout is soaked in ice water it will get soft as a sardine soaked in oil. The old way of packing trout in damp moss is a good one, for evaporation keeps them cool. Mr. Dudley, of Dudley P. O., Wis., nearly always packs the trout for his guests in cotton batting before he puts them on ice. I have seen nothing better for carrying trout than the refrigerator basket used by the members of the Pere Marquette Club, of Michigan. I should think that if the trout were placed in jars in one of these baskets they would keep just as well, and perhaps be dryer. The basket in question has a nice chamber, but the latter is open at the top. I wonder how it would do, if a fellow had to make his own refrigerator basket, to take two or three big fruit jars, fill them with ice, and screw the caps down. These could be placed in a pail, and ought to set up quite an ice cellar of their own, in which the fish could be kept cold and dry.

Wausaukee Club.

There will be an informal opening of the Wausaukee club house in Wisconsin on Sunday, May 14, at which time a number of Chicago gentlemen will go up to try the fishing. The greatest spring celebration of this worthy club, however, will be on May 30, which will be a highly enjoyable day, with many ladies in attendance and a full showing of the club membership. This club comes as near to being a trout club as any we have in Chicago, though it is in good bass and deer country also. A full account of the opening of this club house at the beginning of the club membership. This club comes as the time, some years ago.

Where to Go.

Mr. Gilbert L. Watson, of Parkersburg, W. Va., writes me as below under date of May 9: "Your letter in the FOREST AND STREAM of February in relation to the use of flies in fishing in Michigan streams has been read with interest. Will you kindly inform me of the most favorable stream for trout fishing in Michigan, and also the proper time of the year for the best convenience and success."

Perhaps Mr. Watson will find something of interest above in these columns. I would suggest that he try the Pere Marquette River, where he will get both brook and rainbow trout and stand a very good chance of striking a big rainbow. They tell me that the best time to get these biggest rainbows is in August, when the fish are feeding on grasshoppers. If Mr. Watson will go to Grand Rapids and inquire at the local gun stores he can get the information he will further need. Should he happen to meet Col. E. Crofton Fox, Mr. John Waddell or Mr. Harry Widdicombe he might be fortunate enough to secure advice which would be very useful to him.

A New Tarpon Club.

Mr. A. W. Adams, who spent the winter at San Antonio, Tex., tells me that the club house of the Tarpon Fishing Club, at Aransas Pass, is in full operation and re-

ceiving much patronage from its members. More than this, he says that there is in process of organization another big club, which will be put up on the mainland at the quaint old village of Rockport. Mr. Green, president of the Tarpon Club, was asked to accept a similar office for the new organization, but declined, stating that it would be better to have a different executive, so that a friendly rivalry might spring up in the way of yacht races, etc. It seems now certain that this sleepy and delightful corner of the world is to be invaded by the throngs of fashion. We are going to Florida-ize Texas. It is a long way to the tarpon keys of Rockport coast, but the trip is worth the making. That the new club will be a success hardly admits of doubt.

In passing, and while speaking of San Antonio, I may say that Dick Merrill also wintered there, and was at last accounts home in Milwaukee. He probably has trout in his eye by this time. Joe George, who was postmaster, will probably not spend the summer at San Antonio. Mr. George made a recent trip to Monterey, Mexico, to take a rest and look around. Capt. Oscar Guessaz is now home from Cuba, and being disappointed in his ambition to join the troops in the Philippines, will probably remain at San Antonio for a time, unless those quail over in Cuba prove too strong for him.

The Rockport Tarpon Club.

May 13.—Mr. A. W. Adams, of this city, who has spent the winter, as is his custom, at the pleasant Southern city of San Antonio, Tex., was often at the Gulf Coast at Rockport and other points, and he is so kind as to give me for the FOREST AND STREAM the following details regarding the latest club to go into that favored region:

"A tarpon club, for the purpose of fishing and hunting, has recently been organized, with a membership of 400, and the following board of directors: Mr. J. C. Van Blarcom, St. Louis, Mo.; Mr. A. W. Houston and Mr. J. S. Lockwood, San Antonio, Tex.; Mr. W. C. Connor, Dallas, Tex., and Mr. E. H. R. Green, Terrell, Tex. The object of the organization is fishing and hunting, to which end a handsome steam yacht has been purchased and the erection of a beautiful club house begun at St. Joseph's Island, Aransas county, Tex.

"For fishing and hunting a better place could not have been found. Here in early winter are canvas-back, red-heads, mallard, blue-winged and green-winged teal, pintails, widgeon and other varieties of ducks. There are also wild geese of all kinds. The Tarpon Club house is to be situated in the very center of this sportsmen's country, abundant reservation having been secured for use of the members of the club, and will be kept open and in operation the year round, for every day in the year the locality furnishes sufficient amusement in either hunting or fishing. As a game fish the tarpon has no equal. Aransas Pass is its feeding ground. Tarpon fishing commences about April 1 and lasts until about Dec. 1, when the cool weather drives them into deep water, and duck shooting about Oct. 1, and lasts until April 1. Aside from tarpon there is an abundance of Spanish mackerel, pompano, bluefish, sawfish, flounders, sheepshead, croakers and other varieties. About a quarter of a mile from the club house the surf bathing in the waters of the Gulf of Mexico is excellent. The water has a temperature of about 70-degrees all the year round. The inner bays furnish unexcelled opportunities for yachting.

"The club building is to be two stories high, is shaped like the letter L reversed, and is 176ft. long on the stem of the L by 154ft. 6in. on the base line. On the first floor will be the office and billiard room, private office, a buffet, dining room and dancing hall, private dining room and kitchen. The private office will be fitted with lockers for the storage of fishing tackle, signal flags, etc.

"One of the features of the first floor is a large open veranda, especially arranged for the accommodation of hammocks.

"The second floor is to contain eighteen sleeping rooms for both ladies and gentlemen, a store room, linen room and two servants' bedrooms. Each sleeping room has two outside doors and two windows, and nine of the rooms are en suite. The parlor is on the corner of the building, and will be fitted up with especial view of making ladies comfortable. Around all sides of the building both up and down stairs is a veranda. From the first floor veranda steps lead to the ground, and five stairways from the veranda lead to the second floor.

"The interior of the building will be finished with matched and beaded wainscoting. The latter will receive an oil finish on the first floor and be painted on the second floor.

"From the second floor balcony a stairway leads to the tower, around which runs a balcony at a height of 60ft. above the ground. In this tower will be placed a powerful searchlight.

"The building will be lighted by electricity and electric lights will be placed not only in the rooms, but on all verandas. The power for the illumination will be obtained from an electric plant located in a separate building containing dynamos run by a naphtha engine, which will also be used in pumping water from a 26,000 gallon cistern to a tank of similar size 30ft. high. From the latter the water will be piped to the house.

"The building will be constructed entirely of wood, to rest on piling driven into the ground by hydraulic pressure. The first and second stories will be finished on the outside with pine siding, and the tower and gables will be shingled. The main body of the house will be painted white, the cornice and windows green, and the roof red. Some idea of the size of the building can be gained from the fact that between 400,000 and 500,000ft. of lumber will be used in its construction. The lumber, when placed in the building, will cover 12,094 sq. ft. of ground, upon which it is erected. The total floor area, including the tower, is 24,477ft.

"The electric light plant will furnish illumination for 126 incandescent lamps, each 32-candle power, and also for the large searchlight."

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Minnesota Fish and Game.

Editor Forest and Stream:

Mr. John Bentner, executive agent of the Minnesota Fish and Game Commission, accompanied by Supt. Morgan of the State Hatchery, have just returned from Vermillion Lake, where they had been to get the usual supply of pike spawn for hatching at the State Hatchery. The trip was not an unqualified success. On former occasions no trouble has been experienced in getting a sufficient supply for all demands, but owing to unusually high water, no fish were found on their usual spawning grounds, but were found on some rapids further down the stream. The swift current made the use of nets almost impossible. As a result, about 1,000,000 spawn were obtained. It was the intention of the commission to get not less than 100,000,000 spawn.

I see by a Duluth paper that some sportsmen are inclined to criticize Mr. Bentner for the failure of the expedition. In this connection it should be remembered that Mr. Morgan, of the State Hatchery, was on the ground and attributes the failure to the reason given above.

It may be further stated that Supt. Morgan has warned former commissions that what has happened this spring was likely to happen at any time, and has recommended the blasting out of the rocks in this particular place, so that nets could be used if the pike should ever use this place as a spawning ground.

For some years many thousand dozen goose and duck eggs have been taken from the breeding grounds of these waterfowl, particularly in Kittson county. Last year the quantity shipped was enormous. The albuminous part of the egg is used in the manufacture of photographers' materials. The yolk is also utilized, but in what way I could not learn.

Mr. Bentner informs me that he has stationed men at various counties, and will endeavor to prevent the despoiling of the nests.

A determined effort will be made to protect moose and deer from indiscriminate slaughter in certain parts of northern Minnesota. There is the best of reasons for saying that lumberjacks have been feasted on moose and venison steaks by their employers, who engage a man for the purpose of securing the supply for the camp. The killing has not been confined to the winter season only, but the flesh of these game animals is frequently found on the tables of hotels during the summer season.

The family who comes from an Eastern State each summer and shoots moose at night by torching, should receive especial attention. I am credibly informed that three moose were killed in one night last season by this family. Parts of the carcass are smoked and taken home for family use. There are twelve salaried game wardens in this State. It is the intention of the commission to put the entire force of paid men into the northern part of the State when the season for shooting game birds opens, and they are not needed in their respective localities.

J. W. G.

A Trout Quartette.

DURING one of those occasional lulls that occur even in a busy law office, my mind lately reverted to a happy day away back in 1894, when I made my championship catch of trout in a small stream at Ticonderoga. It was along toward the end of the season that I happened to cross this cold brook on my way from a pond where I had been catching bass. No one had fished there for a good many years, and a youngster on his way home with the cows inquired, "Say, mister, be you a-fishin' for chubbs?" as he saw me getting the line ready. Well, the boy passed along, shying small stones at his cattle, and I baited up with an angle worm and threw in just below an old bridge where there was a large stump. The line had scarcely touched water when with a loud splash something appeared from the deep pool, and crouching behind a low bush, I saw a mouth and a pair of shoulders that fairly made even my veteran heart leap to my throat. But, alas, the mighty trout missed his aim, or perhaps it was his last bit of sundown exercise for the day. Anyway, back he went to his home among the dark roots in the sweet, cold water. No lure in my collection could draw him forth, and I sadly returned to the old log farmhouse at "The Vineyard," where I always spend my summers.

I could not forget those big jaws and shoulders, so, as soon as I could escape from farm work, I repaired to the brook once more, determined to get the old fellow and his mate, if possible. It was a bright, sunshiny day, the last of the trout season, as I remember, and there was a slight western breeze. I had a \$1.50 three-jointed pole with a cheap reel, and used a large, old-fashioned, English-made fly that I had recently bought on a bargain counter in New York.

A large insect attracted my attention just then. I captured it, and following a mere caprice, as anglers often do, ran the hook crosswise through its back. I then fell to laughing at my ridiculous double bait, as the natives called such contrivances. The fly was made of coarse feathers, brown in color, and resembled nothing on earth or in the sky that I had ever seen. Then the insect capped the climax. I am not going to tell the readers of the FOREST AND STREAM the name of the live part of this bait, for fear of possible future rivals. But to proceed with my story.

I dropped in just above the home of the big fellow, thinking that he had perhaps gone up to see his friends in the horse pasture. As the bait rested on the surface, something slowly arose with its head down stream and then quietly sank to the bottom. I was almost sure that a large pike had run up from the pond to feed, although I had never seen one in such cold water. The fish actually seemed nearly as wide as the brook as he came into view. Some way, I am always the coolest with my big fish, although often nervous with small ones. I lifted the point of the rod, and to my intense delight the line was fast to a log—or something about as solid. I waited for about two seconds and then with a twist of the wrist set the old hook home. The little channel was only about 3 ft. wide and about 4 deep, but luckily there were no roots, so I played my game gently back and forth, keeping well out of sight, so as not to alarm him. Once he got ugly and made a rush for an old snag, but I forced him back to his bed without much trouble. He was now

pretty well tired out, but still full of mute protest. I then adopted a novel procedure. Laying the rod flat on the low bank, I began to play the fish, holding the line in my hands, as we often do when out alone on Lake Champlain trolling for big pike. I soon had his highness cornered up, and with the aid of my old gray fedora hat, treasured to this very day, neatly netted the prize, and he lay upon the grass, the largest wild brook trout that I have ever seen alive. He was beautifully marked, very stockily built and in splendid condition. The weight I could not ascertain, as I invariably dress my fish as soon as caught, to preserve the flavor; but I judged it to be at least 2½ lbs. His length was exactly 16 in.—"one foot four." Carefully putting him, or rather coiling him, into the basket, I worked a little further down stream and soon had his mate, a beauty of 15 in., using the same bait and fly, and landing her neatly with the rod. I kept on for about ten minutes longer, when I stopped, said good enough, and started for home. I had added in that time two more fish to my catch, measuring 12 and 9 in. respectively.

There was a jolly trout supper at the old place that night, and 7 or 8 lbs. of fish were used for the first course. There are several present readers of the FOREST AND STREAM who enjoyed my champion catch. I am still looking for the man who can beat that "old he one."

PETER FLINT.

150 NASSAU STREET, New York.

The Bullhead as a Standby.

A RHODE ISLAND correspondent, whose report is of white perch fishing that turned out to be bullhead catching, writes with true Waltonian philosophy of the satisfaction to be found even in the humble fields of angling. "We hired a leaky boat," he says, "rowed out to the spot that was pointed out as a likely place for white perch, and fished faithfully, but took only a few yellow perch. Then it was up with the sash weights that served as anchor to try another place, and so on all over the pond; but not a single white perch came our way. On our last anchorage I caught a bullhead, and then we both fished for them, catching them pretty, fast, some of the heavy ones making a good fight on our light rods. We fished until long after the stars came out, and the new moon hung low in the west.

"I like to read of the capture of tuna, tarpon, striped bass and other heavy game fish; and I have spent a good many hours casting menhaden bait into the surf for bass and catching flounders, skates and sea eels, with the bass few and far between. When once a good bass is hooked it is grand sport, but I think I would rather fish for lighter fish with finer tackle.

"I would rather catch trout than white perch, and perch in preference to bullheads; but there is a certain satisfaction in sitting in a boat on a summer evening and watching the daylight fade, and listening to the distant sounds, softened by coming across the water. Over on the side hill the 'whip-poor-will' whistles, and overhead four or five night herons pass with their hoarse 'qua,' and somewhere in the edge of the pond an old bullfrog tells us to 'sink deep,' 'sink deep,' as we do, and have lots of fun bringing up bullheads of a pound weight, about as fast as we can handle them. The bullhead is a reliable standby, and as one writer says, when once hold of the hook never tries to shake a friend, but submits to the inevitable. I would advise all who have not done so, to read Nesmuk's strong defense of the bullhead, and the catfish family."

"S. S. B."

New Hampshire Fishing.

NEWFOUND LAKE, Bristol, N. H., May 8.—The fishing season opened Tuesday, May 2, a number of salmon being caught at the Hebron end of the lake, a good catch of seven being credited to Chas. Fox and party of Hill, N. H. S. L. Sawtell, of Lowell, had fair luck, as did T. J. McDonald and wife, of Lowell. A Boston lady caught two salmon before breakfast Saturday morning. On the bar at the mouth of Fowler's River, Chas. A. Gale took a 7 lb. salmon Friday. At the foot of the lake in Bristol a 10½ lb. salmon was landed by Amasa Highlands, it being the largest taken thus far.

The trout are making reels turn merrily, such as, to Paul Lang, five in one day, total weight 56 lbs.; a 12½ and 10½-pounder, caught by Ed. Towns, of Bristol; also Dr. Ballou, 10½ lbs.; Chas. Rounds, two trout; Ansel Doloff, one; Fred Falls, two. Perhaps a dozen others whose names we did not get. We hope to fight it on this "line" if it happens all summer.

LANDLOCKED SALMON HOUSE.

The Connecticut Fish Commission.

THE Governor has done a most discreditable and strange thing in refusing to reappoint Mr. A. C. Collins, of Hartford, as Fish and Game Commissioner. Mr. Collins has been for several years on the commission, but before that, as agent of a State Protective Association, won wide reputation for the skill, activity, dauntless courage with which he enforced the fish and game laws. Evil doers learned to dread him, and, incidentally, he got to know the State like a book for the purpose of fish and game protection. All that knowledge he brought to the position of commissioner, and superadded wisdom of fishculture, sequels of which were the decided increase of our shad supply, the substitution of trout fingerlings for fry, and the intelligent information conveyed constantly to legislative committees in relation to fish and game statutes. The "turning down" of such a man is a capital misfortune to the sporting interest of the State, and is as foolish as it is incomprehensible.—New York World, May 7.

Quebec Salmon Netting.

Editor Forest and Stream:

Recently a committee of two from the Sainte Marguerite Salmon Club had a conference at Quebec with Mr. Parent, Commissioner of Lands, Forests, and Fisheries for the Province of Quebec, concerning the illegal netting that has been going on for the last two years on the Saguenay River.

Mr. Parent met us cordially, and seemed very much in earnest in his wish that the practice should be

stopped at once. He agreed to pay one man, we to pay his companion, to patrol the Saguenay from Tadousac to the mouth of the Ste. Marguerite, a distance of eighteen miles, during the months of June, July and August, and we shall put on two men in addition.

By the new fish and game laws, passed last winter by the Provincial Parliament, these guardians are given large powers; for, in addition to being guardian and constables, they are made magistrates, with the powers of justices of peace, as far as all fish and game matters go. So now it looks as though a stop would be put to the work of the poaching gangs on the Saguenay.

We have found that the local justices of the peace here sympathized too much with the poachers, for in 1896 we had men out who lodged information against fourteen men they had seen taking salmon illegally, and they were all arrested, but their cases were continued until March, 1897, and then the justice discharged twelve and fined the other two—one \$2 and the other \$5—which, of course, only encouraged the law-breakers to keep on with the poaching.

Last autumn Mr. Parent sent down one of the higher judges to try thirty-one men, against whom Mr. A. J. Price had laid information, and they were all convicted and imprisoned, good evidence of the earnestness of the Government in this matter.

Mr. Parent said he was very glad we had come to see him, and he wished that representatives of other clubs would come to him and talk over any troubles they have on their waters. It would certainly be a good thing if the members of fishing clubs, on their way to their rivers, would remain over in Quebec a day to call upon the Commissioner, for it will strengthen his hands to feel that all the anglers recognize what he is doing and wish to help along the great work he has undertaken. He seems determined to stop illegal netting.

GARD. T. LYON.

On the New Jersey Shore.

ASBURY PARK, N. J., May 9.—Striped bass are moving along the coast and taking the hook at least a month earlier than last year. At Manasquan Inlet the catches for the past ten days have been fully equal to what is ordinarily to be expected in June. To take five and seven to the rod in a single day is no unusual occurrence. While they are not as yet of the large size, still they are most welcome visitors and receive most marked attention. The largest one so far was taken to-day, 13 lbs. Kingfish, too, have put in appearance, and share honors pretty evenly with the bass; they, too, are unusually early; while I have known them to be on thus early in former years, still, last year May 30 was the date of the first catch from the beach here. The weakfish too are about, as they are being taken pretty freely in the pounds, and they should be ready for the hook in the surf within the next month. I saw large schools of butter fish in Shark River last Sunday, doubtless driven in by the weakfish, which feed on them most voraciously. A few bluefish have been taken in the pound at Elberon, and that is a remarkable fact, as they usually do not approach the shore thus early in the season. The indications are that, weather conditions remaining favorable, we should be enjoying good fishing by June 1 and that is as early as we ever anticipate. We now have what long has been a dire necessity, viz., a first-class rod factory. To numberless anglers this will prove a positive boon, as heretofore all repairs had to be sent to the cities, involving tedious delays and heavy expense.

LEONARD HULIT.

Chicago Fly-Casting Club.

CHICAGO, May 13.—Editor Forest and Stream: The scores of the meet to-day were as follows:

	Long Distance Fly, Feet.	Distance and Accuracy, Per Cent.	Accuracy and Delicacy, Per Cent.	Bait Casting, Per Cent.
J. D. Belasco.....	95	69 2-3		89 1-15
J. H. Bellows.....	116	90 1-3	94 1-3	93 7-15
C. H. Chadwick..		70 1-3		90 2-15
H. Greenwood ..				93 2-5
H. G. Hascal.....	105	81		95 13-15
E. R. Letterman..		71 2-3		89 1-3
F. N. Peet.....	118	89 1-3	93 1-6	96 2-15
H. W. Perce.....				83 11-15
E. A. Renwick.....	101	78	92 5-6	87 7-15
G. W. Salter.....		86 2-3	87 1-3	83 13-15

Holders of Medals.—Long distance fly, F. N. Peet; distance and accuracy, T. H. Bellows; accuracy and delicacy, T. H. Bellows; bait-casting, F. N. Peet.

The Kennel.

National Fox-Hunters' Association.

THE Foxhound Stud Book, published by authority of the National Foxhunters' Association, appears in a most artistic dress in its first volume, for 1898. It is compiled by Col. Roger D. Williams, keeper of the Stud Book. It contains a list of the officers of the association, its constitution and by-laws, code of running rules and regulations, a list of the hunt clubs in the United States, with their officers, records of all foxhound trials, standard for judging, and pages from 13 to 83 are devoted to registrations and listings. It contains portraits of Rear-Admiral James E. Jouett, U. S. Navy; Col. Haiden C. Trigg (Full Cry), of Kentucky; Dr. Wash-Miller, of Kentucky; Dr. W. F. Sturgill, of West Virginia; A. B. F. Kinney, of Massachusetts; W. S. Walker, of Kentucky; Geo. L. F. Birdsong, of Georgia; Gen'l G. W. Maupin, of Kentucky; Col. Theodore Roosevelt, of New York; W. W. Huffstetter, of Kentucky; Foxhall Keene, of New York; Col. Roger D. Williams, of Kentucky; Dr. A. C. Heflinger, of New Hampshire; W. N. Ramsey, of Kentucky; Dr. James F. Rosborough, of Texas; J. C. Varner, of Arkansas; T. H. Brown, of Texas; Carey Randolph Ruffin, of Virginia; R. E. Lee, Alabama; J. H. Wallace, Jr., of Alabama; George J. Garrett, of Georgia, and R. M. Smith, of Mississippi, all famous in the annals of fox hunting. To Col. Williams great praise is due for compiling and editing a work which so greatly redounds to the credit of the Association.

Yachting.

The Canada Cup.

FROM what is now known of the different contestants in the series of trial and final races for the Canada cup, it is evident that these races will be one of the features of the season, second only to those for the America Cup. While they cannot compare with the latter as a personal duel between two of the greatest of modern designers backed by unlimited money, producing the fastest and most costly craft ever floated, at the same time the series of races promises to rival the great class contests of the 40-footers in 1888-9, the 46-footers in 1891-2, and the 21-footers in 1892. As in all of these, the interest in the 35ft class will be due to the number of contestants, the variety of types, the personality of such designers as Messrs. Duggan, Payne and Hanley, and the number of races to be sailed. In addition, the contest is in every sense an international one, Canada being pitted fairly against the United States; and the result can hardly fail to determine the fate of the Y. R. A. girth rule, as applied to American conditions.

While it is hardly safe to say that no boat building for the class is as yet unknown, and that none may yet be started, it is pretty well settled that the class will be limited to ten yachts, four for the challenge and six for the defense. Of the former, three are of the keel type and one a centerboarder. This latter, Genesee, has already been described; she was designed and built by C. C. Hanley, of Quincy, Mass., formerly of Cape Cod, for the Rochester Y. C. syndicate. Mr. Hanley has been remarkably successful for some years in the Cape cat type and its modern development into the wide but fairly deep centerboard sloop, such as Acushla; his work, however, has been confined exclusively to salt water, mainly Buzzard's Bay and Massachusetts Bay, and to some form of simple length rule with unlimited sail. In this case he is working under new conditions, for lake sailing; and under an entirely new rule, the outcome of which no one is yet able to predict. There is little doubt that he has turned out a very fast boat of the type; the question being whether this type is suited to the girth rule and the local conditions on Lake Michigan and Lake Ontario.

The Cuthbert boat, designed for the Peare syndicate, Vera by name, has been very closely guarded, being built under lock and key, and as yet little is known of her except that she is of the modern keel or semi-fin keel type.

The third boat, Josephine, is described as follows by the Hamilton Times:

Mr. Geo. Webster, the well-known yachtsman, has returned from a visit to Chicago, where he assisted in trials of the yacht Josephine, the Whitely-Griffith challenger for the Canada cup. The boat, which was designed by Mr. Webster, was built at Muncie, Ind., and taken by rail 200 miles, to Chicago. The owners, Bert H. Whitely, of Muncie, and D. D. Griffith, of Chicago, accompanied by Mr. Webster and Capt. Burrell, formerly skipper of Zelma, sailed the new yacht under the old Pathfinder's jib and topsail, to South Chicago, where the new challenger received her sail rig. These sails were something of a surprise to the Chicago yachtsmen, in that they are from Ratney & Laphorne, the celebrated sailmakers of Cowes, Isle of Wight. Mr. Webster had two spins out on the lake in the new boat, and he says she skipped along in fine style especially in the heavy weather encountered while out on Friday last.

The boat is of white pine, with trimmings of mahogany, and the interior workmanship, Mr. Webster says, is the finest he has ever seen. So well were the details of construction carried out in the Muncie workshop that not a change of any kind had to be made in the original plans after the boat reached the water. Her dimensions are 47ft. on deck, 27ft. on waterline, 10 ft. 6in. beam, and 6ft. 2in. draft. "Most of the overhang is at the stern," remarked Mr. Webster to-day, in discussing the boat, "and she is not in any way a freak. She carries about five tons of lead on her keel. Her cabin skylights are flush with the deck, and all the interior fittings are made to clear to a racing hull in a few minutes, and with little or no trouble."

Captain Burrell has been engaged to sail the boat this summer. He will move his family from here to Muncie in a few days. "With a Canadian designer, a Canadian skipper and English sail," remarked Mr. Webster, with a laugh, "there won't be much Yankee about the boat."

Another dispatch from Chicago says:

The new yacht Josephine, another of the Chicago Y. C. contestants for the honor of competing for the Canada cup race, arrived off the harbor Tuesday noon from South Chicago. This is the \$7,000 yacht built at Muncie, Ind., by the Whitely Steel Company for Burt H. Whitely and D. D. Griffiths. She is a pretty little yacht, 47ft. over all, 10½ft. beam and 26ft. on the waterline. She will carry about 1,500 sq. ft. of sail, and has a modified bulb keel. She will carry a crew of six in the races, but for cruising has quarters for twelve. Workmen were busy Saturday bending on the sails and putting the finishing touches upon her in preparation for trials to-day.

Mr. Webster is a well-known Canadian yachtsman, of Hamilton, Ontario, where he has built several yachts of his own design, afterward sailing them with good success in the L. Y. R. A. circuits. The most notable of these was Eva, a keel boat in the 32ft., now 35ft. class, finally sold to Lake Erie. The nationality of this new yacht is a little doubtful, she was built, in an inland town in Indiana, by a Hamilton builder, and though as a professional he cannot steer her in the races, her skipper is also a Canadian from Hamilton. The sails, it is needless to say, came from Cowes, or Gosport, England.

The fourth yacht has been built during the winter by the Spalding St. Lawrence Boat Co. at its shops at Ogdensburg, N. Y., and though there have been no locked doors and soaped windows, very little has been known about her. Her owners are Com. F. W. Morgan, Chicago Y. C.; Chas. H. Thorne and William Herrick. She was designed by W. P. Stephens, and in type she is a keel cutter, such as has thus far proved the most suc-

cessful on the Great Lakes. The name selected by her owners is Prairie, a new one on the yacht list, and at least indicative of her Western ownership and origin. She is 44ft. over all, 28ft. l.w.l., 9ft. beam and 7ft. draft, with an S section, well hollowed below, and a bulb keel. She was designed especially to fit the new girth rule and the somewhat conflicting conditions of Lake Michigan and Lake Ontario. With a rather full load waterline, she has no freak features. She has been designed to fit the rule rather than to evade it. The scantling throughout is up to the limit of the tables, and the possibility of a voyage of from 1,200 to 2,000 miles through the Lakes as a part of this season's racing has called for special care in her construction.

While she has been designed solely for the Canada cup races, this type of hull furnishes very fair room below, and with her mahogany cabin house in place she will have over 5ft. head room and good accommodation below for cruising. In racing she will carry two light flat hatches, and for the present she has no internal fittings but a light seat on each side of the cabin. The deck is flush, with a small racing cockpit, and she steers with a tiller, the rudder being hung on the sternpost. Her overhangs are moderate, about 6ft. forward and 9ft. aft, but they are used to finish out the bow and buttock lines. The topsides are planked with white pine in narrow widths, the bottom is planked with white cedar, with oak garboards, and the deck is of clear pine, with marine glue in the seams.

She will carry about 1,500 sq. ft. in the cutter rig with pole mast, her boom being 36ft. The sails are by Wilson & Silsby, Boston, of the newest materials. The hull is enameled white above water, with a gold stripe. Her builders have turned out a very handsome piece of work, and one that will last for many years.

The following comments are credited to a Chicago yachtsman:

It is rather a coincidence that the Chicago boats which were built for the Canada cup race closely resemble each other. When the boats were building the owners guarded the secrets of their construction closely, and one could find out nothing about them. It so happens that the plans were made public at about the same time, and the figures show that the three boats are as nearly alike in construction, and in other details, as if the same designer had built all of them. The three boats are really miniatures of Defender. Of course there was no copying, for such a thing would be impossible, so close-mouthed were all the people involved.

The Chicago boats are of the cutter type. You will find that, averaging them up, they will show about the same figures. Four tons of lead on the keel, while 45ft. over all will fit each one. A 9ft. beam and a 25ft. waterline are other points which are noticeable. All draw about 7ft., although Josephine has a 6½ft. draft. They will carry from 1,500 to 1,650ft. of canvas. Peare's boat being built for the 1,650ft.

Both in the number of yachts and in the variety of types, the defense is stronger than the challenging side, as the six boats include one centerboard, two keels and three fin keels. The centerboard boat was designed by G. H. Duggan for the syndicate headed by George P. Reid, of the Royal Canadian Y. C., and she will be sailed by J. Wilton Morse. She is now under construction at the shops of Harry F. Hodson, Toronto, builder of Glencairn I. She has been very closely guarded, and even now, when nearly ready for launching, is still under lock and key. The general belief about Toronto has been that she would prove a fin keel, but it is now known that she is a centerboard boat, with outside lead. Mr. Duggan is a strong opponent of the girth rule, and the probabilities are that if there is a weak place in this rule, designed nominally to produce a wholesome and usable type of yacht, he will find it. The spars are being made by the Yacht Company, at Dorval, under Mr. Duggan's personal supervision, the rigging will be made up there also, and the ironwork is being made at the shops of the Dominion Bridge Company. No name has yet been chosen for the yacht. It is expected that she will be ready for a trial sail by the first week in June, and for the race of June 12 for this class.

In addition to the Reid syndicate, organized at the outset early last winter, two others have lately been organized by Æmilus Jarvis, who managed and sailed Canada in the first races for the cup in 1896. The boats are building at Oakville, Ontario, a few miles west of Toronto, by Andrews, the builder of Canada. The first, now partly planked, is from the designs of H. C. McLeod, of Halifax, N. S., and formerly for a time a resident of Minneapolis and Chicago. Mr. McLeod, who holds a prominent position with the Bank of Nova Scotia, has followed yacht designing as an amateur pursuit for many years, and has turned out some fast racing yachts, both of the keel type and the modern shoal skimmer and scow types. His new boat is a beautifully modelled cutter, with fine S section, about 44ft. over all, 30ft. l.w.l., 9ft. beam and 6ft. draft, carrying 1,400 sq. ft. of sail.

The second boat will be started this week, if the designs arrive, as expected, from England. Arthur E. Payne, of the firm of Summers & Payne, Southampton, Eng., is well known to our readers through his many successful yachts, Decima, Corsair, Penitent and others. The new boat will probably be similar to his 36-footer, Emerald, reduced 1ft. in measurement, and, of course, shortened on the waterline. Mr. Payne has thus far had no experience in designing for American conditions, nor has he visited this country, but it is more than likely that he will be guided in the selection of the elements of the design by Mr. Jarvis; at least, in so far as the length and sail area that experience has shown to be best adapted to the lake in summer. As far as lines and construction go, he is likely to turn out a fast and handsome yacht. Mr. H. K. Wickstead, of Cobourg, will superintend the construction of both of these boats, when they are ready Mr. Jarvis will sail one of them, and the other will be handled by some good Corinthian. It will be well toward the end of June before they can be out.

The three Hamilton boats already mentioned, are nearly ready for the water, and will be sailing in a short time. Hamilton boasts a number of clever men, both at the stick and about the deck, and all three are likely to be well handled. It is impossible to forecast their chances of success without knowing more about them, but

between the three, the fin type will probably be well represented.

All of the yachts, on both sides, are being built under the table of scantling prepared for the Yachting Racing Union of the Great Lakes by Mr. Stephens in 1897, but not yet tested to any extent. With the exception of the design from Mr. Payne and of sail cloth and imported Scotch wire, the Canadians have relied solely on themselves for the defense of the cup, the designers and builders are all native Canadians, and such fittings as cannot be had in Canada, blocks, and similar gear, are being specially made, instead of being imported from the United States. The sails will probably all be made in Canada, though from the very limited demand for costly racing sails, the sailmakers are thus far by no means equal to those of the States.

The whole policy in this respect is an admirable one, it is inevitable that, while united so far as associations and rules go, the yachtsmen of Canada and the States must always be friendly rivals in such contests as the Canada cup, Seawanhaka cup, etc. Thus far Canada has been at a serious disadvantage in the lack of designers, builders, sailmakers, and of such an extensive market as the States afford for the purchase of all the minor accessories of yachting. Within the four years since the Royal St. Lawrence Y. C. first challenged for the Seawanhaka cup a great stride has been made, Mr. Duggan has come forward as a designer of the highest rank in the smaller classes, and others have come in with less conspicuous success; some of the finest blocks and fittings yet seen on small craft have been made in Montreal, many ingenious devices in construction have been introduced, yacht cordage of the finest quality has been put on the market by Canadian makers, and material advances have been made in the art of sailmaking. As matters now are, Canada is rapidly removing the serious handicap under which she thus far labored as opposed to a larger nation in which yachting has long had a strong popular support.

Until all the yachts have been tried under sail it is impossible to form any conclusions as to the probable winners of the trials and final races, but thus far the advantages are manifestly, as in most international races, on the side of the defender. The six Canadian yachts need only to be designed for the trial and final races at home, Hamilton being within thirty-odd miles of Toronto. Nothing more need be expected of them than speed under normal racing conditions on Lake Ontario. After being once afloat, they can be sailed day after day for nearly two months before the final races.

On the part of the challenger, the yachts must be designed, to a certain extent, to meet the conditions on Lake Michigan, stronger winds, rougher water, and probably much harder weather even in summer than on Lake Ontario. It is by no means a certain thing that the yacht which shows the best performance in the Chicago trial races early in July will be the best one for the races on Lake Ontario six weeks later. Apart from this, after the selection has been made, the challenger has a voyage of upward of a thousand miles, a matter of a couple of weeks' or more, with incidental delays, to say nothing of possible damage to the light racing gear and canvas. Two of the yachts have to reach Chicago by long voyages, Genesee having some 1,800 miles to traverse between Boston and Chicago, while the distance from Ogdensburg to Chicago is nearly 1,200 miles. All of these conditions materially favor the home boats from the start.

The dates of the races have already been published, Chicago trials July 4 and following days, Toronto trials, Aug. 7, cup races beginning Aug. 21. The Royal Canadian Y. C. has arranged to select a committee from all the Canadian yacht clubs to make the choice of a defender in the trial races. Invitations have already been sent out to one member from each of the clubs, Royal Nova Scotia, Royal St. Lawrence, Quebec, Kingston, Royal Hamilton, Queen City and Victoria, and the committee will be completed by several members of the Royal Canadian. In this way it is hoped to reach a satisfactory and fair decision as to the best yacht to defend the cup.

Royal St. Lawrence Y. C.

THE Royal St. Lawrence Y. C. is looking forward to a season of lively racing, though there is perhaps less of a general interest in the extreme racing boats than at any time since the challenge for the Seawanhaka cup in 1895. It is true that there will be two instead of one series of foreign matches this year, and these will be hotly contested, but by a small number of boats. A great deal of interest is already awakened in the match between the White Bear representative, Yankee, and the famous 20-footer Dominion, winner of last year's races. The champion will be sailed precisely as last year, steered by Mr. Duggan and manned by the same crew, her rig being unchanged. She is now in the big shed at Dorval, bottom (or rather, bottoms) up, for a good polishing after a fresh coat of white enamel. Her seams and planking show no signs of the hard weather of the last season's races. Beside her in the shed are her sister boats, Strathcona and Speculator, both ready for racing except for the varnishing and polishing. The trials of last year showed the pair to be about equal to Glencairn II., at least, and they are quite available this season. In the shop is a new racing 20-footer, of the same type, but showing the effect of the over-all limit and the limit of angle of bow. Dominion is of course barred from the Seawanhaka races by her over-all length and square bow; the other three, Speculator, Strathcona and the new boat, as yet unnamed, show very little difference in excellence of model. It is probable that only these three boats will be in the trial races on July 17, and the following days; nothing is known yet as to outside boats, and there will probably be none. In this case Mr. Duggan, with his crew, will take the best of the three, probably the new one. Though four boats are mentioned for the Seawanhaka trial races to select a challenger, but two are definitely known—Duchess, and the new Crowninshield boat for the Bridgeport syndicate, now building at Lawleys'. It is doubtful whether more than four start in the trials.

The new one-design class, illustrated in the FOREST AND STREAM of April 29, makes an excellent boat for waters in which draft is limited, as on many parts of Lake St. Louis. Five of these boats have been built by the Yacht Company at Dorval and are now ready for the

water. It is probable that the members of the club will devote themselves more than in the last few years to the racing in this and other small classes rather than to the 20-footers. The club has announced the following fixtures for the season:

May 13—Twenty-foot racing class, and 22ft. one, one design class.
 May 20—Twenty-foot racing and 22ft., one design class.
 May 24—Larks, 17ft. knockabouts, 20ft. racing (morning and afternoon).
 May 27—Seventeen-foot knockabouts, 20ft. racing and the cruising class.
 May 27—Seventeen-foot knockabout, and 20-footers.
 June 3—Twenty-footers, 22-footers, and general handicap.
 June 10—Seventeen-footers and 20-footers.
 June 12 and 16—Series of Dominion and White Bear races, for the Commodore Ross Cup.
 June 17—Larks, 20-footers and 22-footers.
 June 24—Seventeen-footers, 20-footers, 22-footers and the general handicap for the Donald A. Smith cup.
 July 1—Larks, 20-footers and 22-footers.
 July 8—Seventeen-foot class, and 20ft. class.
 July 15—Twenty-foot class and 22-footers.
 July 17 to 19—Seawanhaka trials.
 July 22—Seawanhaka trials.
 July 26 to 29—Races for the Seawanhaka cup.
 Aug. 5—Valois regatta.
 Aug. 12—Larks and 17-footers.
 Aug. 19—Hamilton cup day—17-footers, 20-footers and 22-footers.
 Aug. 26—Lake of Two Mountain's regatta.

The New Royal Yacht.

THE new yacht built for Queen Victoria was successfully launched on the afternoon of May 9, the Duchess of York officiating as sponsor. The yacht is described as follows by the London Telegraph:

"Heaven's Light Our Guide" is the motto of the new royal yacht. The introduction of the leek, the Welsh national emblem, beside the rose, thistle and shamrock, at the bows under the royal standard, illustrates the kindly sentiment of the royal family toward the principality. This royal recognition of the humble leek is quite an innovation, which will give pleasure to Welshmen all the world over. It is a delicate compliment to the country which has built all the royal yachts except the little *Elfin*. The present *Victoria* and *Albert*, the *Osborne* and the *Alberta* were all constructed at Pembroke Dockyard. On Tuesday the Duchess of York, by severing a cord, released the new *Victoria* and *Albert* from the slip, a beautifully carved ivory mallet having been made specially for the use of her Royal Highness, and as a memento of the occasion. The present *Victoria* and *Albert* has many sacred memories for the Queen. She was built and decorated under the personal supervision of the Prince Consort, whose piano, despite the lapse of years, still remains on board. The fittings and upholstery are practically the same to-day as when the vessel was new, and the memory of her Majesty's Consort will be perpetuated in the new yacht in many ways. The royal apartments, for instance, will be hung with chintz of the same design as that in the present yacht—moss rosebuds on a white ground. This simple design has never wearied the Queen.

The new yacht will not be the largest royal vessel in the world, but she will be by far the most palatial in all its appointments and decoration. She is 800 tons less in displacement than the *Russian Standart*, but has the advantage of nearly 600 tons over the German Emperor's new yacht, the *Hohenzollern*, the pioneer modern yacht of European monarchs. There is one great difference between these three yachts, however. While the *Standart* and the *Hohenzollern* are armed—in fact, are almost war cruisers in all but name—the new *Victoria* and *Albert* will be a pleasure vessel, first and last, and has been built with no thought of ever being required to fulfill any warlike purpose. Consequently provision has not been made for the mounting of any guns, except a few small pieces capable of returning a royal salute. She has been built to give pleasure and to fittingly carry the mistress of the seas on occasions of state and pleasure, and will be the handsomest modern ship afloat when she is finally completed.

The main dimensions of the new *Victoria* and *Albert* may be appropriately compared with the present yacht of the same name, and the comparison shows that there are few points of resemblance. The latter was built of wood in 1854—forty-five years ago—and is driven, like all the other royal yachts, by paddle wheels. She has two funnels, fore and aft, and three pole masts. Driven by paddle wheels at a speed that never exceeds about sixteen knots under the most favorable conditions, and having a broad beam of no less than 40ft. 4in., she has been famed as the most comfortable royal vessel in the world, and latterly as the most antiquated also. On the other hand, the new vessel is built of steel throughout, her hull being sheathed with wood and coppered like any ordinary cruiser, so that she will be able to go for long sea cruises without losing speed from accretions to the hull, or experiencing delays while being docked to have her hull cleaned. It is said that the Queen was for a long time unwilling to abandon the paddle-wheel system of propulsion, which insures so great comfort in traveling. However that may be, the new yacht will be fitted with two screws. Whereas, the old yacht has a speed of at most sixteen knots, the new vessel will steam at fully twenty knots. The latter will not be as free from vibration or as steady probably as the old ship, but every reasonable precaution has been taken to prevent the royal passengers from experiencing discomfort.

The new yacht, which is to cost, when completed, £353,414, is 380ft. in length, has a beam of 50ft., a draft of 18ft., and a displacement of 4,700 tons. Her speed is to be twenty knots, with 11,000 indicated horse-power. The normal coal capacity is to be 350 tons.

Sir William White, the director of naval construction, designed her and has devoted his highest skill to attain in her the maximum of comfort. Even to the question of coaling he has arranged the bunkers that they may be filled from the outside without disturbing by coal dust the royal family on board.

The royal pavilion will be 150ft. long, extending from the stern of the vessel, and fore and aft there will be two pairs of spiral staircases for ascending from the upper deck to the promenade deck, which will be high out of the water. From the upper deck to the main deck, again, there will be lifts to enable her Majesty and suite to reach their private apartments with the least fatigue and inconvenience. The accommodation of the new vessel is far more commodious than that of either of the present yachts, and will enable her to be used with comfort for longer cruises, such as the Duke and Duchess of York have long been credited with the intention of taking. One feature of the royal yacht is that all the woodwork fittings are of non-inflammable wood, so that should a fire unfortunately occur, the flames would have less chance of spreading rapidly.

The new *Victoria* and *Albert* will be the handsomest ship afloat, if carving, paint and elaborate, but tasteful, gilding can achieve this end. Time was when such a craft would have borne as figurehead a representation of the reigning sovereign; but instead there will be at the bows a large shield bearing the royal standard and surmounted by a crown, carved and gilded. On each side of this centerpiece will stretch a floral scroll, on which the rose, the thistle, the shamrock and the leek will be fittingly represented. From the point on each side where this scroll will terminate will stretch a double line of moulding representing cable-laid rope, the lines being fixed 5ft. apart. This moulding has been carved from mahogany, and will be richly gilded. It will extend on both sides of the yacht practically from stem to stern. At the stern there will be further ornamentation, including a representation of the royal arms, above which there will be a medallion. In the center of this medallion there will be a star, and around the margin will be traced the words, "Heaven's Light Our Guide." On the two sides there will be some further scroll work of oak leaves.

Y. R. A. of Massachusetts.

As the result of the continued discussion of the recently adopted rules of the Y. R. A. of Massachusetts, a special meeting of the Association was held on May 6 at the call of the owner of *Beatrice* and four other owners. The vote was five for the abolition of the new rules and thirteen for their retention, as follows: For abolition, *Annisquam*, *Dorchester*, *Jeffries*, *Quincy* and *Wellfleet*; against, *Boston*, *Cape Cod*, *Duxbury*, *East Gloucester*, *Lynn*, *Manchester*, *Hull*, *Massachusetts*, *Mosquito*, *Old Colony*, *Savin Hill*, *South Boston*, *Squantum* and *Winthrop*.

In commenting on the matter, the *Boston Globe* says:

The value of the sail, ballast, beam and other restrictions in the Y. R. A. cabin classes will now be put to the test of actual racing. The failure of the owners of old boats to secure any modification of the sail restrictions at the special meeting of the Association Friday evening settles the restrictions for the summer at least, but no one can say at present just what the result will be. Whether the season is a success or not in the cabin classes, the racing—or lack of it—should furnish a basis for any needed revision of the restrictions in the early fall, so that every one interested may be heard and a satisfactory basis reached.

YACHTING NEWS NOTES.

The name given by Mr. James Coates to his new schooner is *Gleniffer*, from the "Braes of Gleniffer," near Paisley, Mr. Coates' home.

Sultana, steam yacht, J. R. Drexel, arrived at New York on May 7 from Marseilles, France, by way of Bermuda, having been absent over a year. When war broke out last spring she was in the Mediterranean, before going to Southampton, and the danger of capture from Spanish ships, especially the converted yacht *Giralda*, said to have been purchased for the purpose of picking up American yachts, caused her to lay up at Marseilles.

The fourth regular meeting of the Seawanhaka C. Y. C. was held on May 9 at the town house. Mr. F. S. Hastings was elected to fill the vacancy caused by the resignation of the treasurer, R. C. Wetmore. The question of adhering to the rules of the Yacht Racing Association of Long Island Sound was discussed at some length, and it was finally decided to adopt all of the rules but that relating to measurement, retaining the old length and sail area rule. The club house at Oyster Bay will be opened on May 26, the formal opening taking place on Decoration Day.

The Taunton Y. C. announces the following fixtures: May 30, club race, start 2:30 P. M.; June 17, club race, start 2:30 P. M.; July 15, club race; July 21, club run; Aug. 12, club race; Aug. 17, ladies' day; Sept. 4, club race; Sept. 27, ladies' day.

Messrs. Bow & MacLachlan, one of the well-known Paisley firms of shipbuilders and engineers, have been commissioned by Mr. Andrew Carnegie, the American ironmaster, to build him a steam yacht of about 100ft. in length, for use in connection with Mr. Carnegie's recently acquired estate of Skibo, in Sutherlandshire. Her fit-up will include all the most recent improvements, and she will have the fine turn of speed for so (comparatively) small a yacht of fourteen knots.—The Yachtsman.

The regatta committee of the Corinthian Y. C. is considering the giving of a race for 35-footers in the midsummer series of the club, hoping to get the Bruce, Saltonstall and Loud boats, as well as some of the old ones. A class for the Quincy 21-footers will be made and some races will probably be sailed without time allowance under Y. R. A. of M. measurement and some with allowance under the Corinthian sail area rule. The waterline measurement will be the same under both rules—"waterline with crew on board"—and some interesting comparisons ought to be possible between the standing of the boats in the allowance and "no allowance" races. There is the best of feeling between the Corinthian Y. C. and the Association, in spite of the efforts of certain outside parties to exploit the club to the Association's disadvantage, and there are really but a few points on racing matters on which the organizations disagree. Classification is now practically the same, so that the Association boats race in the same classes in Corinthian races as in their own or-

ganization. The midsummer series promises to be the most interesting for many years.—*Boston Globe*.

The catboat building by Hanley for W. L. Ward, of New York, has been named *Windora*.

Mr. W. Butler Duncan, Jr., returned to New York on the *St. Paul* last week after a trip of several months abroad, a part of the time being spent on the Mediterranean, where he has raced the two-tonner *Mimosa*. He will take charge of *Defender* as soon as she is ready and will have command of her through the season.

The new steam yacht *Aileen II.*, designed by Gardner & Cox for Richard Stevens, was launched on May 13 at Roach's Yard, Chester, being christened by Miss Dorothy Sproul, of that city. The yacht is of steel, similar in model to *Malay* and *Sylph*, built last year, and is 150ft. over all, 125ft. l.w.l., 20ft. beam, 12ft. depth of hold and 9ft. draft. She has triple compound engines, 10, 16 and 25 by 16, and two Almy boilers. Mr. Stevens has chartered her to W. H. Patterson, of New York, for the season.

Niagara, steam yacht, Howard Gould, arrived at Ponta Delgada, Azores, on May 13, having left New York on May 3.

Mr. H. K. Wicksteed, whose designs of small cruisers are familiar to our readers, has just completed a boat for his own use in cruising about Lake Ontario this summer. She is similar to *Zulu*, whose lines were published in the *FOREST AND STREAM* of Dec. 10 1898, the same moulds being used, but the length over all has been reduced from 30 to 28ft. to fit the shop in which she was built, the l.w.l. is 17ft. 8in., and the centerboard has been replaced by a deep keel of iron, making the total draft 4ft. She has 520 sq. ft. on mainsail, jib and mizen, which she carried very ably, and her cabin, with just under 4ft. head room, gives good room for two in cruising.

The inaccessibility of City Island has always been the one serious drawback to a location which in other respects offers ideal advantages as a yacht building center. Even of late years, with the new Second avenue bridge and improved train service to Bartow Station, there is still the tedious ride of three miles in an antiquated bob-tail car, and formerly it was still worse. The many yachtsmen who have business at Wood's, Hawkins', Piepgress' and the other building yards will be glad to hear that a modern steel bridge is now under construction replacing the time-worn relic that has long joined the island to the mainland. This old bridge, by the way, once spanned the Harlem River at Third avenue, New York, being moved to City Island some time in the sixties, when the cast iron bridge that has lately been removed was built by John Roach. As soon as the new bridge is completed, in the course of the fall, a trolley road will be constructed from Bartow to the end of the island. It is now proposed to lay out a new system of streets in place of the primitive roads, the present Main street being widened to 80ft., while a roadway of the same width will be constructed entirely around the shore. The old Belden estate, on the extreme south end, may be converted into a public park. The main portion of the island is comparatively high, and offers excellent building sites, heretofore useless on account of the time required to reach them. One club, the Harlem Y. C., already has a fine house and station on the island.

Britannia, cutter, advertised at auction on May 10, was purchased at private sale shortly prior to that date. It is now said that the purchaser was Mr. W. G. Jameson, who had charge of her during her racing career, as the representative of the Prince of Wales, in which case it is probable that the Prince is the real owner. No modern yacht of equal fame has had such a sad fate as that of other, all equally ignorant of yachting. It is to be hoped *Britannia*, passed from one speculator or promoter to another, she has at last gone back to her original owner. Bona, the fast Watson cutter, has also been sold lately to Mr. J. Howard Taylor, of London. Two other famous yachts have been announced for sale at auction on May 10—*Formosa*, the noted 90-tonner, owned about 1880 by the Prince of Wales, and Mr. John Jameson's 90-tonner *Irex*.

Mr. B. B. Crowninshield, of Boston, has designed a light-draft schooner for C. H. Jones, former owner of *Chapaquoit*, who will use her in hunting and fishing trips to the Carolina sounds. She has an over-all length of 95ft., 70ft. l.w.l., 23ft. beam, and but 3ft. draft, more than this being inadmissible in the shoal waters for which she is intended. The cabin trunk will be entirely abaft the mainmast, and under it will be main saloon, three state-rooms and toilet room. The galley and captain's room will be under a smaller trunk cabin just abaft the foremast. The space abaft this, under the flush deck and abreast of the centerboard trunk, will be used for stores. A small centerboard may be placed in the seag aft. The yacht has only a moderate freeboard, and very well shaped overhangs. She will be built by A. J. Frisbie, of Salem, Mass., and will be finished by the end of August, going South in the fall.

At the meeting of the Corinthian Y. C., of Philadelphia, on May 11, it was arranged that the club knockabout races with the Seawanhaka-Corinthian Club, of New York, should be sailed at Essington during the week beginning June 5. The return races will take place at Oyster Bay during the week beginning August 28. P. A. B. Widener's new steam yacht *Josephine* and the schooner yacht *Coronet*, owned by John I. Waterbury, of New York, were placed on the club's roll. Lieutenant Commander F. A. Miller, U. S. N., and Meredith Bailey, Jr., of Ecuador, South America, were elected members.

If You Want the Whitest and Best

WHITE LEAD use "ENGLISH B. B." Of all paint dealers and of J. Lee Smith & Co., 59 Frankfort street, and F. W. Devoe & C. T. Reynolds Co., 101 Fulton street, New York.—*Adv*

During the thunderstorm of Wednesday afternoon lightning struck the beemartin gourds swinging from a pole erected on the premises of Supt. S. L. Dill, of the A. & N. C. R. R. The gourds were shattered and the martins killed instantly. The lightning split the pole from the top to the fence post to which it was nailed at the bottom and very nearly destroyed the post. It is a little singular that a pole of the same kind was destroyed by lightning on the same lot last year.—*New Bern (N. C.) Journal*, May 5.

Canoeing.

Repairs to Canvas Canoes.

Editor Forest and Stream:

In my little book, the "Manual of the Canvas Canoe," is given the following prescription for repairing cuts and punctures in canvas canoes: Appliances—A small malleable iron ladle with handle, a small alcohol lamp or stove, half-pint of alcohol, 10 cents worth of resin—which will probably serve for many cruises—lard, mutton, tallow, or other grease, a piece of 100z. canvas, a couple of small wooden chisels or scalpels, made of 1/2 in. twigs cut from the nearest tree or bush and flattened to a thin blade at one end.

Turn the canoe so that the canvas will dry in the sun; place a few tablespoonfuls of resin in the ladle, and melt over the alcohol stove; when at the seething point and thoroughly melted, put in half a teaspoonful or so of lard, mutton tallow or other grease; stir in until thoroughly melted; pour a small quantity of the mixture into a cup of water from the river; or water in which the canoe has been cruising, and when sufficiently cool to handle knead between thumb and finger; if too soft and pliable, add more resin; if too brittle, add more grease; the lump after being kneaded should be about the consistency of a lump of shoemaker's wax—fairly pliable. It is a nice matter to get the mixture of just the right degree of consistency, as if too brittle the patch will readily break off, and if too soft it will not stick. When the degree of consistency is determined, immerse a piece of canvas—a patch having been previously cut of a size amply sufficient to cover the cut—in the compound; stir in well with the flattened sticks while holding over the alcohol flame until the canvas is thoroughly coated and saturated with the boiling compound; remove quickly and place smoothly over the cut and plaster flat with the sticks, plastering the edges well down; use plenty of the compound. A large cut is better covered with several small pieces of canvas, as one large piece is difficult to immerse in the compound, as well as difficult to handle after being immersed. I have repaired a slit in a canoe a yard long in this manner. The canoe is ready to launch and use immediately after the patch is applied.

A correspondent, Mr. Edwin H. Pierce, of Auburn, N. Y., sends me the following, which he thinks is a simpler and better method than mine. I have never tried it myself, but give it on his recommendation:

Materials.—One small bottle of Le Page's liquid glue with brush. Bottle of thick asphaltum; a piece of heavy unbleached muslin, or light, close woven duck.

Method.—Dry the canoe in the hot sun, or by the camp-fire; smear the canoe and the patch with Le Page's glue; apply the patch smoothly, and smear the outside of it also with glue, running the brush from the center outward; if the edges of the patch fray see that the stray threads are well stuck down with glue; long threads should be cut off with knife or scissors. The glue not only holds on the patch, but strengthens the cloth, so that a thinner and neater lying patch may be used with safety; it also fills the pores of the cloth so that one coat of varnish—if time is an object—will suffice. If the sun is hot the glue will set in a few minutes—at the utmost half an hour—and then the patch may be painted with one or two coats of thick asphaltum, which will dry in a few minutes more, and if the work has been neatly done the patch will never wear off. Close woven, unbleached muslin will stick better than canvas. If the rip is a long and dangerous one, I put on two patches, one over the other, allowing the first to dry well before applying the second; the outer patch should be much larger than the inner.

COMMODORE.

The Eastern Division Meet.

The executive committee of the Eastern Division, with the approval of the commodore, announces that the annual meet of this division will be held on May 27 to 30, at Horn Pond, Woburn, Mass.

The camp is situated on the southwestern shore of the pond, easy of access, with a fine stretch of water for sailing and paddling courses, terminating very near the camp. The general location is very attractive and the ground is admirably adapted for camping. As heretofore, tents will be provided for those who desire them, if notice is received by May 24, and the mess tent will be in charge of a caterer, where meals can be obtained at reasonable cost.

The camp may be reached via southern division of the Boston & Maine Railroad from Boston, Lowell or Lawrence direct, by taking trains to Cross Street Station, thence over Lake avenue to the head of the pond, where a ferry will run to camp.

A special entertainment will be provided on Saturday night by the Innitou C. C., complimentary to the division. All canoes and camp equipage shipped care of the Innitou C. C., to Woburn, Mass., so as to arrive by Friday, May 26, will be carefully forwarded to the camp. Be sure to ship early to avoid delays.

The following programme of races for Tuesday, May 30, is announced by the regatta committee: Tandem paddling, single blades; one-half mile straightaway. Paddling, club fours, single blades; one-half mile straightaway. Paddling, single blade; one-half mile straightaway. Paddling, club fours, double blades; one-half mile straightaway. Tandem paddling, double blades; one-half mile straightaway. Sailing, unlimited; three miles. Sailing, upset. War canoe; one mile straightaway. Tournament, hand paddling, hurry-scurry, standing paddling, upset, novice sailing.

Events, course and distances subject to change at discretion of committee.

Please extend the invitation to attend the meet and join the A. C. A. to any canoeist whom you may know.

Membership application blanks may be obtained of the purser.

Per order of J. WINN BROWN, Vice-Com.

WILLIAM W. CROSBY, Purser.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

CANOEING NEWS NOTES.

The new book of the British Canoe Association, a very neat little volume in white canvas cover, has just reached us. In addition to the list of members, etc., it contains a portrait of Vice-Com. A. E. Wale, and some good views of the last meet, at Inchmoin Island, Loch Lomond, with a log of the meet. The camp this year will be at Falmouth, beginning on July 1. The officers of the Association are: Com., T. H. R. Bartley, Mersey C. C.; Vice-Com., A. E. Wale, Mersey C. C.; Rear-Com., J. P. Oliver; Hon. Sec'y-Treas., George Huntley, Gateshead-on-Tyne, England.

Trap-Shooting.

Fixtures.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 17.—Brooklyn, L. I.—John Wright's prize shoot at targets; commences at 10:30.

May 17-18.—Oil City, Pa.—Interstate Association's tournament, under auspices of Oil City Gun Club. F. S. Bates, Sec'y.

May 18.—West Chester, Pa.—Annual spring shoot of the West Chester Gun Club. F. H. Eachus, Sec'y.

May 23-25.—Macon, Miss.—Eleventh annual tournament of the Noxubee Gun Club; targets and sparrows; \$500 in merchandise and cash added. C. M. Seales, Manager.

May 23-25.—Algona, Ia.—Tournament of the Iowa State Association for the Protection of Fish and Game. John G. Smith Pres.

May 24.—Elkwood Park, N. J.—Contest for E. C. cup, emblematic of championship of State of New Jersey, between Messrs. Phil Daly, Jr., and T. W. Morfey.

May 25-26.—White Plains, N. Y.—White Plains Gun Club target tournament. G. H. Molenaar, Manager.

May 26-27.—Tyrone, Pa.—Target tournament of the Tyrone Gun Club. D. D. Stine, Sec'y.

May 30.—Rutherford, N. J.—Decoration Day shoot of the Boiling Springs Gun Club; good prizes. W. H. Huck, Sec'y.

May 30.—Canajoharie, N. Y.—All-day target shoot at Canajoharie, N. Y. Charles Weeks, Sec'y.

May 30-June 2.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

May 30.—Newburgh, N. Y.—Decoration Day shoot of the Glenwood Gun Club. Open to all. C. Hoppenstedt, Sec'y.

May 30.—Winona, Minn.—Winona Sportsmen's Club's tournament.

May 30.—Haverhill, Mass.—All-day shoot of the Haverhill Gun Club. C. F. Lambert, Sec'y.

May 30-31.—Buffalo, N. Y.—Decoration Day shoot at Audubon Park.

June 3.—New Haven, Conn.—Yale vs. Princeton.

June 3-4.—Sheboygan, Wis.—Sheboygan Rod and Gun Club's tournament.

June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.

June 6-9.—Sioux City, Ia.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

DRIVERS AND TWISTERS.

Under date of May 10, Mr. N. F. Reiner, secretary of the Centerdale, R. I., Gun Club, writes us as follows: "Inclosed find programme for our afternoon shoot on Decoration Day. This makes a nice little programme for an afternoon's sport, and should be well attended, as we have added \$7, and the price of targets is only 1 cent. Of course we do not expect to make any money on this shoot, but we wish to bring together all of our own State shooters, as well as some from Boston, Worcester, etc. I think if they will all come we will give them a good, fair and square shoot. This shoot is open to amateurs only. All expert shooters (paid shooters) can shoot for birds." There are nine target events on the programme, with a total of 125 targets, with a total entrance of \$7.50. Money divided by the equitable system; eight entries or less, three moneys. Over eight, four moneys.

Billy Crosby, of the Baker Gun and Forging Company, seems to have a strong affection for the Board of Trade diamond badge, the emblem of the live-bird championship of the State of Illinois. Last year, on June 9, he killed 10 straight in that event, and finally won the badge in a miss-and-out with a run of 88 straight, making his total 98 straight for the trophy. This year, at the Peoria tournament, he won the badge again, scoring 10 straight and following it up with 50 more in the ties. Thus in two consecutive contests for this much-coveted trophy, he has scored 158 live birds without a single loss. He shoots a Baken gun and 44grs. of E. C. powder, which is considered a light load by most trap-shooters.

In view of the fact that so many shooters have displayed skill and success in both target and live-bird shooting, it would seem to be a good juncture at which to have a championship trophy which would include both styles of shooting in its competition. Champion trophies are rather plentiful in each branch of trap competition; that is to say, at live birds and targets respectively, so that a trophy, the conditions of which required competition at both targets and live birds would be distinctive and useful. It further would have all the requisite broadness of competition for a genuine championship, if given under the best auspices.

Mr. C. C. Beveridge, in his wanderings, takes a few moments now and then to try his skill at the traps. On May 11 he was in Pittsburg, Pa., and participated in a shoot of the Greenfield Gun Club on that day. He averaged 96 per cent. out of the first 100 regular, and 94 out of the second 100 at all kinds of shooting. On the same day and place Mr. L. B. Fleming won in the 100 target event, scoring 97, and did it with a Winchester gun, Leader shells and Schultze powder. Beveridge scored 96 and H. I. Born 95.

Capt. A. W. Money, of most distinguished trap fame, took a trip Westward, starting on Saturday of last week. It is hardly necessary to add that he took his shotguns along and will tarry at St. Louis this week, where he will take part in the great tournament therein. If any man should have a craving for a match with the Captain, it is likely that he may be accommodated, if Eastern precedents are good in this respect. Capt. Money contemplates a trip to the Pacific Coast before his return.

The programme of the Glenwood Gun Club's spring tournament provides twenty target events, all at unknown angles, with a total entrance of \$10. Ten per cent of purses taken for average money for high guns. Targets, 2 cents. Amateurs who so wish may shoot for targets only. There are five merchandise prizes for amateurs. Programme events commence at 9:30. Refreshments and lunch on the grounds. Five-cent fare on trolley cars. C. Hoppenstedt, Sec'y.

The two weeks of May commencing on the 7th, should be kept in mind by all good trap-shooters, as the time of year when it is proper to smash things far and wide. In Mr. Litzke's report of the Illinois State shoot, elsewhere in our columns, will be found a most interesting lot of information on the smashing of targets and incidentally the smashing of records long undisturbed heretofore.

At the annual convention of the Illinois State Association, Chicago, was fixed upon as the place where the next Illinois convention and State shoot will be held. Mr. E. S. Rice was elected president of the Association, Mr. Thomas Marshall first vice-president; Mr. Thomas Laffin, second vice-president; Mr. W. B. Leffingwell, secretary.

The annual shoot of the Canajoharie Gun Club, May, 30, Canajoharie, N. Y., has fifteen target events on the programme, 15 targets to each event, entrance, targets included, \$1.30. Ten dollars in cash for best averages in events from 5 to 14 inclusive. Moneys and averages divided 30, 25, 20, 15 and 10 per cent. Targets 2 cents. Magauntr will be used. Charles Weeks, Sec'y.

Mr. B. W. Sperry, secretary-treasurer of the Charlotte, N. C., Gun Club, writes us under date of May 10, that "on May 4 a reorganization of the Charlotte Gun Club was effected. A large membership is assured, and we have ordered a magauntr, which will soon be placed. Col. J. T. Anthony was elected president and captain; B. W. Sperry secretary and treasurer."

Mrs. M. F. Lindsley (Wanda) left for her home in Cincinnati on Tuesday of this week. She shot in various events in the East, of which the most important was the Grand American Handicap. Mr. Lindsley also shot in this event, scoring 23, with one dead out. Mrs. Lindsley is famous as one of the few really good lady shots of America.

We publish portraits of the two squads which so recently distinguished themselves as breakers of world's records; one at Lincoln, Neb., the other at Peru, Ind. That of Peru had H. W. Cadwallader, J. L. Head, Ed Rike, F. D. Alkire and Dr. O. F. Britton. That of Lincoln had Frank Permelee, C. Young, W. S. Duer, A. B. Daniels and George Rogers in its make up.

The telegram from Mr. Litzke, elsewhere in our columns, mentions the victory of the Veteran Gun Club, of Kansas City, in the team race at St. Louis this week. The score was remarkably good, 58 out of a possible 60.

Mr. John G. Smith, president of the Iowa State Sportsmen's Association, Algona, Ia., informs us that programmes for the Iowa State tournament are now ready for distribution.

In a brief communication Mr. G. G. Zeth informs us that the Altoona Rod and Gun Club's tournament will be a rousing big one.

The White Plains Gun Club, of White Plains, N. Y., have arranged to hold a target tournament on May 25 and 26. BERNARD WATERS.

Garfield Gun Club.

CHICAGO, May 13.—At the Garfield Gun Club shoot to-day there was a good attendance. No. 6 event was three unknown traps, one man up. In the second trophy contest Von Lengerke was first with 24 in Class A, Thomas first with 21 in Class B, and Pollard first with 16 in Class C. The scores in this event were as follows:

Pollard	101011001111000110110111	16	Kuss	0111111111111011110111	22
Dr Meek	111111111111001110110011	20	Dr Shaw	1111101111111111101111	23

Fitchburg Rifle and Gun Club.

FITCHBURG, Mass., May 9.—The Fitchburg Rifle and Gun Club held its third shoot of the season May 8. The day was almost perfect for shooting, though a puffy east wind played havoc with some of the targets, making the scores somewhat erratic, only two straights being made, those being credited to Russell and Converse, while the rest had to be content with anything between 2 and 8.

Of course we could enumerate many excuses for the poor shooting, such as strange guns, new shooters, dark background, etc., but the chief reason is (to be honest) we're not on to it yet. But we have lots of fun, fresh air and sunshine, and best of all, get away from business for a few hours to enjoy freedom.

It looks now as though some of the shooters would be "all right" with a little more practice, and make a good showing in some of the team shoots, which we are in hopes to arrange with some of the clubs near by before the season is over. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Targets:	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10
Converse	9	6	6	7	10	7	6	7	5	8	3	8	5	5	5
Coleman	2	4	4	2	3	3	5	5	5	5	3	4	5	5	5
Estabrook	4	3	5	5	5	5	5	5	5	5	5	5	5	5	5
Cutler	5	6	4	8	6	6	8	7	7	7	7	7	7	7	7
Dix	7	3	6	6	8	8	8	3	6	6	6	4	4	4	4
Russell	5	8	9	10	5	8	5	6	7	7	7	7	7	7	7
Graves	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5

Edwards	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6

Events 1, 2, 4, 6, 7, 9, 11, 13, 15, known; 3, 5, 8, 12, 14, unknown; 9, reverse; 10, 5 pairs.

Woonsocket Gun Club.

WOONSOCKET, R. I., May 13.—The Woonsocket Gun Club held a practice shoot Saturday, in which eight members participated, enjoying the generally favorable weather conditions. Those who made good scores laid down the rule that "the soft gray light is the shooter's light par excellence"; others "could not see a thing." The new pulls were voted a success, and with the contemplated slight change in position of traps and shooting platform, will put the club in possession of a good ground and complete equipment.

Events:	1	2	3	4	5	6	7
Targets:	25	5p	25	10*	25	5p	10
Mills	21	6	20	6	21	4	8

Seagrave	3	7	3	7	3	7	3
Daniels	14	14	14	14	14	14	14

Haverhill Gun Club.

HAVERHILL, Mass., May 13.—Our Memorial Day shoot, should the weather be favorable, promises to eclipse the one of April 19. The Portsmouth, N. H., Gun Club, with their ladies, have been invited, and should any strolling shooter, at a loss to know how to spend the day, no matter from what State or Territory, he hails, be within a reasonable distance of Haverhill, he should by all means attend this shoot, and we will make him feel at home.

Our handicap prizes consist of sole leather gun case, 6 1/4 lbs. Du Pont's Smokeless, and 100 loaded shells as first, second and third prizes, members only to compete for same.

The programme calls for 10 targets in all except the two handicap events, with optional sweeps of 50 cents each, targets extra. Light lunch served free to all shooters and their ladies.

C. F. LAMBERT, Sec'y.

The St. Louis Tournament.

ST. LOUIS, Mo., May 15.—The Veteran Club, of Kansas City, won the team race, scoring 5

Minneapolis Gun Club Shoot.

MINNEAPOLIS, Minn., May 12.—The Minneapolis Gun Club held its regular Thursday afternoon shoot yesterday. There was a good attendance. The features of the shoot were the straight score of Catamaran in the Paegel Diamond Badge and the shoot-off for the junior club badge between Messrs. Parker and Remington.

The free bus running in connection with the Eighth avenue car line was kept busy the greater part of the afternoon accommodating spectators and shooters.

A great deal of interest is being manifested thus early in the season in regard to shooting.

All who are so inclined are welcome to attend the Thursday shoots. Several new members have been elected of late and the old members are beginning to enthuse. The following are the scores in the different events:

Val Blatz diamond badge, 15 targets, unknown angles:	
French	10101111101011—11
Biffon	1110111111001—12
Parker	1101010111111—14
Hays	11010101110111—11
Nelly	11111101011101—12
Dr. Bill	11111101011111—13
Nelson	1101111011010—11
Mrs. Parker	1101110100010—8
Morrison	1101100100010—8
Black	11111110010101—11
Thompson	1111111111111—15
Catamaran	0101011111101—12
Remington	10010001010110—7

Thompson won the badge.

The Paegel diamond challenge badge, 15 targets, unknown angles:

French	1011111111101111—22
Biffon	111111111101010111—22
Parker	10111101011111110111—21
Hays	11001011111111110111—21

Mrs. Parker	1001001101001	1001001101001

Thompson won the senior badge; Mrs. Parker won the junior badge, and Neely won the amateur badge.

Upon The Heights.

BATAVIA, N. Y.—Editor *Forest and Stream*: I can remember Altoona when it was a scrub city, with board walks, a Pennsylvania Railroad town with a population very cosmopolitan. To-day Altoona is one of the considerable towns of the great commonwealth of Pennsylvania, and that is saying a good deal, because Pennsylvania is considerable of a State. Altoona is a very easy place to reach, but mighty hard to get away from. I arrived there on a certain date and arranged to leave on a certain date. I will not pause to explain here why it was that I did not make connections with the intended train. Suffice it to say, that the combination made up of Dr. Christy, Mr. Hauck and Mr. G. G. Zeth, most effectively checked any schemes that I had for a further move west.

On greeting a gentleman sportsman (whose name I cannot now remember), said he was glad to see me, and hoped that I would attend the Altoona tournament. He further remarked, "By the way, have you ever been to our shooting grounds on Wopsononock Heights?" I remarked that I had never visited Wopsononock Heights, but hoped that the pleasure would not be long denied me.

An hour afterward I had the honor of being introduced to Dr. Christy, and after some preliminary conversation, Dr. Christy said, "Have you ever been to our shooting grounds on Wopsononock Heights?" I remarked that I had never visited Wopsononock Heights, but hoped that the pleasure would not be long denied me.

Later in the evening I had the honor of being introduced to Mr. Hauck, and after some conversation upon the crops and the early spring and rather warm weather, he remarked, "By the way, have you ever visited our shooting grounds on Wopsononock Heights?" I remarked that I had never visited them, but hoped that the pleasure would not be long denied me.

At that moment Mr. G. G. Zeth made his appearance, and to whom I was at once presented, and after a few remarks upon the crops and weather, growing grass and singing birds and the general forwardness of spring and the fine condition of business in Altoona, he remarked, "By the way, have you ever visited our shooting grounds on Wopsononock Heights?" I remarked that I had not, but hoped that the pleasure would not be long denied me.

By this time, I was impressed that the shooting grounds on Wopsononock Heights were well worth visiting, and remarked that I should feel rather slighted if an opportunity was not afforded on this occasion for me to visit the shooting grounds on Wopsononock Heights. Mr. Hauck replied that the opportunity would be afforded me on the morrow; that a special train would be made up in my honor and in his charge as superintendent of the road, we would make the trip, and since this visit

I can understand why the gentlemen composed of the Altoona Shooting Club were so very enthusiastic over the location of their grounds, situated as they are, nearly 3,000ft. above sea level; for there is nothing like it in this country, and that means in the world. The magatrap is set so that the birds are thrown into space, and you watch them as they whirl through the air, sink and melt away from the vision in the abyss. Taking into consideration the whole situation, the position of the trap, the background, the mountain ranges laid out by nature's precise mathematics as far as the eye can reach, the valleys in sight, of which I may mention the Bald Eagle, Bells Gap, Homer Gap, Riggle Gap, Juniatta Gap, Dry Gap, Burgoon Gap, Kittanick Point and Bennington Gap, all forming a picture, under the rays of the setting sun, most exquisite.

Imagine, if you please, this magnificent view, with a background of the setting sun, veiled by golden clouds, each mountain peak brought out in bold relief, their sides reflecting the shimmer of the golden glory of the West, while further down their sides the light playing into deeper shadows, causing modest rainbow tints of surpassing beauty.

If the sunsets are beautiful, the mind runs riot in contemplation of a sunrise view from Wopsononock Heights. The weary trap-shooter, retiring at as early an hour as he usually does, presuming that he is staying at the Wopsononock House, rises the next morning just as day is breaking, and throwing open the lattice, looks over the mountains, waiting for the coming of the day. Brighter and still brighter grows the light in the east. Then comes the first rosy streaks heralding the coming of Old Sol. Brighter and brighter grows the horizon, the glow of the morning light is upon the mountains, and while he is drinking in the beauty of the scene, he sees the rim of the sun covering the mountains with a blanket of light. A few moments more and the valleys are brought out of the shadow and the day has begun. Gazing on the magnificent spectacle, he drinks in the freshness of the morning, and he feels glad that he is on Wopsononock Heights. It is well worth the trip up there to see the sunset or a sunrise to say nothing of the good entertainment at the Wopsononock Heights hotel. Dr. Christy informs me that the air on the heights has great health-bearing properties, and avers that it contains 88.7 per cent. of ozone, and this, I am confident, cannot be said of any other mountain range in the United States; and I have crossed them all. In fact, the Doctor thinks that there is enough ozone in the air on Wopsononock Heights that if it would be captured, so to speak, and bottled and used with a certain percentage of low land oxygen and properly administered, life would be prolonged almost indefinitely. I trust I shall not be charged with free advertising in favor of the wonderful shooting grounds at Wopsononock Heights, near Altoona, only I urge all sportsmen good and true to attend the Altoona tournament next month, and there receive in return fourfold for any time or money expended in the visit.

The other day a friend of mine showed me a flint lock pistol with 1½ in. barrel; a gentleman's pistol of long years ago. My friend does not own that pistol now; it is in my collection; and speaking of old things, it reminds me of John Krider's store. Any visit I make to Philadelphia, I endeavor to get down there to the old place, simply to look at it, and sometimes, when Uncle John Siner is in a reminiscent mood, listen to his stories of the long ago. I invariably approach the store on the opposite side of the street, in order that I may get a good view as possible from the pavement to its old gable. This old pile was erected by Wm. Penn. in 1734. In it we see the same old bricks, window casings and I believe the very same old show windows, that in their very dust and quaintness endears them not only to the antiquarian, but the sportsman as well. There are the very same counters, and the bench at which John Krider and others before him worked. This old store was opened as a gun store, if I am correctly informed, in 1836, and all the old-time sportsmen, of which we have any record in this country, almost have at one time or another purchased their supplies at this dear, funny old place. Henry W. Herbert (Frank Forester) has loafed in there, and talked gun and dogs with other of his friends. Uncle John Siner has been there since 1843, and among the pleasant stories he tells is one of Mr. Hazard, whom he described as a fine-looking gentleman who came into the store one morning, and in a hearty manner said, "Good morning, Krider," as if he had always known him, "I want you to try some of my powder; here is a sample; I think your customers will like it well enough to give it a trial." It would appear that up to this time there was no powder used, or known to sportsmen but Du Pont, unless indeed some canisters that found their way here from England. They were, however, willing to try the new powder, and later commended on its merits, finding it to be a very excellent powder. Mr. Siner tells of the cranks of those days, and of a way that they had of testing the cleanliness and quickness of powders. They would place small samples of the varieties on clean boards and flash them, observing the quickness of ignition and combustion, and looking critically for residue, greater or less, remaining. Mr. Siner told me of fine flint lock guns that he saw when a boy, and later some of the exquisite pieces of workmanship with the cap locks. Speaking of these guns and the men who made them and the times they were used, we were for an hour living in the past quite sixty years ago.

Before concluding, I want to speak of another old-timer, Mr. Chas. Weis, Erie, Pa., who is now approaching his seventieth birthday. I had a most interesting visit with him a short time since. He spoke of the time when they hunted deer as a business for market, when it was considered all right, and said that in his time he probably had killed over 1,200 deer and five elk way back in the 40s. He says the last elk killed in Pennsylvania was shot by Henry Haines, in 1858. He speaks of rifles weighing from 10 to 16lbs., having carried one himself of about the latter weight, and referred to the introduction of the percussion lock with a cap, and the percussion pill used prior to that, which was laid in a cup over the vent and struck by a hammer. In our day, we can scarcely believe that elk ever roamed the forests of Pennsylvania. We now associate them with Western game only, and conjecture the abundance and variety of game in the Middle States prior to sixty years ago.

DICK SWIVELLER.

St. Paul Rod and Gun Club.

ST. PAUL, Minn., May 6.—Herewith are scores made at our shoot Saturday afternoon at Kittsondale grounds. Twenty-five shooters faced the traps, and some excellent scores were made, F. Novotny carrying off the honors with a straight score. The senior badge was won by Morrison, and the junior by P. Hanser. Novotny was a visitor. We have put in the Sergeant system, and it proves very satisfactory. The weather was all that could be desired. About 2,000 birds were thrown.

No. 1 was at 25 targets, unknown angles, for the badge:

Bennett	010101111111111110110—21
Spear	1101000001110101001100—14
Moore	111111111111111111011—23
Martin	110000010101011111101—17
F. Novotny	11111111111111111111—25
Perry	1001010010001111101001—14
Morrison	11111111111101111111—24

E. Novotny	1111011111	10 11 10 10 10—15

A. E. PERRY, Sec'y.

In a match at 100 targets for \$25 a side, Mr. W. N. Sanders defeated Mr. B. H. Norton, May 10, at Lyndhurst, by the score of 68 to 54. There are no grounds which try a man's skill out more thoroughly than those of Tom Morley, as many have found by a falling off of their scores and confidence in their ability.

WESTERN TRAPS.

At the Illinois State.

CHICAGO, Ill., May 12.—This seems to be a year of double winnings. Tom Marshall is the biggest two-times winner of the year, and another Illinois man, Billy Crosby, of O'Fallon, has just won for a second time one of our most important Western trophies, the Board of Trade badge, of the Illinois State Sportsmen's Association, at Peoria. Mr. Crosby had to kill 60 straight to secure the medal, against 98 last year in the ties. Mr. Leisy, of Peoria, dropped out at the 59th bird, and Chas. Powers, of Decatur, killed 57 before he retired. There would seem to be shooting at Peoria this week. Thus Mr. Powers ran 180 straight in targets before he met misfortune. All the glory seems to go to the lower part of the State, for the Smith cup and the target championship was won by a Peoria man, Mr. F. C. Kiehl.

Chicago Clubs.

Our main interest centers in Peoria this week, but both Eureka and Garfield clubs will have good representations at their grounds this week.

On next Monday Mr. Oswald Von Lengerke and Mr. Walter Du Pee will resume their argument on the pigeon question at Watson's, Mr. Du Pee thinking that he can beat his competitor with his handicap of 4 birds added to his score. Mr. Von Lengerke thinks he can give the 4 birds and still win. And there you are.

Mr. A. W. Adams, president of the Eureka Club, is home and in good working form. He will do business at Eureka grounds henceforward.

St. Paul.

The St. Paul Rod and Gun Club has commenced its season of activity at the traps, and on May 6 held a nice shoot at the Kittsondale grounds. Mr. F. Novotny, a visitor, killed 25 straight. Morrison won the senior badge on 21, and P. Hansen the junior badge with 21. At unknown angles, other scores were: Thompson 21, Spear 14, Moore 23, Martin 17, Fonda 18, Perry 14, Ramaley 17, C. Hanson 14, Leibrock 16, E. Novotny 21, Hirsch 24, Murray 17, Hudson 14, George 11, Wood 22, Wild Rice 18, Graaf 10, Emmerson 15.

Trap Around Reading.

READING, Pa., May 6.—The Mt. Penn Gun Club held the first of a series of shoots for a gun on their grounds to-day. Ball won to-day, breaking 22 out of 25 targets, thrown by the magatrap. The scores in the first shoot for the gun were as follows: Ball 22, Yeager 21, Coleman 20, Hunsberger 15, Stock 15, Henry 16, Brown 16, Boyle 12. John Shafer officiated as referee in the above event. Sweepstakes followed. The scores were as follows:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	10	10	10	10	10	10	Targets:	10	10	10	10	10	10

Team Shoot.

This event was started immediately after the ties in the diamond badge contest were decided, which was after dinner, Wednesday. There were fourteen clubs represented in this race, and fifteen were entered. The conditions permit each club to enter two teams, but only the local ones availed themselves of this opportunity.

The programme stipulated that the entry in the contest would be \$20 per team, but some of the clubs protested against this, so it was changed to \$10, or rather the price of the birds. Thus there was nothing but the added money to contest for, which amounted to \$100, and was divided 50, 30 and 20 per cent.

The Du Pont Gun Club, composed of Marshall, Bingham, Crosby and Powers, and the Peoria Gun Club No. 2, represented by Portman, Heilman, Shoff and Sammis, tied for first on 39 out of 40, Crosby and Heilman being the unfortunate ones.

Rock Island and Pekin clubs tied on 37, and divided second money. Four clubs tied for third, Alcedo, Genesee, Canton and the Alpine of Chicago.

First money netted each team \$25; second paid \$15, and third remunerated each to the extent of \$5.

Individually and collectively the shooting in this event was very good, as altogether these teams averaged nearly 90 per cent., six being the lowest scored by any of the principals, while straight scores were numerous.

The birds were a mixed lot, improving as the race progressed. On the first day there was no wind, though there was a light breeze on the second day.

It is well to understand that this event began on Wednesday, and was not decided until the following day.

The conditions were four men to a team for the club team championship, 10 birds per man, 40 per team; entrance price of the birds, for a purse of \$100, three money, 50, 30 and 20:

L. C. Smith Cup.

This trophy is indicative of the State championship at inanimate targets, and the competition is entirely different from the other target events, it being shot one man up, three unknown traps, 20 targets per man. These conditions were evidently not to the liking of many, as the entry in this race was not very big, only thirty taking part in it. Of this number Reihl, Crosby and Ruble broke straight. They decided to divide the proceeds of the entry next year, and shot off for the cup. Everyone expected that this would be a closely contested shoot-off, but it came to a very quick termination, and only nine targets were needed to reach a conclusion. Reihl scored all of his, but Crosby could get no further than his 6th, while Ruble lost his 5th. Mr. C. F. Reihl is a comparatively new shooter and hails from Alton, Ill. He used a Parker, Leader and Du Pont. Powers, J. Hoff and Stannard divided second money, \$70, and shot off for the 300 shells that were at issue. These Powers won, but generously gave them to Hoff.

Geo. Roll shot out Marshall and De Wolf, who were tied on 18 with him. This gave him a fishing rod. They of course divided the \$50. Seven tied on 17, and divided \$40, while Morgan, of Chicago, and Harris shot out the others and divided the six quarts.

The conditions of this event were 20 targets, three unknown traps, entrance \$5, birds extra. Winner this year to receive all the entrance next year. The scores:

Geo Reihl	11111111111111111111-20

PAUL R. LITZKE.

IN NEW JERSEY.

Sanders-Norton.

Lyndhurst, N. J., May 10.—On the grounds of the Lyndhurst Association to-day, in a match at 100 targets, \$25 a side, Mr. W. N. Sanders beat Mr. B. H. Norton. Score 68 to 54.

Two sweeps followed: In No. 1, 15 targets, the scores were: Sanders 8, Norton 7, Packard 13. No. 2: Sanders 10, Norton 9, Packard 6.

Trap at Singac.

Singac, N. J., May 10.—Messrs. J. H. Fletcher and Arthur Bunn shot a match here to-day at 25 live birds, the conditions of which were that each stood at 25yds., the former having three extra birds to shoot at. He won out on even terms, hence the extra birds were not required to finish his competition.

There also was a match on for to-day at 50 live birds between Messrs. Bunn and Moffett, but owing to other interests engaging the attention of the latter, he could not be present, and the match in consequence did not come off. The birds were barely an average lot, though there was an occasional good one, of which Fletcher's 10th, 11th, 12th, 13th, 14th, 17th, 19th, 21st and 22d were noticeable, and the same applies to Bunn's 5th, 7th, 12th, 19th and 21st. The score follows:

New Jersey Central League.

Dunellen, N. J., May 13.—The first League contest of this Association took place to-day. There were three teams in the contest, one from the Climax Gun Club of Plainfield; one from the Dunellen Gun Club, of Dunellen, and one from the Reservoir Gun Club, of New Brunswick. There were five men to a team, 25 targets to a man.

At the annual meeting officers were elected as follows: President, J. G. Lindzey; Vice-President, T. H. Keller; Secretary and Treasurer, H. B. Smith. The conditions governing the shoots were not changed. Contests take place on every other Saturday, and the next one is fixed for May 27, on the grounds of the Reservoir Gun Club, at New Brunswick, N. J.

The team contest was as follows: Climax Gun Club of Plainfield—Apgar 20, Manning 19, S. Terry 19, Goodman 16, Lambert 16—90.

Dunellen Gun Club, of Dunellen—Runyon 22, Osborn 18, Fletcher 16, Giles 15, Lindzey 13—84.

Reservoir Gun Club, of New Brunswick—Belloff 21, Keller 20, Hovey 15, Strong 13, Smith 12—81.

Sweepstakes were shot, and the scores are added hereto:

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, L. I., May 13.—The attendance of visitors was quite large, considering that the weather indications were not of the best. Dr. Kemble was in fine form, and shot exceedingly well. No. 4 was a handicap prize shoot. The handicap allowance in this event follows names in the list of shooters. All tied in the main event on shooting their allowances. Then the ties were shot off on 15 singles and 5 pairs, the scores then being as in event No. 5 in the scores. On the second ties Kemble, Scheubel, F. S. Thompson and Bramwell tied.

Events:	1	2	3	4	5	6	7	8	9	10

Fort Smith Gun Club.

FORT SMITH, Ark., May 9.—On May 9, after the races were over, the shoot of the Fort Smith Gun Club, which had been postponed from Saturday on account of rain, was run off. Several new shooters were present, Messrs. Clark and Trobridge being among the number. Both shot exceedingly well considering that it was their first effort over the grounds of this club. The day was fine, the birds were not thrown hard, but the shooting was horrible. Nothing like it has been seen on the grounds prior to this time. Everybody had an "off" day, and it seemed that no one could make a run of 10 straight, nor was it done during the day. Following is the score:

Shot	at	Broke.	Av.	Shot	at	Broke.	Av.
Leach	50	34	.680	Trobridge	26	18	.600
Baptiste	50	32	.640	A W Boyd	50	22	.440
Matthews	50	31	.620	C H Boyd	50	18	.360
Clarke	40	20	.500				

SECRETARY.

Boston Gun Club.

WELLINGTON, Mass., May 12.—Good scores resulted at the last Wednesday shoot of the Boston Gun Club, at Wellington. Fine weather conditions aided of course, and it only remained for somebody to take full advantage of them. Mr. Griffith, of Pascoag, R. I., proved the man of the hour, scoring 91 out of his 100, placing his 30 straight in the match in his usual quiet fashion, yet none the less decisively. His targets throughout the shoot were centered well, denoting accurate aim and steady hold, with probably also his frequent practice over a magautrap, standing him in good stead. At the conclusion of the match he was warmly congratulated by the home crowd, who are sufficiently sportsman-like to rejoice as much when a visitor walks off with the honors after earning them as when it is one of themselves.

Others shot well too. Mr. Howe with 86 targets, six 9s and four 8s out of 100; Gordon, Allison, Leroy, Miskay and sheffield with at least a small straight. Scores:

IN FLORIDA.

No State in the Union presents an example of more wanton, foolish, wasteful and devastating game destruction than Florida. Within the memory of those who are comparatively young, the vast areas of the peninsula have been converted from districts which were fairly superabounding in game, to what are now barren wastes, where one may travel for days and catch sight of nothing but vermin. Florida has been overrun for years by wanton butchers, who in the name of sport and in the guise of sportsmanship, have slaughtered without let or hindrance. Now at this late date the horse having been stolen, Florida is locking the stable door with a padlock of formidable strength.

The Legislature this year has enacted a law which embodies some of the most stringent provisions of the advanced game legislation of the day. With respect to deer the FOREST AND STREAM Platform Plank has been adopted; the new statute provides that deer may not be sold at any time. A non-transportation provision has been adopted with respect to wild turkeys and quail or partridge; the law forbids the carrying of this game from one county to another, except that hunting parties may take their own game home with them. Export of game beyond the State is entirely prohibited. Limitations are put upon the amount of game. The shooter is restricted to four wild turkeys in a day and twenty-five quail; and a hunting party to six turkeys and fifty quail; and until 1905 one person may not kill more than five deer. Restriction of this nature are among those to which the objection is made that they cannot be enforced, since it is impossible for anyone except the individual to know how many birds or how many deer he has killed in a day or in a season. On the other hand one prevailing influence of such legislation is that it teaches a new idea. It inculcates an appreciation of the fact that the taking of wild game by the individual citizen is a privilege which may be accorded to him in just such degree as public interests appear to warrant, and if once a comprehension of this principle can be instilled into the public mind, the cause of game protection has been materially advanced.

The provision of the new law which will excite the most comment is a non-resident license section, requiring that before hunting for the purpose of killing any wild deer, turkey or quail in any county, a non-resident must apply to the clerk of the circuit court of the county for a permit to hunt, paying for it \$10. The money so collected is to be used for the purpose of paying the game warden of the county. The chief intent of this provision appears to have been to provide funds for enforcing the law. Public opinion in Florida is so apathetic in respect to the preservation of game and the execution of the laws that we cannot help thinking these stringent enactments so far in advance of public opinion that their enforcement will be difficult; and the new law is likely to be a dead letter precisely as the old law was. It would manifestly have been impossible to secure from the Legislature an appropriation for the purpose of paying the game warden, and the non-resident clause therefore has been adopted as an expedient for raising the necessary revenue. If Florida had begun in 1865 to hold to account the men who invaded its borders with rifles and shotguns, and who crimsoned the shores of its rivers with the blood of wild creatures slain in wantonness from the decks of passing boats, and if it had educated its own citizens to a point of decency where they would not have killed deer the year round, including does heavy with young, there would still be an abundance of game and an alluring attraction for non-residents. As it is now, the fields are so barren of birds, that the number of sportsmen tourists in Florida has of recent years greatly decreased.

We note in some of our Florida exchanges criticisms upon the statute, based upon the ground that it is unconstitutional, as being in conflict with the Federal Constitution which declares that "The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States." While non-resident game laws have not been tested in the higher courts on this ground, we repeat what we have said before, that in the light of decisions bearing upon the question, notably in the case of Greer vs. State of Connecticut in the United States Supreme Court, there is reason to believe that the constitutional authority of the State in the protection of its game extends to and includes the right of discrimination against non-residents.

THE "ALL" OF IT.

THE guild of anglers owes much to him or her who first expressed in words the truism that "it is not all of fishing to fish." Vague as it is in generalization and negative as a definition, it is nevertheless readily accepted as a self-evident proposition, clear, concise and a tenet of the guild; for does not every reader or hearer of it, who has experienced the delights of practical angling, know complementary elements which truthfully constitute the "all"? The sport of angling so abounds with pleasure that one has but to look back in one's own experience to assent to the tenet that "it is not all of fishing to fish." In its incomplete negation, it in no wise offends the beliefs of anyone, nor does it exalt any part of the sport above others. Each individual is left free to enjoy his own affirmative. Past experiences and delights of memory are left undisturbed by it, though brought to mind in the pleasure of living them over again.

There are no opportunities for opposing opinions as to what constitutes the "all" of fishing when each one has his own experiences, and his own supreme judgment as the definition and final test to determine it. In its wealth of wholesome means of enjoyment, there is that variety which in whole or in part pleases the taste of all who engage in it. In this lies its greatest charm. Given the fishing as a motive, the devotee relaxes from the cares and struggles of business, and goes forth to where there are clear waters, in a setting of woods and fields, rich in nature's own colors, and all fragrant with the odors of the world's great laboratory. Thus, as to what fishing really is each angler is a law to himself, as to its pleasures. If each angler were to attempt to define its pleasures and fascinations, there would hardly be two definitions precisely alike even in idea. Each one is governed by his own experiences, habit of thought and emotions; but such is the subtle witchery of the sport that each follower of it has a personal interest and sympathy in the doings of his fellow in sport, however radically his ideas and practice of the pastime may differ from his own.

Your true sportsman is distinctly unselfish in his pleasures. He delights in the company and participation of congenial fellows, and if that pleasure is or is not denied him, he writes out his story, if he is of the true spirit, narrating the doings and incidents of his outing for the delectation of his brethren who are "chained to business," thus in a way sharing his pleasures with them. There is thus an infinity of side lights for those who are denied participation, and a constant adding to the store of affirmation that "it is not all of fishing to fish." So long as nature's moods and works change constantly, presenting new pictures and new ideas to him who notes them, the literature of fishing will grow and grow without ever reaching a full telling of what it really is, though the tenet that "it is not all of fishing to fish" will ever hold good.

THE NEW JERSEY PROTECTOR.

FROM many sources come evidences of the deep feeling entertained by New Jersey sportsmen respecting the appointment of State Fish and Game Protector. The present incumbent of the office is Mr. Chas. A. Shriner, of Paterson, whose entire record is that of an exceptionally capable, devoted and efficient officer. Mr. Shriner's record is one of which any public official might well be proud. He has done his duty intelligently, fearlessly and honestly. In all the years of his service we have never heard one word in question of the conduct of his office, except in certain cases seized upon by a sensational press for strictures based upon alleged conditions which did not exist in fact. To Protector Shriner the former Fish and Game Commission owed in large measure the shrewdness and executive efficiency of its administration. We are convinced that the members of the old board would fully and freely bear their willing testimony to this fact. In particular we know that Mr. Howard P. Frothingham, president of the old commission, and of the one now in office, has expressed himself unreservedly in appreciation of the value of Mr. Shriner's co-operation with the board both in enforcing the laws and in conducting the fish stocking enterprises.

For what reason then, the citizens of New Jersey are asking themselves, can there be any question of the retention of Protector Shriner in his present place? If his public record and the minutes of the commission and the estimation of the commissioners themselves testify to his capacity as an officer, why should there be any doubt

of his reappointment for another term? The question is one which finds ready reply. It is a matter of politics. For no other reason would a commission of four business men charged by their obligations of office to care for the public interest of the commonwealth think for a moment of dispensing with the services of the man known to them to be the one best fitted to serve those interests. If Messrs. Frothingham, Halsey, Morris and Budd were to conduct the affairs of the commission as they would manage their own private interests, they would never entertain the thought of losing Mr. Shriner. No more would they consider such a thing in the management of the public business, were they altogether unhampered by political complications, and free to manage the affairs of the commission as they would their own.

The situation then, divested of befogging politics, is perfectly simple and clear; and the duty of the commissioners in the premises is plain. Having in view only the interests they have been charged to uphold, they should disregard all other considerations, recognize their obligations to the public alone, and pursue the course which will make for the advantage of the State. No weighing of action in the false scales of politics can make wrong right or right wrong. To put into the protector's place the best man available will be to insure the continued usefulness of the service; to throw that man overboard in obedience to a dictation which is inspired by antagonism to the cause of game protection and fish stocking will be to sacrifice at once the public interest and their own place in public esteem. As between a Governor who has openly declared that all game and fish laws should be repealed and the Game and Fish Commission should be abolished, and a commission guided by a determination to uphold the laws and replenish the fish supply, the people will be with the commission every time, and all the time.

We have said that there exists deep feeling on this subject in New Jersey. The existence of the feeling is not enough. It should be given expression. We urge then upon New Jersey sportsmen the imperative duty of making known to the Commission the sentiments so freely expressed in private. It is a time for something more than talk if New Jersey does not wish to see its game and fish interests sacrificed. The Commission, through its President, Mr. Howard P. Frothingham, of Mt. Arlington, should be apprised of the public feeling on the subject.

SNAP SHOTS.

The fundamental principle of the poultry yard industry is that if you would have broilers you must set your hens and hatch out chickens. No one ever yet reaped a fortune from the chicken business by killing off the last hen in the yard and then waiting for eggs to rain out of the sky. This, however, is what we have been doing with our game for so these many years; and only just now are we coming around to the poultry yard recognition of the principles involved, and beginning to farm our game fields as we would our chicken yards. In a quiet way there has been during the last season a very large restocking of fields with quail and pheasants. This has been carried on with a thoroughness and scope in New Jersey unequalled elsewhere by public authorities. Importations of quail have been brought from the Indian Territory and distributed here and there to the care of land holders who would undertake to protect them from encroachments during the breeding season; and there is every reason to believe that the results of the present enterprise will prove as successful as have been those of recent years in the same State. The New Jersey authorities have now engaged in this branch of game restocking long enough, and on a scale sufficiently large, to determine that it is a practicable and satisfactory expenditure of effort.

We used to have frequent letters from Havana recounting the excursions of the Cuban Field Sports Club, but the pleasant correspondence was long since interrupted by the grave complications which for the time prevented indulgence in the pursuits of the field. Now that various reforms are being instituted, it is probable that suitable game legislation will be adopted; we have a communication from our whilom correspondent intimating as much. In course of time Cuba may become a winter resort of American sportsmen.

If the waninish were found in the Wabash and a Wisconsin angler were to fish for them there, retaining the ancient spellings he would be described as a man from Quisconsin catching ouananiche in the Oubouskigon.

The Sportsman Tourist.

The Lazy Indian.*

NOTWITHSTANDING that Indians are so generally called lazy, I think there is a good deal to be said on the other side. Did anyone ever see an Indian lazy when he had an object to call him out? Did anyone ever see a white man more active, more energetic, more alert, or more tireless and patient about his task than an Indian when he has an adequate motive?

Are Indians ever lazy when they are on the fresh track of a deer? On the contrary, they are so full of life and vigor that a white man's movements seem lazy and slow in comparison. When they are diving in the river for salmon they are not lazy. After they have learned the use of money, offer them \$2 a day to build a brush house or do any work they are familiar with, and they will not be lazy, but will work with surprising agility. We see consequently that when they are doing nothing and appear to white men to be lazy, it is not because they have no work in them, but because they have nothing to do, or have no motive for doing anything. Give them something to do that they think is worth doing, or give them a motive, and you will find there is work enough in them. If they have nothing to do and have no motive for working, how much are they to blame, and how are they any different from white men for not working? If a white man had nothing to do and no motive for doing anything, he would perhaps be as lazy as an Indian.

The necessity of working to earn a living and the opportunities to go further and get rich are what keep the main body of white men at work, and here lies the explanation of the Indian's apparent indolence. With them there is no necessity for earning a living, and no opportunities to get rich. Bountiful nature provides them every year with their daily food, and all they have to do is to gather it. No need of their working every day from morning until night. It would do them no good if they did. When they have procured food enough to sustain them and covering enough to keep them warm, all work beyond that is thrown away. If they worked twenty hours a day they could not improve their condition any. Then why should they work? It is not necessary for them to earn their living. This motive to work, the almost universal stimulus to labor among the civilized races, does not exist for the Indian. Suppose it were wholly withdrawn from the lives of white men; would they be much more industrious than the Indians?

Besides this, the Indian cannot practically increase his wealth. His wealth lies in the countless red berries of the manzanita bushes abounding in the hills, and in the millions of acorns on the oaks of the forest, and in the endless migrations of salmon past his wigwam. No work that he can do will make him any richer. No idleness or laziness of his will make him any poorer.

His wealth consists in the stocks that he owns in nature's great granary, and these will yield the same yearly dividends whether he works or not. His labor cannot increase the value of his stock or raise his dividends a particle, nor can his idleness depress the stock or reduce the dividends. He has no hope of getting any richer nor fear of getting any poorer.

Consequently the chief motives for work that civilized races have the Indian is wholly destitute of. The power and desire to accumulate property is what makes civilized men work, because they will get richer for it. But neither the power nor desire to accumulate property exists among the Indians, and if they did work they could become no richer for it. Allowance ought to be made for this in passing judgment on the Indian's often-quoted laziness.

Suppose now that at this moment every person in the town or city which the reader lives in had an independent income, which he could neither increase by his work or diminish by his idleness. Should we have any lazy people in the community? Would not three-fourths of them become lazy? Wherein are the Indians any worse?

It ought to be explained here that almost all Indians appear nowadays to a great disadvantage in everything, owing to the very demoralizing effect of their acquaintance with white men, and this is particularly true in regard to their activity. We do not see them now in their primitive character. When the overland train nowadays stops at a station in the far West and one sees a group of listless Indians loitering about the platform in dirty, white man's clothes, one gets about as correct an idea of these Indians in their normal primitive wildness as one does of a panther in a caravan, that lifelong captivity has completely disheartened, and that has had all his native life and spirit whipped and poked and teased and starved out of him. We do not see the Indians in these times as they appeared a century or more ago, when they were proud of their individual exploits and physical accomplishments, when their deeds of skill and bravery were appreciated and admired, when they took pride in the power of their bows and arrows, and ate thankfully and proudly the fish they had captured, and the acorn soup their women had made for them; when they were proud of their mountains, plains and forests, when the course of their lives was as full of interest to them as the child's play is to the child, and they entered into their life with a corresponding zest. Now all this has been changed. Their spirits are broken. Their pride is gone. The white man's rifle has made them ashamed of their bows and arrows. The white men's sneers have made them ashamed of their home-made soup and dried fish. Individual prowess is of no account, now that gunpowder and lead can do so much more.

They have nothing to be proud of now. The great, powerful race that has come like a cloud of locusts upon them swarms over their hills and plains and forests, and what was their pride is now their grief and shame. It gives them pain to look on what was once their happiness. They cannot keep up their interest in the things that this superior race openly despises. Their little games and dances look mean and inferior compared with, to them, the imposing celebrations of the white men. Their interest has died out in them, as it has with everything

else that they most enjoyed and gloried in. A sense of their inferiority meets them at every turn. They are discouraged, disheartened, broken-spirited. The old fire will not come back in their veins at the bidding of any of the things that used to call it up, or if it does, the sight of a white man will quench it again. Is it to be wondered at that they do not display much activity or life? Is it to be wondered at that they appear lazy and spiritless?

"What use, what use is it?" they say, "for the poor Indian to try to do anything? Everything we do in the presence of white men only brings up a fresh sense of shame. We were proud of our hills and our forests and our rivers; we were proud to tell our children these would some day be theirs; we were proud of our tribe; we were proud of each other; we were proud of our Mother Earth that gave us such bountiful harvests of food. We are ashamed of all these things now; we are ashamed to learn from the white devil that has come among us, that we do not own our beautiful woods and hills; we are ashamed that we have told our children that they should be theirs; we are ashamed of each other and of our tribe and of our pitiful rations of acorns and fish."

This is the reason that the Indians do not seem more active. This is the reason that the Indians around the railroad stations and the settled towns look so listless,

MARSHALL RADCLIFF.

Half-breed boy, McCloud River Indians, California.

lazy and dejected. The white man has not only consciously dispossessed them of their lands and their inheritance, which was bad enough, but he has unconsciously robbed them of everything that made life dear to them. He has poisoned all their fountains of happiness. He has changed their sweet things of life into wormwood and gall. He has robbed them of their pride, their ambition and their manhood. He has taken, so to speak, the very marrow out of their lives, and the life that is left them is a burden, a bondage and a disgrace. These things account to some extent for what the white man calls the Indian's laziness.

SALMO.

A Camp on the Chickahominy.

WANTING an outing that would be new, pleasant, and not too far from home, yet health-giving, we decided on a tenting trip for a short season. This had been planned, talked of, and the larder filled so many times on paper, it was with very little trouble we laid in a stock of provisions we thought suitable; and the tent, set up in dreams so often, was actually bought, and the day soon came when we were ready to start. I must admit there were several return trips after the door was locked and a slight nervousness as to just how this thing would turn out.

Living in the city of Richmond, we, by happy chance, selected the historic Chickahominy Swamp for our camping ground. We had gone a few days before to be sure of a satisfactory site, and to obtain permission from the owner, which was given gladly. The place was high, dry and on the river bank, among grand old pines that sung and sighed until every sense was soothed and rested. It was a small party with small experience that left the C. & O. station that hot day in June. There was our friend Les, Tad our boy, W. and myself.

The ride on the train of about an hour was of no special interest, for the country is flat, and only the delightful freshness of the long tracts of woodland saves it from being most commonplace. Reaching Providence Forge, we alighted and found ourselves for once interesting to outsiders. The darkies grinned when they heard our plans, and the whites, however humble, were too polite to imply by any word they thought we were crazy, but they had not perfect command of the expression of their faces. After considerable talking we secured the services of a young black giant, who, placing the bag in which the

tent was packed with some cooking utensils on his head, a grip in one hand and a basket in the other, started off briskly for the "Reach," which was our destination.

It was hot even at 4 o'clock, and the four dozen eggs I carried increased steadily in weight, until each weighed about a pound at a rough guess. But the rest of the party were well loaded, so there was nothing to do but go on.

It was fully an hour before we came to the beautiful Sycamore Spring plantation, and filed down an ideal shady path to get a drink of the delicious water that gushed and gurgled from the side of the bank. To our right was the old deserted mansion house and one cabin standing, that occupied by the last of the old servants, Aunt Venie. But there was too much to be done to stop for investigating that night.

A short walk brought us to our camp ground, and a more lovely spot it has never been my pleasure to look on. It was a large cleared space, about 50 ft. from the river, which I am sure nature intended for a camp, and we were the first to discover the secret in all these ages! We unloaded and rested for a few minutes, trying to take it all in and getting delightful breaths of piny odors, and realize that this was actually to be our home for a few days.

We were soon at work. W. and Les hunting tent poles, while Tad and I unpacked the things that would be first needed, because usually those are left until the last, and until every package has been ramsacked in desperation. In a surprisingly short time the tents were up and well pegged, then the two "big boys" started for firewood, while Tad and I filled pillow-slips with pine tags and carried pine tags into the tent until they were knee deep, and oh, the fragrance of that bed!

The air was beginning to get cool, and the rousing fire the boys made was very pleasant. I'm not sure the fire was made in strict accordance to woodcraft, but we thought it a success. There was a quiet, suppressed excitement when we began to get supper. It was an important event, and I did want to do my best, but just where and how to get kettles placed on those uncertain looking logs, was puzzling! Many suggestions were offered, and at last by the help of a stout pole with a knotty end, a tin bucket of water was safely landed to boil for coffee. When the coffee was made, of course we fried bacon, for whoever heard of a camp that didn't have fried bacon? It was not long before supper was ready, and we ate it by the light of the fire, and with the hearty appetite that is produced by such exercise as we had. Why is it that coffee drank from a tin cup, stirred with a tin spoon, and bacon taken from the pan just as we need it on our tin plates, tastes so much better than in our "civilized state"?

After supper was cleared away we were all tired enough to gather around the fire and rest. The usual story telling of such parties was omitted. It was so restful not to hear the clang, clang of the electric cars, and all the babble of the city! Such peace, such quiet it seemed we had never known, and we were content to listen to all the "woody" sounds that are music to the ears of one loving nature just for herself. There would be a splash of the fish, followed by the remark, "That must have been a big fellow," and then the hoot, hoot, h-o-o-t of an owl, which would always receive a friendly answer from the other side of the woods. But our first night was not ideal! Those owls just kept up those "hooting visits" all night, and everything was so strange and new, that Tad said "his eyes just would not go shut," and I think it was the same with the rest of the party.

Nevertheless, just as day was breaking the boys were all up, fixing their lines to have a try at the fish before breakfast, and it was only a try to, for they didn't even have a nibble.

The sun had not absorbed the glorious freshness of the woods when we finished our breakfast, and this was the beginning of five happy, free days; and what an immense amount of enjoyment we crowded into them!

The fishing proved to be very good, though the first day's work was not encouraging, and we could take but little consolation from the native who tried to comfort us with, "If thar ain't no fesh in the river cetch, cose, you can't cetch no fesh." But we were reasonably sure there were "fesh to cetch," and "cetch" them we did before our outing was over.

At the ford it was a decided novelty to watch the teams come through the woods away across the river, with cries of "Whoa, whoa, sur," or a funny looking cart pulled by an ox, drive slowly down the steep bank, and then plunge in, water to the hubs and wade carefully across. But if they were new sights to us we afforded all that came near enough to our camp quite as much diversion.

Then there were walks to the spring and long talks with Aunt Venie, who told us many interesting tales of when Marse Edward brought them from Richmond during the war out to the plantation, and of Miss Car-line's marriage; and then she pointed out Miss Car-line's grave in the old family burying ground, near which we were sitting, now a wild growth of blush roses and honeysuckle. Just across the lane a short distance were the bodies of all the darkies who had died in Marse Edward's service, and it was with pride she told us, she "spect fo' long she be layin' thar her own self."

One never-to-be-forgotten night I was wakened by a distant growl of thunder, and then the lightning flashed and danced about in a decided business-like way. For a minute I was scared. Would the tent hold good its promise of being water-tight? Would there be any tent at all? For the wind was surely rising, and might carry it away. This and many more things rushed through my mind, among which was, would there be any dry wood to get breakfast with?

I aroused W., who, after listening to the wind, decided there was no time to lose, and the big rubber must be put over the tent. "Was I afraid to go out with him and help?" No, indeed! I just wanted a chance to get out and see how everything looked. We called Les to prepare himself, and we soon had the rubber cloth securely fastened.

But the sight was awful in its grandeur! The great trees swayed and bowed as though they would snap off, the sky one great mass of inky black, and the lightning darting forked tongues, showed us the river, wind-whipped to a foam, roaring and rushing, and at last there came howling blasts of wind. Never before had the

* The following notes refer particularly to the McCloud River Indians of the Sierra Nevada foothills of northern California.

loneliness of the place and our helplessness so impressed me. But the rain, which we had expected to come in torrents, was only a mild shower, which was almost dried from the bushes by the time we were ready to start for the ford.

The long rambles through the woods, finding many curious flowers and plants, mosses odd and lovely and specimens of wild cactus, with gorgeous pink and yellow blossoms, was one of my chief pleasures. Often on the soft road near our tent, we would see tracks of deer, but we had no sight of one, yet it showed the possibilities of the swamp in the game season.

But now our time was up, and all too soon we must go back to the city, yet so strengthened and refreshed for this brief sojourn with mother nature.

The tents were packed and the tin "chinaware" stored in the empty provision baskets, and we awaited only our former assistant to come to help us with the baggage. At the river and the spot where our canvas home had been for the past five days each one of us resolved that though this was our first, it should not be the last trip of this sort. For if one wants genuine rest, pleasure and enjoyment, I know of no place where all are better combined than among the grand old pines and cypresses of the Chickahominy.

ANNIE McD. WHEELER.

Types of Sportsmen.—III.

Editor Forest and Stream:

When you and I were together a while ago and chatting about men and their likings for the pleasures of the fields and streams, and you suggested that we consider types of sportsmen, I thought if I spoke of a schoolboy that it was the beginning of the end, yet it has since occurred to me that I did not go back far enough, and if now I write you of mine that was and of myself, and in so doing I possibly incur the ridicule of stony-hearted readers (if you choose to publish these lines) I cannot help it. If it meets no other eyes than yours, let it pass as an appeal to you personally for sympathy, and if I read your face aright and understand the kindly look in the eyes back of your spectacles, you will grant the appeal and not cast it and myself aside. It may be that there are some among your readers (and I think there must be) who have known sorrow of a like kind, and have had the same yearnings and desires, and can say with me, "'Tis better to have loved and lost than never to have loved at all."

My reference is to a little fellow who was taken from me many years ago—my little boy. He whom I had planned so much for, he whom I had hoped to take into the green fields in a far different way. They told me then, and they tell me now, that it is all for the best, but I could not understand it then, and I cannot now so understand it, and I'm waiting to see his little face watching from the windows of his celestial home for my homecoming as he so watched from his earthly house. Then again will his dimpled hands go up and his little voice repeat, "Papa, come," and Peter cannot say him nay. He was little and nearly two years old, but he knew more about me than I knew of myself, and when I held him on my knee and talked to him about the singing birds and told him how in years to come we would go out into the fields with them, I believe he understood. When I took my gun from its place and showed it to him, he would say, "Ope, ope," and as his little eyes peeped through the glistening barrels and his laugh rang through the house, I was the happiest man in the world. When I tried to wind the fish line upon its reel he tried to help me, and his efforts snarled the silk into a more confused pattern than that of the carpet, and I would go down to his level on the floor and we would put our heads together to study the problem. The artificial trout and bass flies were his especial delight, and he saw the good points and felt them too. I had thought to buy a little gun for him just as soon as he could carry it, and his little shoulder stand the recoil, and often had I looked into the Broadway gun store windows thinking of the purchase. Sundays, when his mother and sister were off to church and left me to care for him, how well I did it. Before they were fairly around the corner we played fishing. Is Sunday fishing of that kind wrong? In later years, when on some lake or beside some stream I wished that he might be with me that I could row him about or carry him in my arms across brooks or bad places; when lying on blankets and balsam branches in the North Woods, I have looked up to the stars wondering where among them he might be, and wishing that I might call him to myself. The smoke from the campfire should not touch him, no chilly wind should blow upon him; I would rap him in my blanket, fold my arms about him and keep awake that he might sleep in safety.

Yet it is not to be so. All that I have of him is a print of his moist little thumb on the inner cap of my watch case, a picture and a remembrance. His mother has his playthings, his little clothes, a pair of tiny bronze shoes wrinkled about the ankles and scarred in places where and when he walked on his uppers. I found them one Sabbath afternoon tucked away with ribbons and perfume, and they are a bond more binding than the minister's "I pronounce you husband and wife." He had a slight cold, we thought, and while away that day at my employment a reply came to my message, "There is no change." Returning at night I missed his face at the window, and as I entered the house they told me our little boy was dying. Can you know what that meant to me? His first and last words were "Papa." The doctors went out and desolation came in. The gentle spirit had gone, and the still little body was ours to care for but for a few hours longer. My pen will not obey further. The clips of my glasses will not hold when wet, my collar hurts my throat, and I have no more to tell.

W. W. HASTINGS.

A story is told of a Chicago commission game dealer that a man who had two barrels of prairie chickens out of season sent them to him, billing them as rabbits. He sold the birds at a big price, but returned the shipper the price of rabbits at 60 cents a dozen. The fellow kicked, but the dealer told him that he had sold the rabbits without looking to see what they were, as they were billed as rabbits, and refused to pay only for rabbits.

A Regimental Heirloom.

IN view of the strong ties binding together the Anglo-Saxon brotherhood on both sides of the Atlantic, and as of the American army it may now be said, as of their brothers in the British army, they can "go anywhere and do anything," it may not be out of place, in the FOREST AND STREAM, to give a brief sketch of the history of one of our Queen's marching regiments, the early home of the writer, leading up to a sporting incident closely connected with its unwritten history; for attention to sports and pastimes of a military force is a not unimportant part of preparation for active service. The regiment in question, now termed the East Yorkshire, has had many changes in name and station, in peace and in war, since it was raised in 1685, at the time of Monmouth's rebellion.

Its first active service was in 1690, when it was said by an officer, "We pursued them (the enemy) till we lost them in a fog, when they seemed like people received up into the clouds."

In 1708 the regiment was engaged in driving the French from their position at Oudenorde. "The (French) army was nearly destroyed, but was preserved from complete annihilation by the darkness of the night."

In 1709 it again took the field, and joined the force which invested Tournay. "The citadel of Tournay was celebrated for the multiplicity of its underground works, and the approaches were carried on by sinking pits and excavating subterranean passages to the enemy's casemates and mines."

Toward the end of 1740 the regiment embarked for Jamaica, and the following year it was employed on an expedition to Carthage, in South America. In 1741 it

was rechristened after we parted from her, in order that she might not be identified, her breakdown and our grievances having been brought before Parliament. We were so long lost sight of and were so much over time, that we were given up and included in the long list of hapless vessels lost at sea.

During the stay of the regiment in that home of the tourist and sportsman, Fredericton, the following incident occurred. Of the citizen of Fredericton it is well said by your correspondent, Mr. Risteen, "The tranquil river flowing by his door is a mirror of his mind. He is content with his lot, for, if he is secure from sudden attacks of affluence, he is equally safe from the withering disaster that comes from reckless speculation. He is liberal in thought, conservative in action."

At this desirable station the officers sat round the historic, well-polished mess table one winter's evening. The well-worn after-dinner stories, collected in the four quarters of the globe, had been reproduced; and sport in all its branches all the world over had, as usual, been resorted to as a topic of conversation, when the colonel, anxious that a long-felt want, his special fad, should be supplied before he retired from the command, suggested that a much-needed handsome centerpiece for the mess table should as soon as possible be ordered from London, its character based upon a sporting scene, depicted in silver. This met with the approval of all, old and young, and all decided that a North American winter scene would be most suitable.

Two keen sportsmen, D. and F., therefore were detailed for this welcome duty, to proceed forthwith to the best hunting grounds. Both had already won their spurs in green woods and on barrens, and both, at this distance of time, with additional experience, are now

THE CENTER-PIECE.

was encamped for a short time in the Island of Cuba. In 1758 it embarked for America and served in the attack on Louisbourg, a French settlement in the Gulf of St. Lawrence. In June, 1759, an expedition was organized against Quebec, and the regiment took part in it. The Heights of Abraham were gained by a night attack on Sept. 12, and a general engagement followed, when General Wolfe was killed in the hour of victory.

In 1782 a royal order was issued directing that each regiment should take a county name, and this regiment, heretofore the Fifteenth, received the territorial title of the "Yorkshire East Riding."

To those in this nineteenth century having any experience of the "natural thinness of the hair," it may be of interest to learn from a regimental order of this period (1782): "The hair should be turned up behind on a comb and loosely platted, with a black riband or tape in a bow-knot at the tie, which should never be permitted to be made too close to the head, as such a practice cuts the hair, which should be encouraged by every means to be as thick and full as possible. When, from the natural thinness of the hair, it is not sufficient, a false plat must be added. As nothing promotes the growth of hair more than frequent combing, the soldiers should be enjoined to accustom themselves to do so morning and night. It will be of infinite consequence to the improvement of their hair to permit them to appear at morning roll calling with their hair only tied, and hanging down the back."

Another subject of interest, the "whirligig of time" being nowadays, on occasion, brought seriously to our notice, was the form of punishment of soldiers of that period (1786)—not a time of over-civilization: "A common punishment for offenders among the followers of an army, when martial law prevailed, was the 'whirligig.' This was a circular wooden cage, with many apertures, which turned on a pivot, and whirled round with such velocity that the delinquent inside it soon became extremely sick."

Without following the regimental drum in peace and in war during the past century, the records bring us to January, 1862, when the regiment embarked for St. John, N. B., in the hired transport Adelaide, which encountered violent gales and was nearly lost. The ship

considered authorities in all that concerns rod and gun.

Two well-known skilled Indians—Chief Gabe and Sabatis—were selected to assist in "fetching venison" on this important service. In the case of these experienced sportsmen—red men and white—it required no reference to Lord Wolseley's "Soldier's Pocket Book" for instructions in the bivouac, nor to "Clery's Minor Tactics" as to the mode of action in conducting reconnoitering patrols, and in preparing and carrying out an attack upon moose and caribou.

The selected ground, too, for the tactical operations in question was all that could be desired—Gaspereaux barrens—grounds never—well, hardly ever—drawn blank. But man proposes!

I have lately, after a brief sketch of "blank days," sung the praises, in FOREST AND STREAM, of "Red Letter Days"—which of these were our "missionary sportsmen" destined to have allotted to them?

Day after day, alas, for many days in succession, it was a case of one unending blank! Of fresh tracks there were enough. Of hope there was enough. Of skill there was enough. Of moose and caribou—nil. At last, when hope had been nearly exhausted, when even fresh tracks had not been seen for many days; when nothing apparently was left but the final resolve to return, crestfallen and dejected, and to give an account, a sad account, of their stewardship, once more to take up the daily routine of barrack life, with the ever-pressing thought of the utter failure of the expedition; suddenly a bright idea flashed in the mind of the red man chief—Gabriel Sacobie—as he awakened from a long and disturbed sleep, "We have not tried that 'pocket' in barren No. 1, near Pleasant Brook. Game we get this day. I dream of many caribou."

There was joy in camp that morning. A general inspection, for the hundredth time, of rifles and ammunition. Breakfast was a veritable feast. Belts were tightened, snowshoes fastened with more than ordinary care, and with springy steps the reconnoitering party directed their course toward Pleasant Brook. The morning walk is perfection; the air we breathe is nectar; mile after mile is passed in rapid succession. And here is Pleasant Brook; and here, yes here, are fresh tracks of a large herd of caribou, with, happily, a breeze springing up in the required direction. There is no lengthened halt, every-

body's mind is made up how to make the "cast," how to bring guns and gunners to the supreme moment of action.

There was some pretty stalking; some unexpected delay. "Rome was not built in a day." Patience—already tested—was now required as a virtue. Well may the quarry be called Rangifer caribou; their range is great. But here, at last, is a line of fresh beds in snow and moss; here are the well-known signs of browsing, and there, that's nothing more nor less than the antlers of a fine stag, showing clearly on the sky line, over the brow of a not distant mound. "They're off!" "Yes, they're off!" the stag with the antlers leading in a series of bounds. A well-directed shot from the rifle of one brings him down, as fine a specimen of the caribou as he had previously, or has since, shot, and it was one of very many. This was followed by many succeeding shots, by many succeeding bounds on the part of the quarry: by many devices on the part of the gunners to aim and fire with effect; with the final result of as many caribou as we had planned to take, lying conspicuously on the "fighting line" in the crisp snow.

There was well-founded joy in camp that night that the apparent failure had been changed to success; and there was fresh joy the following day when the colonel welcomed the successful sportsmen to the barrack grounds, where the enclosed photograph—historic scene—was taken, from which was engraved the regimental centerpiece, an heirloom that accompanies this splendid regiment, the East Yorkshire, in its many wanderings in the empire of the Good Queen—an empire upon which the sun never sets.

FREDERICTON, New Brunswick.

MIC MAC.

Woman and Field Sports.

I HAVE often thought that it was a great pity that our wives and sisters and daughters did not indulge in outdoor sports more. They would soon learn to love them, and derive health and happiness from them. There is no reason why they should be debarred. If they could handle the revolver, rifle and shotgun with accuracy it would be something they should be proud of and one from which they would derive a great deal of pleasant and healthy exercise; and such knowledge might sometime be of great service to them, and would tend to give them more self-confidence. A woman who can pull an oar, cast a fly and land the wary trout, or bring to grass the whirring partridge or the swift-flying duck, has an accomplishment she should be proud of. She would enjoy the rambles through the stubble with dog and gun, or the excursions on the lakes with rod and reel, or the camp-fire and tent life in the woods, and find in them the much needed fresh air and exercise.

No doubt some old crusty sportsman will say that camp is no place for a lady. Well, of course that depends on the camp and its members. A camp that is not fit for your wife and children is not fit for you. A good many would-be sportsmen's idea is that a camp hunt means a grand drunk. Now, it does seem to me that if that was my idea, instead of going so far and spending so much, I would stay close by some good bar till I was completely satisfied or disgusted.

Take the women and children into camp. It will be all the purer for their presence; it will give you pleasure to see them happy and growing strong and healthier. And with the roses blooming on the wan cheeks and the bright sparkle in their eyes, denoting good humor and health, you will also note a lessening of the doctors visits and in your drug bills.

C. L. BRADLEY.

TENNESSEE.

Another Word in Appreciation.

Editor Forest and Stream:

In recent years many beautiful things have appeared in your columns, but none that have appealed more strongly to me than the recent article by Mr. W. W. Hastings entitled, "Types of Sportsmen.—I." Many years I have lived a "far cry" from the old homestead, and as I settled down in my den for a pleasant hour with FOREST AND STREAM, I was strangely moved when my eye fell upon the article I have mentioned. I was carried back many years to scenes to "memory dear." The streams and woods that caused me the loss of so many lessons, familiar faces of dear, dear friends who long ago passed "beneath that low, green tent whose curtain never outward swings," all seem present before me. Green is the memory of a trip home on a shutter, after having emptied father's gun of gin. of hornet's nest and blasting powder, after having been many times admonished not to touch it. I travel again the well-known forest ways with dog and gun and faithful friends; we are again setting a line of traps and watching for the first breaking of the ice in the trout streams; again we gather the first wild flowers. The time passes unheeded until the fall of the back log in the grate brings me back again to the present.

Blest be memory, which takes us back again to boyhood days.

C. J. HALPEN.

HAVERHILL, Mass.

In Appalachian America.

No one who has ridden, as I have, through the silent lengths of that great region, can fail to have his imagination touched by what he has seen—the almost limitless forests lying there untouched upon the long slopes of the towering hills, as if they had been there keeping their counsel and holding their secrets ever since the creation; and here and there in the little clearings the houses of a secluded people, as reticent as the hills about them, slow to speak, their eyes watchful, holding back the secrets of their quiet life.—Prof. Woodrow Wilson in the Bevan Quarterly.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Natural History.

Bob White in Town.

HUDSON, N. Y., May 15.—Editor Forest and Stream: On my way to business at 8 o'clock this morning, and while passing the grounds surrounding the Presbyterian church, I heard a familiar whistle, one that will make a sportsman stop short or change his gait to a tip-toe and make him peep in every nook and corner to find where it comes from. I was not long in climbing over the fence enclosing the ground, and there I saw a pair of quail, as natural as could be, and apparently as much at home as they would have been in some field miles from civilization, instead of in the heart of the town. I ran for the camera, but before I could get back again and near enough, one flew on to the church, the other out into the street, and lit on the sidewalk in front of a grocery store. I enclose the snap-shot I caught of it on the sidewalk.

While I was looking after this pair a covey of fifteen were located in the park in front of the court house, and there they were undisturbed for some time, until some boys coming along, thought they were little chickens, and tried to catch them, when they flew to a neigh-

A WILD QUAIL IN CITY STREETS.

Photo by Mr. G. Hills.

bor's grounds. They were not at all wild, and I think must have been released somewhere near here within a day or two, as we have not known of so large a covey anywhere in this vicinity. If this should come to the notice of anyone in this county or the adjacent counties who has released quail within a week, I would be pleased to hear from him.

I have just heard of the death of one of the quail. A friend's cat caught it on his lawn.

G. HILLS.

The Brush Deer.

C. macrotis, var. *virgultus*.

Range: northwestern Minnesota and southeastern Kewatin, Manitoba; Rainy River, Lake of the Woods, Red Lake and Roseau region.

Editor Forest and Stream:

I am happy to summarize for your consideration my protracted investigations in northwestern Minnesota during the eleven years 1880-91 of a variety of black-tailed deer which occupy a limited area on both sides of the international boundary and are locally known as brush deer and jumping deer. The last describes a habit and the first his habitat, and is therefore the most appropriate as a distinctive appellation. I have arbitrarily designated it as *Cariacus virgultus*. In the early years of the decade above mentioned they were tolerably abundant, and a trio of hunters headed by Dean Benson secured as many as five in three days in December of 1882, and brought the carcasses into the town of Hallock, which was then, as now, the county seat of Kittson county, Minn. They stood on view for a number of days, and at last a land-looker from Pennsylvania, whose name and residence I have forgotten, bought the largest and finest buck specimen and shipped it away for mounting. It is barely possible that his address can even now be obtained from Horace Sutton, merchant, of Gadis, Roseau county, Minn. [Roseau was segregated from Kittson some ten years ago as a new county.] The balance of the deer were cut up for meat and the skins were sold as ordinary pelts for \$1.50 apiece. It is to be deprecated that someone was not sufficiently alert in the interest of science to take advantage of an opportunity which never could be bettered to secure male and female specimens. Later on I made special endeavors to do so, and in 1890 I obtained a permit from the State for one James Fullerton to shoot brush deer out of season for the State University and the Smithsonian Institution. He procured a doe, which he duly shipped to Minneapolis, but not receiving the pay which he expected, wrote me an order on Henry F. Nachtrich, professor of animal biology at the university with bill for the deer, which I have now. I presume the specimen is still in its collection. Some two years previous to this, Mr. L. Booker, president of a private bank in Pembina, N. D., had a fine mounted male specimen at his residence. I am not aware of the existence of any but the three mentioned. My visits to Hallock were annual and confined to the closed season for deer, and Fullerton moved to Wyoming not long after, so that his efforts ceased there.

To summarize and differentiate, I find this brush deer so unique in many essential characteristics as to startle zoologists who had previously recognized or been cognizant of only the accepted varieties of the *Cervidae*. As far as I can learn from Chiefs Koopenar and Mikenok, of the Roseau Indian Reservation, and from the best

white local hunters, they are scarcely known beyond the tract of country which lies between the Rainy River on the east and the Red River of the North on the west, and embraces an area of some 10,000 square miles. The Red Lake country and the Lake of the Woods define its southern and northern limits respectively. There is a strip of prairie about twenty miles wide skirting its western border along the Red River bottom, which is fully occupied by farmers, and some settlers have pushed well into the timber to the eastward; but until the miners and prospectors came in numbers there was no interior population except a few Indians. I wrote Chicago Field from Minnesota in 1884:

"It is among the brush which fringes the edge of this timber and separates it from the prairie that the assumed variety of deer in question has hitherto been found and killed by local hunters. They are known as brush deer, from their being found in the brush, to which their winter coat very nearly assimilates in color, as well as from the shape of their tails, which are short, thick and bristling, like brushes used in cleaning bottles. They are not familiar to hunters from other sections and are the subjects of much curiosity and comment therefrom. The common red deer (white-tail) is rare in this immediate vicinity.

"I have taken especial pains to note the markings and structural characteristics of this deer, and to make measurements; and having had five specimens, of both sexes and different ages, under inspection at one time, and found them all to agree in general features, I have been able to reach conclusions which might not be justified by a single specimen. One big buck (the largest) stood 3ft. 5in. high at the shoulder and measured 5ft. in length from tip of nose to end of tail; girth, 4ft. around the body and 2ft. around the neck, which was short and thick-set. Body hair, dark gray, profusely sprinkled with long black and white hairs; forehead, broad and protruding, and black to the eyes; face and throat, light gray, shading to jet black on the breast and over the entire belly; tip of nose, black; ears, black; rump, light gray; tail, 6in. long, stubby, the upper half pure white, the lower half jet black; hocks, tawny; hoofs, 3in. long; antlers, comparatively small, short and very symmetrical, with seven prongs to each. Weight of animal on the hoof, 300lbs.

"The tail is somewhat similar to that of *C. macrotis*, but of uniform thickness its whole length, while that of its congener is shaped more like a mule's. The markings are different, and so are its habits. Its antlers are very much smaller and its weight less. As to the true black-tails of the continental divide and the Pacific Coast, they are not nearly so chunky, and their general coloration and markings are also different. The coat is several shades lighter at the same season, and their throats and bellies are invariably white. Col. E. S. Bond, of Chicago, examined several carload consignments with me, and all were white. Their tails are much longer, broader, flatter, more spindling, with a small black tuft on the end about one-fifth of the length. Horns are much larger, more spreading, and more scraggy. In short, there are scarcely three breeds of cattle to be found so strikingly dissimilar in their appearance. When startled, the brush deer gather their forefeet together and seem to jump rather than bound, a habit which makes them hard to hit. They are invariably hunted from the saddle with a short rifle. Buckshot are no good, as the brush is too dense. Long shots are the rule. Two hunters in partnership succeed the best, for obvious reasons. Tracking is the method in favor, but deer are often jumped from the brush. Without horses very little ground could be covered without fatigue, and it would be a task to pack dead meat through deep snows for any distance to a camp."

Synchronous reference was made to this discovery of the brush deer in the St. Paul Pioneer Press of Feb. 7, 1884, which reported as follows:

"Mr. Hallock has made the interesting discovery, which Spencer Baird accepts as gratifyingly important, that the brush-tail deer is found in Minnesota. Mr. Hallock's residence in the northern part of this State has given him advantages for observation which led to this addition to what is known of the deer species in the Northwest."

From Indian Agent Grim, at Dominion City, Manitoba, I have just learned that the Indian name for the species of brush deer which I have named *virgultus* would be "Muck-a-tay-wan-wish." This in distinction from the class or genus of deer known as "jumping deer," as distinguished from others which trot, or run. The Indian designation for jumping deer in general is Wa-wash-kay-oh.

CHARLES HALLOCK.

Animal Cemeteries.

Editor Forest and Stream:

In the story of one of my trips to the woods, printed in yours of Jan. 14 and 21 last, I mentioned that my guide showed me a place where he said the caribou came to shed their horns, and that he went ashore and found a pair.

The idea of the animals seeking a definite place for this purpose was quite new to me, but lately the efficient superintendent of game and fisheries at Quebec, L. Z. Joncas, Esq., has told me that they do frequent such places, and that this habit was quite well known to him. He knew of many (and mentioned several) places where horns could almost certainly be found at any time. And not only do they go to shed their horns, but they go there to die. These places are known as cemeteries, and whole skeletons are occasionally found. This, however, would be rare, as the bones would usually be torn apart and scattered by bears and other carnivore.

Mr. Joncas instanced the case of a gentleman going to a certain region for geological exploration, who asked for a permit to shoot a moose out of season in order to get a good pair of antlers. He was told that by diverging a little from his route he might reach a place where he would find plenty of them. He did so and secured five excellent specimens.

This may be a very old story to thousands of your readers, but as I had never heard or read of it before I made a note of what seemed to me an interesting point. It would account for one so rarely finding bones or horns lying about loose in the woods.

G. DE MONTAUBAN.

QUEBEC

Migrations at New Orleans.

IN the previous account in *FOREST AND STREAM* of April 29, of the migrations here this spring, it was stated that on April 20 the weather was very summery, and that unless there should be rain and a spell of brisk weather there would be no visible evidence at least of any further migration.

But there is no depending on the birds; one begins to think there is no use predicating anything definite about them. The rain did come, it is true, but on this occasion the birds came before the rain. The very day the other notes were mailed, the open meadows of Audubon Park were lively with the ditties of the black-throated bunting. This species had not been present since 1895, the cause of its absence being unknown to me; by April 22 the birds became as abundant as they were at any time. On the 20th the barn swallows were really abundant for the first time. Another cuckoo was heard, and humming-birds abounded. The rain came that evening. The next day broke in a heavy rainstorm, and though the storm ended in the forenoon, the sky remained cloudy, and there was a good shower before sunset. The new tender foliage of the oaks, hackberries and pecan trees, on the retired and suburban streets near Audubon Park being now freshened by one of our typical warm, soaking spring rains, and being insect laden, doubtless attracted many birds. The last myrtle warbler in full plumage and singing in a desultory way, as these late migrants usually do, was noted. (The date of departure of the last myrtle warbler here is unusually regular; for former years it has been as follows: 1894, April 21; 1895, April 22; 1896, April 15; 1897, April 27; 1898, April 21. It will be seen from this that with the record for this year the date of departure has been April 21, three times; these notes are the joint records of Mr. Andrew Allison and myself.)

Worm-eating warblers were found rather commonly, moving about briskly and not often giving one a chance to see them well. This warbler is an uncommon one ordinarily about New Orleans. A flock of waxwings was observed the same day.

April 22.—More worm-eating warblers; one olive-backed thrush; yellow-billed cuckoos common.

The morning was stormy looking, but a brisk wind swept all traces of clouds away by noon; there was a sparkle and brightness in the air, and the wind was fresh but soft, coming from the south.

April 23.—The "most perfect" day of the season; sky dazzlingly bright, and air fresh and limpid. In a grove of young willows, blackberries and locusts, some rare transient birds were seen; the Blackburnian warbler and a pair of the blue-winged yellow warblers, also a transient of the yellow warbler. The last white-throated sparrow was seen.

We seemed to be enjoying a "second spring" at this time, but it was as ephemeral as it was delightful, and the next day ended this respite from our early summer.

From April 25 to May 7 or 8 there were growing indications of summer conditions, and the summer seemed fairly installed by the last of these dates.

Strange to say, however, no grasshopper sparrows were noted before May 9, when one was heard singing; this bird is ordinarily common in Audubon Park after the first week in April.

Two strange things were noted of the black-throated: on the night of April 28 about 10 o'clock, one was heard singing as loudly as in the day. I have never heard that this species is a night singer. The other notable thing was the finding of what was undoubtedly the nest of one of these birds, though all appeared to leave May 6 or 7 all the circumstances pointed to the buntings as the owners of the nest, which was rather compactly built, and contained two light blue eggs, when some one robbed it. The only other species that might have similar nesting habits is the indigo bird, and while this species was common a short time previous, none were present at this time, whereas the black-throats were all about.

April 25.—Savanna sparrows and hummingbirds exceedingly common. Many indigo buntings were present April 20-25.

April 25-28.—Light migrations nightly. Yellow-breasted chats were heard most frequently.

May 4.—Last Savanna sparrow.

We shall have a long wait now before the general fall migration sets in, though in the latter part of July the waders begin to return, and movements begin among some of the warblers and vireos and the swallows.

HENRY H. KOPMAN.

A Pennsylvania Putnam and a Wolf.

GETTYSBURG, Pa.—The last wolf seen or heard of in Adams county was killed by Thomas Goodman, an old hunter in the mountains northwest of Castletown. He saw the tracks in the snow, and following them to a den in the rocks, the hole being large enough for a man to crawl in on his hands and knees, he lit a pine-knot from a fire kindled for that purpose, and pushing his gun, a muzzle-loading rifle in front of him, entered the den. After going some distance he saw two bright spots some roft. ahead, and taking the rifle he shot for the space between the bright spots. After shooting he dropped the rifle and drew a large hunting knife in anticipation of an attack from the mate. But after waiting some time and not hearing anything, he moved on to the place where the bright spots had been, and found he had shot the wolf between the eyes, killing it instantly. He watched the den for several weeks after, but not seeing any others, he knew he had killed the last one in the South Mountains. This was about the year 1857. In size, it was about as large as a shepherd dog, a little longer in the legs and gray in color. This was the last wolf heard or seen in our county.

F. M. B.

An Opossum on his Dignity.

MILHURST, N. J., May 15.—Last Sunday while strolling through the fields in a lonely place, I saw a big possum out in an open grassy meadow leisurely coming toward me; and as I was then behind a clump of bushes, it didn't happen to see me. As soon as it got suitably near, I picked up a stick and ran out and hit it a number of light blows, which caused it to stop, and it then commenced

growling and bristling up, but not offering to move off. How I would like to have had some one present with a camera at the time.

Then the idea came to me that, as it kept headed toward me in a sideling way and kept the one position mostly, I would just make a rough sketch of the little varmint. So luckily, having a letter and a bit of a pencil I sat myself down in the grass within 5ft. of it and commenced sketching, while it kept up a continual snarling and growling, somewhat as a small dog would, at the same time humping its back and bristling up for all it was worth. As soon as it offered to change its position I would give it a gentle tap with the stick, when it would assume the sideling position again. Thus keeping it so for a short time, I managed to make the enclosed sketch.

I was never more amused in my life. The very idea of sitting flat in the grass on a bright, sunshiny day out in a meadow within 5ft. of a snarling and bristling possum and making a sketch of it! The whole affair was simply ludicrous.

Having made the drawing, and thanking the little animal for its kindness in keeping so reasonably quiet while having its picture taken, I bade it good-day, and resumed my strolling in one direction, and looking back a moment afterward, saw the fat marsupial awkwardly waddling off through the grass in another.

A. L. LYON.

Game Bag and Gun.

In the Rockies.—II.

(Continued from page 386.)

"A horse! A horse! My kingdom for a horse!"

ONWARD and upward our pack train traveled steadily throughout the long and laborious day; after another late start the following morning. Late that afternoon we came to an ideal camping place in a meadow beside a stream, and Chad, our guide, suggested making camp. But it still lacked a couple of hours until dark, and being anxious to reach our journey's end, we insisted upon pushing on. For a short distance we followed the tortuous course of the stream, now finding a precarious footing upon its crumbling banks, and now stemming its swift current. Then we were compelled to abandon it by the beetling bluffs, which shut in upon it, and struck up the mountain side. Our guide and packer were loath to leave it, but Dan and I were insistent.

We wound along well worn game trails, zigzagging back and forth upon the precipitous mountain side, until we reached the summit of the ridge, where we found a highway, in the literal sense, which we traveled for many miles, with our horizon widened to limits inconceivable by the man who has never breathed the high thin atmosphere of those dizzy heights. The distant peaks cut the sky line sharp and clear as a cameo, and upon their scarp sides we could see each stunted bush that clung to the savage slope, each rock with rigorous distinctness of outline.

The sun lingers long and lovingly upon the mountain tops, and before it had set for us on that high ridge, night had already come to the cañons below us. Disliking to climb down that mountain side only to have to climb back up it again in the morning, we pressed on hoping to come to the end of the ridge, but at last the shadows of night gloomed about us, and we saw we would have to undertake the descent, or camp for the night among the bleak rocks without wood for fuel, pasture for our horses, or water for either them or ourselves. Then we heartily berated ourselves for not listening to our guide's advice earlier.

We were blundering down the steep and savage slope in the dark. I was in advance with Chad, the pack horses following us, and behind them urging on, were Dan, and "Toad," the packer. Half-way down the mountain side grew steeper, and we dismounted, leading our horses, and carefully feeling our way.

Suddenly our horses careened madly backward with a frightened snort. I clung to the bridle rein, and was jerked off my feet. Within a few feet of us in the darkness sounded a loud, startled "hough," and in the direction it came from there was a scrambling in the bushes. A strong, half-human odor assailed our nostrils. We had walked upon a bear, who had probably mistook us for a band of elk coming down the mountain side, and who, upon discovering his mistake, humped himself off as badly frightened as were our horses. In an instant everyone of them had broken loose and stampeded, and we were left alone on the side of the steep mountain in the dark, and without even our rifles, which were in their boots on the saddles.

We sat down and listened to the sounds of the stampede dying away in the distance, and pursued by the frantic guide and packer, who yelled and raved far in the rear. When they returned empty handed, we took an inventory, and found that we mustered one revolver without any ammunition for it, some flies and fishhooks, and a hunting knife apiece—not a very consoling outlook for four hungry hunters adrift in the wilds a hundred miles from the nearest habitation.

The moon was coming up, and by the aid of its pale light we got down off the mountain without further accident, and built a big fire of sage brush and aspen boughs beside the stream, supping sumptuously upon cold water. While coming down an incident happened that illustrated what a practical woodsman our guide was. Chad, who was in the lead, suddenly halted us with an exclamation, and while we were fumbling for matches, informed us that there were Indians about—his foot had struck the impress of an Indian's moccasined foot in a soft spot. Striking a match we saw it there plainly outlined, but the moment it gleamed under the light he gave an exclamation of disgust, berating himself for not having thought of the bear we had met higher up. A bear's hind foot leaves an imprint almost identical to that of an Indian, and this it was.

Needless to say, we slept little that night, but shivered around the fire, the air biting like a bulldog, and our faces burned to a crisp, while chills were tobogganing up and down our spines. With the first streak of day we were off, and trailed the horses until noon before we found

them. Having learned the wisdom of making haste slowly, we went into camp right there, and after a hearty meal Dan went to sleep. I stretched out to do the same, but got interested in watching Chad, who was a past grand master in the art of fly-fishing.

In front of our camp the stream swept by swiftly though sullenly, for the channel was deep. Parting the willows Chad made a cast, the fly flitted over the surface, there was a shimmer, a gleam of light flashing out from under the steep shelving bank, a swirl, a dash down stream, and at the touch of the steel a speckled beauty flashed into full view. The rod quivered and bent, the reel sang, and again and again the surface seethed as his sinewy form shot into view, until at last, completely spent, the game fish floated feebly up on its mottled side.

Then I took off my hat—not in deference, but in search of a black gnat, the fly that Chad had found successful. No morocco-bound fly-book bulges out the breast pocket of the angler for mountain trout. He who voyages through the Rockies on the hurricane deck of a cayuse discards all ephemeral refinements. I know full well that many a tale is told, many a recollection is written in the few pages of the fly-book—pages that no pen has ever marred—that friendliest of faces, and sweetest sylvan scenes, and sounds of running streams are imprisoned between its covers, and that each worn and ragged fly with its scars of honest battle, has a tale to tell of many triumphs. But for practical utility the old campaigner knows a fly-book worth two of that. It bulges out no pocket, it is never lost, or left in the bottom of the pack, but it is always with him, carried on his head. Around the crown of his soft slouch hat he winds a couple of long gut leaders, and there they stay until wanted. In the leather sweat band on the inside he sticks the point of the hooks and they are safe, shielded between the swat band and the felt. They are arranged around the circumference of the band, and the gut snells radiate toward the center like the spokes of a wagon wheel. They keep in better order than they would in any fly-book, and the wearer never knows they are there until he looks for them. I have worn a hat full of flies for six weeks, night and day, even sleeping in it, and found them always in fine order and available when wanted. You never know when you leave camp when you will get back or what you will want. Always carry a little bag of salt and a hat full of flies, and if you get lost you could subsist on trout even if your ammunition gave out. Many a morning have I hunted without success, and whiled away the middle of the day, when the game quits moving, fishing for the speckled beauties with a rod culled from some clump of alders.

I found the fly I wanted, and waded down to the foot of the riffle, whisking the fly as I went just to test the spring of the rod and to see that my wrist had not yet lost its cunning. Now for a good beginning. Where the curving stream sweeps against yon steep bank the water has a bluer tinge, a greater depth, and underneath that overhanging rock is a veritable den for some old seclusive savage to lay in wait, and watch for aught that might travel down the liquid highway past his lair. With 40ft. of line out I can barely reach it, but though the cast proves abortive it confirms my hopes. There was a line of light flitting through the water as if some spent sunbeam sought the depths. With greater care I cast again. Again that splendid rise. Eager to gain the prize, I strike, and by the shades of Walton lose him. For one fleeting instant the hook held, and then the pole straightened out, the line was lax, and the fish had felt the steel and was gone. Hoping against hope I cast the fly far below, and bring it skitting over the surface. That was a game fish. The sting of the hook seemed to merely rouse his wrath, and rushing from his lair he made sure work of the audacious insect. The upward rush carried him high above the surface, a glimpse of silver and gold, set with round ruby dots, a splash and the vision vanishes. But only for an instant. The weight of the fish's descent comes down upon the rod, and the hook, well mouthed, is driven home.

Without that fish I feel that life is not worth living. All considerations pale beside the desire to have him. Oh, for a stiffer rod and stouter tackle! The savage instinct mounts supreme. Long dormant, it seethes in the blood, the same thirst for conquest that thrilled our nomadic forefathers, hunters and fishermen all their days, to whom success meant food and life; failure, starvation and death. That instinct guides my hand while the lis-some rod bends in bowlike curves and my nerves vibrate to every motion of the fish, transmitted through the bamboo electrically.

At last the tension lessens. Fewer and feebler grow his rushes, and between them I draw a free breath. Succumbing only to complete exhaustion, incapable of another effort, the great trout is brought to land. I lay him gasping upon the green sward, full 2ft. of matchless coloring.

A footfall behind me, and the clanking of the camp kettles, and I turn to confront Toad, the packer, who has come down for a pail of water. He gazes admiringly upon the fish—not with the eye of an angler, but looking solely to its culinary properties. He swoops down upon it, and before it is through kicking it is in the frying pan.

Down the stream, as the shades of night steal out from the mountain side, I stumble over the slippery, rock-strewn bottom, battling with that world of waters, and escaping a ducking more through good luck than skill or strength. No trout streams on earth can compare with those of the Rocky Mountains. As limpid as liquid crystal, as swift as a mill-race throughout their length, as cold as the melting snow which feed them, it is no wonder that their tenants of the freehold are strong and quick and game. And then, they have the weight—weight which the fisher for fingerling brook trout wots not of. I have bearded both in their watery wilds, and know whereof I speak. I have heard the effete Eastern angler, who never saw a mountain trout, say, "Yes, they are larger, but then they are coarser, and not so game as our brook trout." It is a downright pleasure to see such a one tackle a big trout in a mountain torrent, and at one and the same time smash his tackle, and change his mind. No other rises more fiercely to the fly, or fights faster, or longer. And upon the table, in the opinion of epicureans, he yields place to neither fish nor flesh. But to appreciate him as he should be, you

should accompany me back to camp with your creel straining at its withes with the weight, and your appetite sharpened as only the mountain air can sharpen it.

At camp a wonderful transformation has taken place. Order has come out of the chaos, and everything is in its place. The wild spot which through countless centuries was unprofaned of man now wears a homelike aspect. The tents have been pitched, balsam boughs laid down 1 ft. deep, and the blankets spread upon them. The fire flames and crackles cheerily, and in the flickering light the aspens now reach out their white and ghostly arms, and now withdraw them. Night is at hand.

FRANCIS J. HAGAN.

[TO BE CONTINUED.]

CHICAGO AND THE WEST

The Supposed Flight of Wild Pigeons.

CHICAGO, Ill., May 20.—As a usual thing the average daily newspaper is an exceedingly untrustworthy source of information on matters pertaining to field sports or natural history. The average daily editor is always a very hurried man, and is sometimes a very ignorant man, so far as regards knowledge in the above lines, and once in a while he is a man deliberately seeking for a sensation, no matter how unfaithful that may be to facts. It would be difficult to say how many times there have appeared in the columns of the daily press more or less fabulous reports of imaginary flocks of wild pigeons, and indeed this is one of the staple items of "news" among correspondents in need of space money. When you see such an item in a newspaper, it will for the most part be safe to brand it as either deliberately untrue or grossly ignorant. It is easy to mistake a flock of blackbirds for a flock of pigeons under conditions of a certain cerebral excitation. Even a more deliberate attitude might lead one into supposing that he had seen a flock of passenger pigeons, when it reality he witnessed a flight of golden plover. For one reason or another we hear of flocks of wild pigeons, here, there and everywhere, and we read ingenious theories as to the present location of the great pigeon roosts in Central America, Africa, Australia or some other seaport country.

It is supposed by scientists that the wild pigeon is practically extinct in the United States. Scientists do not, however, claim this to be literally true, and it is without doubt true that a few specimens of this bird have been seen within the last few years. In an issue of the FOREST AND STREAM of last June, I gave the account of some gentlemen of Grand Rapids, Mich., who had on two separate occasions seen specimens of the wild pigeons at a recent date, and who cited the indisputable proof of mounted specimens of these birds which had been killed near Grand Rapids not long before the date above mentioned.

So much then, may be said for the accuracy of the statement that the wild pigeon is not extinct, and if there be a few individuals, it is at least not impossible that there may be a flock or flocks of these birds.

The truth of the Reedsburg, Wis., dispatch, reporting a large flock of pigeons at Lime Ridge, given in FOREST AND STREAM of May 20, has also been investigated by Mr. H. B. Jewell, of Wabasha, Minn., who wrote to the postmaster at Lime Ridge and received the following reply:

"LIME RIDGE, Wis., May 16.—Hon. H. B. Jewell.—Dear sir: The clipping you sent to hand. The pigeon story is getting quite large; nevertheless a part of it is so. There was a string, probably a mile long and single file. Now and then there would be an opening, and probably a hundred in each string. This is correct, as I can prove by the parties with me at the time.

"W. H. BRENZER, P. M."

Mr. Jewell says that the letter from the Lime Ridge postmaster is "certainly from headquarters," and he leaves the matter, as I must also, for the decision of the popular jury. There would certainly seem to be a very large element of truth in the dispatch. We have no right, scientific or otherwise, to brand as untrue any event because we have not seen it ourselves in the process of its happening. I should trust my informants at Grand Rapids absolutely in regard to wild pigeons, because they have grown up among them and have known them familiarly in the past. As much may be said for the old inhabitants of Wisconsin, where the bird was also known in countless numbers not many years ago. If this was a flight of wild pigeons, there is still mystery enough left regarding it. Where did the birds come from, and where did they go?

Singing Mouse No. 14.

Speaking of daily newspaper natural history, I believe I should be obliged to admit that, if I had first read in a daily newspaper of a singing mouse, I should probably have smiled in a superior way, and have thought that it was another case of opium dream. Yet not long ago I had very good proof of the accuracy of a statement in the New York Herald which mentioned a singing mouse that had been located in New York City. This item in the Herald calls out a letter from Mr. Charles H. Cragin, of Washington, D. C., who wrote to the Herald regarding a mouse or mice which he had heard to sing many years ago, and which he thought learned the trick from canary birds. Mr. Cragin's mouse is the fourteenth of which I have ever personally heard, and perhaps his comment may be not without interest as bearing on this curious little product of animate nature.

"About thirty years ago my father devoted some of his spare time to raising canary birds for pleasure, and one room in the back building of the old home was given up to this object. After he had gotten all of the pleasure out of this work that he desired, he gave the birds away, and the room, previously monopolized by the canaries, was thoroughly cleaned and used as a servant's bedroom.

"Shortly afterward we were very much surprised to hear noises through the house, resembling those made by the birds. After some patient watching on my part, I was soon rewarded by actually seeing a mouse sit up, like squirrels do, and sing or whistle—whichever one may call it—precisely as the canaries had done. These singers, or whistlers, continued to furnish us with their music for many months, and then it gradually subsided."

Got Two Turkeys.

Mr. and Mrs. Edward Kemeys, of Bryn Mawr,

Chicago, have hunted together in many parts of the West and South. Mrs. Kemeys has killed antelope and deer in Colorado and Texas, wild turkeys in the Indian Nations, and at least one bear in North Carolina. Mr. Kemeys years ago killed a great deal of big game. Nowadays they care most for wild turkeys. They have gone to all sorts of places after this royal bird, very often without success, and they would be only too glad to go to any region, no matter how distant, where they thought they would be sure of getting a wild turkey. This spring they heard that they could probably meet success near Brandon, Miss., and last March they made another turkey pilgrimage to a plantation not far from Brandon. Here they hunted patiently for a couple of weeks. The method employed was that of sitting in a blind and watching a bait. Several times they found the bait of corn eaten up in their absence, but they seemed doomed to disappointment, the only results for some days being a turkey hen which was killed by Mr. Kemeys. On the last day of their stay Mrs. Kemeys decided to go out for a final session at the blind. She had waited for more than an hour, and having given up all hope had violated all the canons of turkey hunting, coughing, moving about in the blind, etc. Yet at last, by chance, turning her eyes toward the bait, she saw a sudden vision of a giant gobbler standing with head erect, looking directly at the blind. An instant later he stooped and began to peck at the corn. Perhaps he heard the movement of the huntress as she turned the double barrel upon him, for again he stood at full height, a glorious apparition of the woods, this time just in time to receive the charge in the head and neck. Mrs. Kemeys says that when she came up and saw this great bird lying with outspread wings upon the ground, it seemed to her the most beautiful thing she had ever seen. All the prismatic colors in the plumage were shown fully in the bright sun which beat upon it, and so impressed was she with the beauty and consequence of her prize, that she instinctively called out exultantly at the top of her voice. Then she had the task of carrying the burden nearly a mile before she got assistance. I saw the skins of these two birds, which were mounted here in Chicago, and I must say that never did any plumage appear more beautiful. It is rarely that we hear of the killing of a wild turkey by any resident of this city, and the bird is so rare and so very shy that it may be well entitled as among the premier trophies of the American sportsman.

Acquired Territory.

Mr. F. H. Lord, general passenger agent of the Chicago Great Western Railroad, is just back from Minnesota, where his railroad has been annexing a new lot of territory. Mr. Lord tells me that the new railroad line will be called the Cannon Valley Division of the Chicago Great Western. It runs from Red Wing to Makato, Minn., and taps some good sporting country, for instance the famous bass water known as Madison Lake. As Mr. Lord is a devoted sportsman himself as occasion offers, it may be supposed that he will take a fatherly interest in this newly acquired territory.

Fell By the Wayside.

Mr. Percy F. Stone, of this city, has a summer cottage at Oconomowoc, Wis., near which place he was born and brought up. This week Mr. Stone was up at his cottage, and while there learned the facts of a little instance of law-breaking which he has brought to me. It would seem that Mr. Ernest W. Chubb, of Milwaukee, who sometimes writes in the sporting press over the name of Greenhead, has either through ignorance or intent broken the fish law of Wisconsin. Let us hope that the former motive is the real one. It is not right for any one to preach doctrine for others which he will not practice for himself. Mr. Stone handed me the following cutting of a dispatch which appeared in a Milwaukee journal of May 15:

"OCONOMOWOC, Wis., May 15.—Deputy Game Warden B. S. Young arrested two men yesterday forenoon on Silver Lake while in the act of catching green bass unlawfully. They were brought to Oconomowoc and this morning pleaded guilty and paid their fines, \$10 and costs. Ernest W. Chubb, one of the men, lives in Milwaukee, and is a correspondent for Sports Afield, a periodical devoted to the interests of sportsmen. He sometimes writes for other papers and magazines, always upholding the law and crying down the game wardens for not performing their duties. He advocated the law prohibiting spring shooting and favored the protection extended to fish. He is a great duck hunter and admires the wary green head, so much so that he chose the nom de plume Greenhead, when writing for magazines."

My informant tells me that Mr. Chubb and his companion were fishing in Mud Bay, a famous spawning ground of the black bass. They had taken seven bass when they were approached by the officers of the law. They threw these fish overboard, but five of them were dead and were picked up by the deputy warden and used as evidence. The men were fined something over \$13, and had their boat and tackle confiscated. I am very sorry to be obliged to chronicle such news.

Siberia Montana.

It is matter of great regret to me that I was out of town the day this week when my old bear hunting companion and friend, Noel Money, passed through en route West. I got his message too late to catch him here. The last time I heard of Noel he was in France, bound thence for Siberia. Then he came back to London, dodging Chicago very conscientiously. Now, without any warning, he flits by in the night and leaves only a hail and farewell to mark his going. For the benefit of many friends of this good sportsman and good fellow, I may say that his address, to-day at least, is Marysville, Montana. Should I ever catch him there will be an accounting. I want to know if he still wears the buckskin trousers that I coveted. And I want to say to him again that Capt. Bobo has been saving up for him a set of good bear tusks, and a pure white bear claw which he personally took off from the bear which bore it. I don't mind a fellow's traveling about a bit, but this jumping from Siberia to Montana without any satisfactory intermezzo is something which ought not to be encouraged.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

Bob White.

I CAN hear the notes of Bob White from the window of my office, located within 80 yds. of a mill where thousands of spindles are turning out thread and hundreds of looms are making it into cloth. All through our section in the fields and forests he is to be found. Civilization does not cause him to move his haunts. He loves the fields which the hand of man has taken from the woods, and in the grain which the husbandman has failed to garner he finds his choicest food. He loves oats, wheat, corn, peas and the seeds of the herbage which spring up after the harvest is gathered. Here he will stay for many generations.

NORTH CAROLINA.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Where to go.

ONE important, useful and considerable part of the FOREST AND STREAM's service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

ANGLING NOTES.

Fishculture in New Zealand.

LAST winter during holiday week, a telegram followed me from place to place which read: "Will arrive in Albany to-night. Can you meet me there? Reply at Murray Hill Hotel," and the message was signed L. F. Ayson, Fish Commissioner for New Zealand. As the telegram caught me in Albany, I had only to wait for Mr. Ayson to arrive, which he did a few hours after I received his message, and for about twenty-four hours I had a visit with one of the most earnest and enthusiastic fish-culturists it has been my good fortune to meet. Mr. Ayson had been directed by his Government to examine the fishcultural establishments and fish commissions of the world, practically, and he had a year's time in which to make his tour. When I met him he had visited the principal fish breeding places in continental Europe and Great Britain, Canada, the United States Fish Commission in Washington, and various hatcheries operated by the United States, State of New York and other States, and nowhere had he found attention given to hatching what are commonly called commercial fishes, as in the United States. The methods, too, he found to be far advanced in this country, as a rule, over those practiced abroad, but this he believed he would find to be the case before he left home, and for that reason he had planned to visit the United States last, instead of coming directly here from New Zealand. He had timed his return journey so that he might take home with him a quantity of impregnated eggs of our fishes, notably the whitefish. The success already attained from introducing into the waters of the Antipodes fish from Europe and America is remarkable, considering the adverse circumstances under which the experiments have been carried out; and the rapid growth of fish established in these new waters has been phenomenal, particularly in the case of brown trout (*farlo*), which grew to greater average size than in the waters of England, from which the original stock was obtained.

The salmon (*salar*) experiments have been less successful, as greater difficulty has been experienced in transporting the impregnated ova the long distances between the mother country and the colonies, and such as have survived and reached the smolt stage and descended to the sea have not returned in quantities encouraging, up to this time, to those having the matter in charge. Mr. Ayson is of the opinion that the young salmon descending to the sea are destroyed by sharks, porpoises and other sea fish, at the mouths of the rivers, but he is hopeful that the royal fish may yet become a source of pleasure and profit in the rivers of New Zealand. The brown trout has thrived in a most marvelous manner, but shows a characteristic which is peculiar to the same fish when planted in the waters of this country, by declining to take bait or lure for a considerable period after the fish are established in any particular water. In fact, in New Zealand the large brown trout are almost always taken with bait of some sort, and rarely with the fly. Ten years ago my friend, Mr. Robert B. Marston, editor of the London Fishing Gazette, sent me some eggs of the Hampshire (brown) trout, and when they were hatched I planted the fry in what is known as Halfway Brook, one of the best trout streams in New York, a large stream that has in its best days furnished native trout up to 5 lbs. in weight. The trout did well in the stream, and that they bred was evidenced by the catching of young fish several years after, and I then planted more brown trout in the stream. Fish of this species, up to over 3 lbs. in weight, were brought to me for identification, but I had reason to believe that they were not taken legitimately, for nearly all were taken by one man, who was never known to fish with hook and line, but he netted and sold minnows for bait. Men who fished the brook with hook and line, that is men who I know fished this way, did not get any big brown trout. Last year brown trout were taken occasionally with worm, and this year some big fellows were taken by using small minnows, and finally they were taken with fly. My own opinion is that they require finer fishing with fly than our own trout *fontinalis*, and that few of the fishermen who fish this stream ever try the fly, but more have been taken this year in what is positively known as fair fishing, than ever before, for every few days brown trout are reported from the stream, and I have little doubt if the stream is skillfully fished with fly as is done in England, that brown trout would be taken. Unfortunately, the brook is

so overgrown with alders that it rarely tempts the few fly-fishermen who resort to it. It is a far cry from New Zealand to fly-fishing in New York, but it has been impressed upon me within two years that bait fishing is giving way to fly-fishing in the region in which I live. I know this from the people who ask me about flies, and who confess that fly-fishing is a new departure for them, and once a fisherman is successful with artificial flies he is loath to return to the barnyard hackle.

Sunapee Trout in New York.

Within a few days I have received two letters dated within five days of each other, from two gentlemen in different parts of this State, making inquiries about supposed Sunapee trout caught in New York waters. The first, written by a clergyman in Keeseville, Essex county, reads: "I have this morning been showing to a friend, an ardent and very successful trout fisherman, the copy of the Fisheries, Game and Forest Commission Report for 1896, and am so much interested in a statement which he made that I forward it to you. Late last summer he was fishing Wall Brook, in the town of Schuyler Falls, Clinton county, which empties into Lake Champlain through Salmon River. Using a worm for bait he caught a red trout weighing from 4 to 6 lbs., unlike anything he has caught before, and his experience as a trout fisherman in lakes and streams is a wide one. Two other trout fishermen who were with him had never seen one like it. The trout was very game and fought like a half-pounder. In looking over the report, when he came to the picture of the male Sunapee trout, he said: 'That is the very trout I caught last summer.'"

The other letter is written by a lawyer in Lockport, and reads as follows: "During last week there were caught near Olcott, in this county (in Lake Ontario), several fish about which I ask your aid as to their identity.

"An old fisherman who caught them stated to me that he had never seen their like before, although he has for many years been a net fisherman at Olcott. I examined one of the fish and found it in appearance to resemble the lake trout very much, and in fact to be as I thought from its appearance one of that species. However, it had none of the usual markings of the lake trout, no mottled spots or coloring of any kind. There was a silvery appearance over the whole body with no spots of any kind. The general shape of the fish was that of a lake trout, and upon examining the second annual report of the Fisheries, Game and Forest Commission, I found there described the white trout, or as it is also called, 'golden trout,' or 'Sunapee sabling.' The fish I refer to was exactly represented by the illustration of the female Sunapee trout. Is there any reason to believe that this trout is to be found in Lake Ontario? Otherwise, do the lake trout of that lake appear in the form of the one I have described, without markings of any kind? I have seen the lake trout in many different places from Lake Ontario to Puget's Sound, and in all cases think I can recall there have been distinct markings on the fish consisting of mottled spots with purplish tinge, and also spots of a yellowish or salmon tinge. The absence of these spottings made me think that possibly the white trout had been planted in Lake Ontario through the efforts of the New York Fisheries Commission or in some other way, and I am in hopes that it is so, as that species would seem to be a valuable addition to the fish supply of the lake.

"I had the fish cooked, and its flesh resembled in color the flesh of the lake trout, and was very delicate and palatable."

It was rather curious that two letters dated so near together should ask about the same species of fish, and that a brook fish in one part of the State, and a lake fish in another part of the State, should have been recognized from drawings in the same volume as the male and female of the species, when, as a fact, the species does not exist in either of the waters. So far as is at present known, the Sunapee trout or sabling is found only in Sunapee Lake, New Hampshire; in another lake in the same State, and in Flood's Pond, in Maine, or more correctly, they are native only to the waters named, for I believe the fry have been planted in New Hampshire waters, to which they are not aboriginal, and the same may be said of Maine, as they have been cultivated in that State from the stock found in Flood's Pond.

The only attempt made to establish the Sunapee trout in waters outside of the New England States named, so far as I have knowledge, was made by the Fisheries, Game and Forest Commission of this State, when it sent the State fish car to Sunapee Lake and made an exchange of fish with the New Hampshire Fish Commission, obtaining sixty adult Sunapee trout from 2 to 5 lbs. in weight. Forty-two of these fish, evenly divided as to sex, were planted in Lake George, and the balance went to the stock ponds at the Caledonia hatching station and to the New York Aquarium, where they subsequently died. During the journey from the New Hampshire State hatchery to the New York fish car, where the fish were crowded into one-tenth or less of the water they should have had, they proved themselves to be the most hardy of any fish of the salmon family that I have ever handled. Except for the driver of the wagon, I was alone with the fish, and I did not dare use the water in the streams that we crossed, as all were swollen and discolored from recent rains, and every fish appeared to have its head out of water seeking the oxygen the water did not afford, so that I had serious doubts of handling a single fish alive at the car, as all were weak from the exhaustion of artificial spawning only a day or two before. At the car the fish were taken from the four cans in which they had made the mountain journey and placed in fifty cans with fresh water and ice to reduce it to the temperature of the hatchery breeding pens, and during the subsequent all-night journey all but two of the smaller fish recovered and were planted in apparent good condition, but I never expect to see another lot of any species of trout that will live through what those fish did, in spite of changes in temperature, overcrowding, leaky steam valves, missing train connection and adverse conditions generally, and I doubt if so many would have survived except for a plucky crew of men who could go without sleep or food, and did not mind water hot or cold. After the Sunapee trout were planted in Lake George, on a shoal in mid-lake, for they are lake fish and spawn on shoals in the lake, and do not enter streams, one was caught by a lake trout fisherman the following spring, but recognized by the man, as he was the

captain of the steam launch which took them to be planted, the fish was released uninjured. They have been seen on the shoal where planted at breeding times, and it is hoped that they will thrive and multiply.

The fish caught in Clinton county may have been an unusually high-colored male *fontinalis*, as it was taken "late last summer," for a breeding male *fontinalis* is sometimes as highly colored as a male Sunapee trout, and the latter presents the deep red of the illustration only in the autumn. If it was not a breeding male *fontinalis*, I do not know what it could have been, but it was not a Sunapee trout, for they do not enter streams.

When the first report of the Fisheries, Game and Forest Commission was issued, a gentleman who has been an ardent trout fisherman all his life, told me that the male *fontinalis* shown in colors in the salmon, and reproduced in the second report, was of such vivid red on the belly as to be overdone, for no trout was ever so highly colored.

I complimented him by saying he must always have fished in the open season, and had never seen a breeding male in breeding finery. Later I dipped from one of the stock ponds at a State hatchery a lot of breeding male trout, many of them more highly colored than the trout in the illustration, and the same gentleman, when he looked at this, remarked that he had nothing more to say about the red of brook trout.

As to the Lake Ontario fish, it was probably a lake trout and nothing else. In more than twenty years of lake trout fishing, fishing every year with fair success and taking in the aggregate a good many trout, I have caught three trout which would answer fairly well to the description given in the quoted letter, and the three are all that I have ever seen, although I have heard of other similar fish. My fish were deep, short fish, with small pointed head like the fresh run sea salmon, and the flesh was of a richer salmon color than the ordinary run of lake trout from the same waters, but they lacked the mottlings of the average lake trout, or rather the mottlings appeared to be covered over by a thick coating of silver. All the same, they were lake trout, but of finer flavor with thicker cream curds between the flesh flakes than their fellows of the same species. As a matter of fact, in dire necessity on one occasion, I passed one of the three fish off as a salmon at a luncheon given by my mother. I was not afraid of the women, nor of some of the men, but I was afraid of two of the men. One of the men afterward asked me where I got that salmon, and I said I telegraphed to Blackford's in a hurry to get a fresh fish. That was absolutely true, but I did not tell him that Blackford replied that he had no green salmon, and so I had rung in a lake trout, cold boiled and covered with Mayonnaise, for the fish was a ringer sure enough.

Landlocked Salmon in Lake George.

Several queries have come to me this year about the landlocked salmon which have been planted in Lake George and Lake Champlain, and as to the probabilities of catching them. The first plant of these fish was made in the lake in 1894, consequently they are now five years old. About a dozen were caught last year, the largest weighing 6 lbs.

This year I have not been able to go to the lake, but I have heard that eleven fish have been taken and that the largest weighed 11 lbs., although I cannot confirm the weight. Of six that I know to have been caught, the largest weighed 7½ lbs., and the others 6, 6, 5½, 5 and 5 lbs. respectively. Another is reported to have been caught weighing 8 lbs., but I cannot confirm the weight any more than in the case of the alleged 11 lb. fish. Every man that has caught a salmon knows that he has been fishing, and Warren Harris, an old man and old professional fisherman, who caught the 7½ lb. fish, admits that he had a regular case of salmon fever, and his son says he was still shaking when he came ashore with the fish. The tactics of a hooked landlocked salmon puzzle the lake trout fishermen who have had no previous experience with his serene highness, the ouananiche, as he does more of his fighting out of the water than the black bass, the only leaping fish they are accustomed to. I cannot conscientiously advise any of the people who have written to me to come to Lake George solely for landlocked salmon fishing, as they are not yet taken in sufficient quantities to warrant an extended journey. Such of the fish as have been taken have been taken on the surface, chiefly by fishermen while trolling for lake trout, and the proportion of salmon taken to the men engaged in fishing is small, although more may have been taken than has come to my knowledge. That the water of the lake suits them, and that they find plenty of food, and are well distributed in the lake is an assured fact, and that they have gone into the streams to spawn is also known, so I think in time the landlocked salmon fishing may be very good in Lake George.

As to Lake Champlain, I have had no reports this year, but last year quite a number of salmon were caught in the lake, and I presume this year, when the facts are known, it will develop that more were caught than last year. I do not know but I have mentioned in these columns, that last fall after the ice formed in the bays of Lake Champlain, I was at Port Henry with a United States Fish Commission car planting fingerling landlocked salmon, and on the day of our visit a salmon of 5 lbs. was caught through the ice by a perch fisherman. I have since learned that the fish was caught opposite and quite near to a stream where the fingerling fish have been planted annually since 1894, and I now believe it to have been a fish that had spawned, as the time was late December.

A. N. CHENEY.

From the Fishing Waters.

FOND DU LAC, Wis., May 19.—While bass and perch have been taking the hook in Lake Winnebago, and many fine strings have been brought in.

METROPOLITAN, Mich., May 15.—Local anglers have taken many brook trout in the nearby waters.

IRON RIVER, Mich., May 16.—The fishermen have reported strings of from fifteen to forty trout from the Iron River, four miles from here.

ELMWOOD, Mich.—Our streams here for trout fishing are the Paint River, Bush River and Ontonagon River. Bush River is considered to be the best one, five miles east; Ontonagon River second, four miles west, and Paint River runs near by.

League of Salt-Water Fishermen.

NEW YORK, May 20.—*Editor Forest and Stream:* We hear many complaints made by the net fishermen in opposition to our efforts to restrain them and keep them out from nearby waters. The objection they urge is that we are depriving them of a living. Well then, what shall we say about the tackle and bait dealers, boat builders and those who hire boats to fishermen? These men must make a living too.

We are not depriving anyone of anything, but just at present our only effort is to enforce the laws; and if these men who complain of us were not in the wrong they would not cry out. The shoe pinches.

If we are successful in our efforts, and fishermen may know that fish are to be caught in the rivers and bays, the men who are now netters we are sure would make a better living than they do now. As an example, consider Jamaica Bay and Long Island Sound and its bays, where net fishing has been stopped. The people there are building more boats for the accommodation of the fishermen, just because they see that there is a better fare for them. Those who now net fish in the Hudson I am sure would derive the same benefit as their brothers who formerly netted in the Long Island waters mentioned, if the law in the Hudson were enforced and similar conditions created. The Long Island netters at first cried that they would starve if the law was enforced; but now see the result. They are the very ones themselves to come into this league and help us. And why? The reason is clear. Of course there will always be a few grumblers, but in spite of them the world moves on just the same.

It is said by some of our critics that we do not know just what we want. We do know. We want them to confine themselves to their proper ground outside of Sandy Hook and give to the working class its rights. For it is the working class as a rule which includes those who suffer by the inroads of the netters, and not the rich; for the rich can go elsewhere to places that are well protected. But the salt-water fishermen of New York wish to enjoy the same privileges as the fresh-water fishermen do, and they may enjoy them too, if they insist upon their rights, and defend the waters from unlawful netting.

The contention of the net fishermen that if netting near New York shall be prohibited by an enforcement of the present laws, fish will be scarce in the market, we know, and everyone knows, is not sustained by the facts. The fish are very plentiful in the market, so much so that the market is often overstocked; and frequently in order that prices may not be lowered, cases of fish (and of the very best varieties) received by the market men are not opened but are sent down to Barren Island and are there destroyed. What do the fishermen get for them? No commission; that means no money. This condition has been investigated thoroughly, and we know it to be as here stated. It may be recalled that on one occasion of when two carloads of fish had been sent from Galilee, N. J., one carload was sold and the other was sent back to the shippers and dumped on the beach; a hole was dug in the sand and the fish were buried in it.

We salt water fishermen in general are a generous and well-meaning class of citizens. We aim to do justice to all; but we are determined to have justice done to us. We propose to maintain our rights in this the greatest State in the land. We have set out to protect the waters from illicit netting, and this is precisely what we shall accomplish. We ask the support of all right-minded citizens, interested directly or indirectly in salt-water fishing or not. The progress we have already made is an assurance of our ultimate success. We are engaged in a righteous cause, and it will triumph.

I shall from time to time announce in FOREST AND STREAM the public meetings of the League, and your readers are invited to be present and join with us in our work.

T. BIEDINGER, Pres.

New England Fishing.

BOSTON, May 20.—Fortunate is the fisherman who has a friend who owns a fine trout preserve, and still more fortunate is that man when the invitation comes for a fishing trip. Mr. George N. Talbot owns such a preserve at Windsor, Conn., and his friends know how to appreciate it. Messrs. John Fottler, Jr., A. N. Parlin and C. H. Olmstead, all of Boston, were invited down there last week, and it was a royal fishing trip. In the first place the trout fishing was all that heart could wish. Then the entertainment was such as a man of Mr. Talbot's means and generosity is able and glad to make. Some good successes are occasionally reported in Massachusetts brooks not yet under control. Mr. C. C. Merrill, of Boston, mentions a fishing excursion recently taken. A friend invited him to fish a stream not over twelve miles from the Massachusetts statehouse—the location is not given, for fear that the rabble will want to fish there. They drove to the stream. The friend showed Mr. Merrill a hole that he considered a good one, but went up further himself. Mr. Merrill began fishing. One, two, three, and up to half a dozen trout were taken. Finally three big ones came out, one after the other. Just then the man who "knew all about the stream" came back without a fish. To say that he was surprised at the catch Mr. Merrill had made does not overstate the case. Finally, he frankly confessed that he thought there might possibly be a trout or two in that hole, but considered his own chances much better further up.

Mr. W. S. Hinman has gone to Rangeley. Mr. Frank Magee, who has fished the Rangeley waters for many seasons, having been trained to the sport by his father, has started for the Rangeleys, accompanied by Mrs. Magee. Messrs. A. H. Proctor and A. F. Breed of Salem, have gone to Sebec Lake, Me., for salmon fishing. Then they go to Moosehead to try the trout, and later they will wind up the trip at the Rangeleys, where they have had good success in former seasons. Another of the leading Boston fishing parties is off for Col. E. B. Haskell's camps, Allerton Lodge, Mooselucmaguntic. In this party are an ex-Mayor and one or two military colonels, all noted fishermen. Their names are H. T. Rockwell, E. B. Haskell, Henry A. Priest, Edwin U. Curtis, John A. Lowell, D. F. Appel, G. W. Russell and Henry N. Sawyer. Mr. Rockwell has fished the same waters for nearly thirty seasons, and the party always

carries his name. Great success in large fish was put down to the score of this party last year.

Another party of leading Boston, Cambridge, Worcester and New York business men started for Moosehead Friday night. The party includes G. A. Fales, Boston; J. H. Davis, S. R. Ellis, Cambridge; Frank Holden, Frank Fitzpatrick, Boston; M. K. Green, Jamaica Plain; W. F. Perkins, Wakefield; C. W. Cheney, Boston; B. Heslor, Worcester; J. M. Deal, St. Albans, Vt.; M. Bullard, Cambridge; H. C. Dilworth and Mr. Ditmar, of New York. Mr. L. E. Pierce, of Boston, has been commodore of this party for many seasons, and under his management they usually have good success and a good deal of fun. He has a record of twenty-five trout, every one taken on the fly, on the 20th and 21st days of May last year, which is remarkably early for fly-fishing at Moosehead.

The report has just come to hand that Mr. M. P. Clough, of Lynn, has taken a salmon weighing 8½ lbs. in the waters fished by the Oquossoc Angling Association, head of Mooselucmaguntic Lake. The same report also states that Mrs. Henry Roeloffs, of Philadelphia, who has visited the Oquossoc Association camps for many seasons, has just taken a salmon of 10 lbs. J. S. Bartlett, B. N. Johnson and C. W. Fox are on a fishing trip to Rangeley waters. D. T. Dudley, C. W. Arnold and P. B. Heintz are on a fishing trip to the same waters. F. A. Kennedy and C. S. Denison, of the Dobsis Club, are at Grand Lake. C. Z. Bassett and E. E. Pecker are on a fishing trip to Billy Soule's Pleasant Island camps. They will doubtless visit other sections of the Rangeleys. Mr. John E. Deylin has gone to Sunapee Lake, N. H., for a fishing excursion.

Boston, May 22.—Interest in sport with rod and line was never greater. Fishing parties are numerous and of large size. But in truth it must be stated that up to date the fishing has not been great in the principal Maine and New Hampshire waters. The weather has been very cold for the past week, with disagreeable rains, and the water has continued especially high. Still, reports of success are beginning to come in. Better reports are being received from Bemis. Mr. J. Ross True and Mr. Herman Bickford, of Auburn, landed seven trout there on Thursday, the largest weighing 4¾ lbs. Mr. True's first strike was within ten minutes after he threw his line over and within ten rods of the shore. A letter from Haines Landing, Mooselucmaguntic, dated Friday, says that the fishing at that point is now at its best. Several large fish have just been taken. Mr. R. Babcock, of New York, has taken two salmon of 5¾ lbs. weight; two of 3 lbs. and two of 2½ lbs.; two trout of 4 lbs., and three of 3½ lbs. Mr. Walter G. Clark, of North Attleboro, Mass., has caught one salmon of 7 lbs., and one of 5½ lbs.; two of 3 lbs. and two of 2½ lbs., with several smaller ones. Ira Richards, also of North Attleboro, has made a record of one salmon of 6¾ lbs., one of 3½ lbs., and some good trout. Mr. William Reed, of Brockton, Mass., has taken a salmon of 8 lbs., and a trout of 4¾ lbs. Rather better success is being reported from Lake Auburn, Me. On Wednesday Mr. Frank Hamilton caught a salmon there weighing 9 lbs. He also secured a "red spot" of good size.

Sportsmen are unusually numerous at Moosehead. It is plain that business has been better, and that successful merchants are taking a much-needed rest. The list of anglers registered at the hotels has never been better. Mr. George F. Searls, of Bangor, has taken home fifteen trout, the string weighing 25 lbs.; the largest, 3½ lbs. Dr. W. S. Houston, of Greenville, has hooked and landed a trout of 3½ lbs. Thomas Walker, of Portland, has also taken a big one. Dr. Houston and G. W. Brown also report a catch of 63 lbs. in a few hours' fishing.

At the Mountain View House, Rangeley Lake, the first big fish to go on record this season was a trout of 5¾ lbs., taken by W. W. Thomas, of Portland. May 16, Mr. F. W. Smith secured a trout of 4½ lbs., and a salmon of 4 lbs. Mr. J. R. Marble, of Worcester, Mass., secured a trout of 4½ lbs., and Mr. L. H. Terry, a trout of 3½ lbs. Mr. F. V. Prentice, of Worcester, is at the Mountain View House, where he has been for a good many seasons. One day last week he took twenty trout, the largest weighing 6¾ lbs.

The last reports say that the smelt are fast disappearing, and there is little doubt but what the fishing will be better very soon. The smelt have been remarkably numerous in all the trout and salmon waters of Maine and New Hampshire, with more than the usual number of dead and dying on the surface. Later these little fish disappear—no one knows whither—and the trout and salmon that have been feasting on them are forced to seek other food.

Canadian Licenses.

QUEBEC, May 20.—*Editor Forest and Stream:* Every non-resident of the Province of Quebec wishing to fish and hunt on our territory is obliged by the law to first take a license. In the interest of the Province, the Department of Lands, Forests and Fisheries has thought that so far it was better not to apply that law to clubs and individual lessees of hunting and fishing territory; nor to their invited guests and honorary members of clubs. So many abuses, however, have been the consequence of this toleration that it has become necessary to apply the law in certain cases. The Department has quite lately addressed to all the lessees and to all secretaries of clubs the following circular, which explains itself:

"Hitherto the law compelling all non-residents of the Province of Quebec to take out licenses for fishing and hunting, has not been applied to non-residents invited by lessees of hunting and fishing territories, or the honorary members of incorporated clubs.

"I have the honor to inform you that with the view of putting an end to numerous abuses, the Department has decided that in future the bona fide active members of an incorporated club and the lessees of hunting and fishing territories in the Province of Quebec, shall alone be exempt from obtaining an extra license to fish and hunt in this Province.

"Therefore, honorary members of a club and guests who are not residents of the Province must, in future, obtain a license, the fee for which shall be as follows: \$10 for a fishing license and \$25 for a hunting license, or \$1.50 per diem for the right to hunt and \$1 per diem for the right to fish when a license is required for three or four days only.

"Please take note of this decision and notify the mem-

bers of your club for you will be held responsible for all infringements of the law in this respect and any such infringement might entail the cancelling of your lease.

"To facilitate the obtaining of licenses, secretaries of clubs can, on application, have sent to them a certain number of blanks which they can fill up for the convenience of their members and remit the fees to the Department.

"I have the honor to be, sir, your obedient servant,
"S. N. PARENT,
"Commissioner of Lands, Forests and Fisheries."

CHICAGO AND THE WEST.

Wausaukee Club.

CHICAGO, Ill., May 20.—Wausaukee Club, of Chicago, one of the pleasantest fishing organizations in the city, will have quite an elaborate time on Decoration Day. There will be a special car, which will leave Chicago Saturday (night, and among others of the party will be the following: J. Allan Preisch and wife, C. H. N. Tobey and wife, C. D. Hoard and wife, George S. Thurber and wife, B. D. Campbell and wife, H. K. Allen and wife, Messrs. W. R. Root, F. K. Root, H. C. L. Goggett, F. G. Hoynes, W. R. Schutze, G. P. McWilliams, P. B. Gibbs, H. B. Cook, J. A. Bloomington, with others not yet heard from. Wausaukee Club is out of debt, and owns 4,000 acres of land. The grounds are near the Peshtigo River, and there are near by many small streams and lakes that offer fine sport at trout and bass. The club buildings have been much improved and are in fine shape. There is a piano for the use of the musical element in the club. The table at this club is uniformly good. The club numbers about 100 now, twelve new members having been added recently. Sixty thousand brook trout will be planted this season in the Wausaukee River alone, the club keeping up this policy of stocking the stream. The entering point for this club is Athelstane, on the Chicago, Milwaukee St. Paul Railway. This is in the center of a very good sporting region. It goes without saying that the Wausaukee Decoration Day gathering will be a distinguished and happy one.

Bad Season for Trout.

We have been having the worst sort of weather here for the past ten days, and our trout season is badly disfigured. Heavy rains have swollen the streams and the temperature in the pine woods has been sub-Arctic. Continued advices of this sort have held back most of the trout travel thus far. A few parties will go out at the end of this week, and so far as human judgment may predict, these should have good success, for the weather is now clearing and bids fair to give us sunshine enough to warm the streams. Among other Chicago gentlemen who will go north to-day is Mr. Frank B. Orr, of Orr & Lockett, this city, who goes to the Prairie River, via Merrill, Wis.

Methods in Fly-Casting and Fly-Tying.

I am in receipt of a letter from Mr. Jephtha G. Dunlap, who writes from San Jose, Cal., regarding some matters which may perhaps be of interest to readers of the FOREST AND STREAM. His letter is in substance as below:

"The fact that, so far, little interest has been manifested in what has been said on the Taylor method of fly-fishing need not be taken as evidence that the articles on that subject as presented by you and Mr. Taylor were not of great interest to at least some of the angling fraternity. As for myself, although I have not until this late day written you concerning the matter, I have not only been so deeply interested as to copy in my book of items relating to fishing and shooting the practical or salient features of the various papers referring to it, but to re-read them very carefully several times; something which in other cases I rarely take time to do. Anglers, like other people, are many of them wedded to their gods, and when a man spends years in worship at a special shrine which represents to him the highest and the best—when the long, light cast and the rod with its appurtenances which best accomplish this are the objects of his devotion, he will not turn aside from them except with reluctance. So an innovation, such as this new method at first sight seems to be, very naturally meets with his disapproval. To me, however, it is not abandoning the old, but simply adding to it a new interest. There is plenty of use for the old method in every day's fishing, and if I should find it desirable to employ the new under such conditions as make it admissible, I should certainly find the old necessary with sufficient frequency to add the zest of variety.

"In one or two respects there is an apparent discrepancy between you and Mr. Taylor. No doubt your explanation would not only be satisfactory, but additionally instructive; for in the absence of seeing Mr. Taylor fish there are still some things which it would be desirable to know. In your description which appeared in FOREST AND STREAM of May 28, 1898, you say: 'Instead of casting with lightness and delicacy, he was slashing away as hard as he could, cutting up the surface of the water into long ridges, the whole leader and part of the line landing on the water and causing the greatest confusion.' Further on, Mr. Taylor says to you: 'Don't try to cast easy. Make all the splash you can. Wake up your trout. That is what I do.' While in FOREST AND STREAM of Sept. 3, 1898, Mr. Taylor says: 'I generally fish with a short line, 5 ft. leader, and cast the fly over the pool several times in succession before allowing it to alight; then I allow my fly to touch the surface of the water lightly several times, always keeping the leader and line from striking the water. After repeating this performance a number of times, I allow my fly to alight on the water, always a few feet up stream from the point where my previous casts have been made (as described by Mr. E. Hough in the edition of May 28, of FOREST AND STREAM), and then allow the fly to drift slowly down stream; thus it passes over the previously agitated water, and this is the most killing way to fish for large trout.' This differs so much from what he said and did on the Prairie River that one might think he had afterward evolved a new and better way. In the former case the leader and line were cast upon the water with the intention of making a disturbance; in the latter the leader and

line are kept from striking the water. This point is further emphasized by Mr. Taylor where he meets with several anglers on the stream, illustrates to their skeptical minds the superiority of his method and then was amused at their efforts to imitate his new style of casting. He says 'they would slap line, leader and flies violently upon the surface of the water, which was a most comical and amusing sight.'

"Would you be kind enough to make a simple illustration of a fly which has been trimmed in accordance with Mr. Taylor's idea, showing the difference between the original fly and the fly after trimming. But if this seems an unnecessary trouble, be so good as to make it plain as possible in words. I would like to know just where he cuts the feathers, how much, and how the fly looks after the operation. As it is stated in one instance that the wing is trimmed and in another that more than two-thirds of the hackle is cut away, I am left somewhat in doubt as to whether both wing and hackle are reduced or whether it may be one or the other, according to circumstances.

"As Mr. Averill's paper on Japanese fly-fishing has been associated with Mr. Taylor's method. I am reminded to ask you how the hackle on the enclosed fly compares in respect to thinness with the Japanese article I have tied it on a sproat hook, not, of course, having one of the Japanese, and I regret having at present no finer gut. It will, however, answer my purpose in reference to the hackle, and will also, I feel certain, take you some good fish if you give it the opportunity. The only way I can devise to make the hackle thin enough without the too tedious process of cutting out the alternate barbs is to remove the web entirely from one side of the feather. If this does not give the desired result, I would like to know by what method the Jap has the advantage of me."

I have recently been so much besieged with inquiries about this sort of fly-casting that I am prompted to take up the above communication at some length. In the first place, the discrepancy in the descriptions of Mr. Taylor's style of fly-casting is not a discrepancy of actual facts. I described only what I actually saw in practice, and in very effective practice. Laying before Mr. Taylor these remarks of Mr. Dunlap, the former said to me that I was quite accurate in my description, but that very often when alone he practiced the semi-dry fly method which he had himself described. He said that this sort of casting was so tiring and so hard on a rod, as well as on the wrist, that he did not always use it, except when he was out gunning for big trout. He stated further that the principle was still the same; that is to say, of waking up the trout by repeated appearance of the fly. The last cast was not made with any attempt at lightness or delicacy. Mr. Taylor once more repeated to me that he had often walked down on a big trout in a quiet pool, by cutting up the surface of the water with repeated slashings of the line. Reading together of the English method of dry fly-fishing, he rather laughed at the latter, and said he felt confident that he could kill the shyest trout of the English meadow streams by this same slashing way of fishing, which he declares he has never found ineffective on any stream that he has ever fished.

I fished with this same angler on the Prairie River again one day this week, last Monday, and we tried the same method which I described last spring, and we found it effective. In one case Mr. Taylor was cutting away at the water on the side of a log, when he raised a big trout, which sprang at or over the fly. A few moments later he raised the same trout again in the same manner, but again failed to hook him. Stepping back to change his fly, he said to me: "Go ahead in there, Hough, and see if you can get him." We had now seen this trout twice, and he might well have seen us, for we stood in the stream less than 15 ft. from the stump where he lay. I began cutting the water along the side of the stump, intending to flick it with the fly, but sometimes allowing a foot or two of the leader to strike the water. I kept this up on the same bit of water for some moments, and then out came the trout again, springing clear over my fly. We all laughed at this, and my wife, who was standing in the water near us, said that was the last we would see of that trout. Yet I still kept up the slashing along the edge of the stump, and in a few moments out came the trout for the fourth time! This time he seized the fly fair and full. I had good water to play him, and we duly put him in the basket, his weight proving 11¾ oz. Now, this trout was clearly an angry trout, and not a shy or timid trout. We worked for him, I should say, about four minutes before he was hooked, and we got him by deliberately teasing him out. Had we gone along the stream and worked that stump with a long line and a light fly we might never have known there was any trout there at all, and we certainly never would have caught that trout. Mr. Taylor explained to me that sometimes in casting a part of the line would strike the water, since one does not always cast as well as he wishes. This was not a vital matter, the main thing being the emphatic presentation of the fly directly in front of the trout. I cannot offer a better instance of the use of this "system" than the above account of how we teased one big trout out again and again, and finally caught him apparently against his will from first to last.

Now, as to the trimming of the fly to which Mr. Dunlap alludes, I have no means of making this absolutely clear. In general, I would say that the wings of most of our flies are twice as large as they need be. For this casting with a short line, or with a long line either, for that matter, you do not want a big feather fluffing in the wind. The wing of a drowned insect does not look very large. I should say that we removed on the average from one-half to one-third of the wing of the fly such as one ordinarily buys. The wing was left slightly shorter than the hook. When the hackle was very heavy we trimmed it also. The whole idea is to cut the fly where it needs to be cut, whether in hackle or wing, and to fix it so that it will cast well and look more like a drowned insect than a furry, fuzzy object as big around as your finger. Usually the wing was trimmed along the top, and sometimes it was shortened very much. By comparison with "store" flies, ours looked pretty naked.

Mr. Dunlap sends me a fly of his own tying, with the hackle very thin, as thin, I should say, as that of the Japanese fly which Mr. Averill sent to the FOREST AND STREAM. I left this fly with Mr. Taylor and asked him to

try it. He thought that he would be able to kill some nice trout with it later on. I do not know how the Japanese workman handles his material, but should think Mr. Dunlap's way of removing half the feather would be practical.

A Trip to the Prairie.

I have referred incidentally above to my little trip to the Prairie River this week. I ran up for a hurried look at this beautiful little stream, which is a pet water of my own. We went in by way of Merrill, on the St. Paul road, and had an eighteen-mile ride through the pine country, with a hundred colors in the woods about us and a thousand tints in the sky above. The sun was shining only in name, for the day was cold and windy and unsuitable for trout. The river itself was rather bleak looking, and felt cold through one's waders. On the first evening the ingenué of the party, who had never before set foot in a trout stream, managed to extract one husky trout from his native element, much to her mental exaltation. That ended the first chapter so far as we were concerned, though later on Mr. Taylor came in with about a dozen and a half of fine trout, one weighing 1½ lbs. Mrs. Cone gave us baked trout for dinner, and they came in on a big platter, and they stuck out over the platter. I should say there were half a dozen fish which weighed over 1 lb each, proof enough that there are big trout in the Prairie if you know how to get them.

On the following day the weather was still more inclement, though not enough so to keep us indoors. Mr. Taylor went along as guide-in-chief, and we two spent most of the day in an argument with a third member of the party, trying to convince her that she was not going to be forthwith drowned, overwhelmed and instantaneously carried away by the stream. Really, the Prairie River is not a wicked water, but the sweetest wading stream on earth. On that day we fooled along comfortably until afternoon, and I think took less than a dozen trout all told. On the next day Mr. Taylor and I went out alone, and this was the last fishing I had, as rain came on and the water rose 1½ ft. The morning was of wintry cold, with a raw wind, which made it hard to keep a fly on the water. At noon the sun tried to shine, but gave it up. At 3 o'clock rain began to fall, and after that we had to give it up and go home. In spite of all this we killed nineteen fish between us, and with the exception of three, I think all of these fish would run above 9 in. in length. Had we had decent weather we must certainly have made nice baskets that day, and indeed had nothing to complain of as it was.

Fishing a deep bend of swift water together about noon, I said to Taylor that I surely ought to raise a trout at the cut bank under the alders across the stream. I slashed in here several times, allowing my fly to drift out with the current. This I repeated several times, the fly floating down close to Mr. Taylor, who stood in the stream below me. All at once there came a big boil out of the water not 10 ft. away from him, and a glorious, brilliantly colored trout flung himself upon my fly. "Pound and a half, sure!" shouted Taylor. "He's thick as your arm." And it did seem very likely that this broad tail betokened a goodly fight. The fish struck across the current, taking the line off the click reel, and it seemed to me that he was heading for the roots of the alders with a view to breaking away. Thinking it best to stop him if I could, I put on a gentle pressure, and to our intense disgust the hook came free. I presume the fish had been but very slightly hooked in the side of the jaw.

"You didn't work that fish right," said Taylor. "If you had turned your line entirely free he wouldn't have gone across stream, but would have gone straight to the bottom. This old talk about keeping a tight line on a brook trout is all nonsense. If you set the hook in you can let the line go all you want to on a brook trout, though you can't on a rainbow or a black bass. The bass or the rainbow trout will jump and shake its head, but if you strike a brook trout his first thought is to go to the bottom."

I have never had time to test this bit of angling lore, but will certify that in this instance my tactics lost me a fish, though I thought I handled him as gingerly as I dared. Mr. Taylor promised to go back and catch that trout later on, and I am sure I hope he will. Within the next five days he will have grand sport with the trout in this stream. He very often gets them up to 1½ lbs., and has taken them over 3 lbs., though of course these are not usual weights. For the part of the stream which we fished I must say that the trout averaged better than I ever have taken in a Wisconsin stream. Of course, we used only the artificial fly, which is the only fit way to fish this stream. Of late years the Prairie has been visited mainly by fly fishermen, though I regret to state that I heard of three members of a local family who last week caught 125 trout on bait and sold them at Merrill for 50 cents a pound.

The Dalles of the Prairie.

We found time in our brief visit to go up above Dudley's place for a look at the beautiful "dells" of the Prairie River, where the stream pitches and tumbles for a quarter of a mile through a rocky gorge that might have been transplanted from the Rocky Mountains themselves. This water is a hard one to fish, and constitutes a natural preserve. There are few more beautiful reaches along any trout stream that I have ever seen.

Trout, Arbutus and Deer

Of all wild things these three are the shyest, the wildest and most difficult of approach, and in their way are rare and beautiful. In this little journey to the Prairie I found the home of all three. In the hill country I discovered ancient runways worn by the feet of many deer, and much fresh sign, and we saw one deer. Trout, and very beautiful trout, we had. And lastly, almost best of all, I found store of that wild, timid, sweet, unspeakably beautiful little wood's plant, the trailing arbutus. This last by grace of a season unnaturally late. Far back in the hills along the Prairie dwelt the father of our landlady, Mrs. Cone, and to this place we went, hearing that arbutus might be found not far from there. We were told that it was quite too late, and that all the blossoms were gone, but a son of the family consented to go and show

me where the arbutus had been. We went back a mile in the woods, waded through a cranberry swamp, and came to a little, mossy island. Here by mere good fortune we found a patch of the pink-white blossoms, in space that might have been covered by a tablecloth, but in quantity all that we desired. Of two trout baskets, one filled with trout and one with arbutus, I wis not which may be more beautiful, but surely both are exceeding good. Mrs. Cone, who rode with me through the wintry air on this quest, pronounced in favor of the arbutus. I ought not to omit saying that we put up at the farm of Delos Cone, about a mile and a half from Dudley. At the latter place we saw Mr. and Mrs. Daniels, of Denver, whom I had sent there earlier. They were having fair luck and intended to stay until good weather came, in which case they are sure to have some heavy fishing. On our way out of the woods we met a couple of gentlemen whom I do not know, but who were going into Dudley. I should think the best date to strike this country would be from May 20 to June 1, this being in ordinary years about the earliest of the Wisconsin streams. My own trip, short and cold as it was, was a very great pleasure.

How to Keep Flies.

Lately I spoke of keeping flies in a glass jar, as suggested by Mr. Mather. A friend tells me that he keeps all his flies in a cigar box, and that the smell of the tobacco makes his receptacle absolutely moth proof.

Habits of Planted Trout.

The same friend calls my attention to a fact which I had never before heard mentioned. "This roily condition of the water," said he (the Prairie River), "will spoil our fun, for these are planted trout. No trout are native to any of the Wisconsin streams which flow to the Mississippi tributaries, though they are found native in most of the Lake Superior streams, the reverse of this situation being true in regard to the muscallunge. These Prairie River trout were planted by old man Dudley about twenty years ago. I have always noted that in a wild stream where trout are native the condition of the water and weather have little or nothing to do with their feeding. On the other hand, in a stream where the trout are not native, the changes of weather and water make much more difference. The fish will not do much for us here so long as the water stays muddy and high, and we might as well be resigned. If this were a Superior stream I should not so much mind, for I should feel sure we could take at least a few."

I give this information for what it is worth, considering it at least good for consideration and investigation, and fit to be included in the trout iconoclast with which I have recently had a bit to do, what with fly-cutting, fly-casting with a short line, and other heterodox things as earlier recorded.

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

Fly-Fishing for Shad.

NEW YORK, May 19.—*Editor Forest and Stream:* I dimly recall having seen an article a number of years ago on the taking of shad with the fly. My impression is that this article is in your paper, and that it was written by Dr. Wm. C. Prime, but of this I am not certain.

I write to ask if you can put me in way of getting definite information in regard to this matter, or give me such information yourself, as will enable a friend of mine, in whose interest I write, to make trial of this style of fishing.

I wish to know whether it has been or where it can be practiced, and what flies have been successfully used.

T. H. S.

[We have from time to time printed notes on fly-fishing for shad, at Washington, D. C., Holyoke, Mass., and elsewhere. The best flies are small and light colored patterns, like the white miller, or white and ibis, dressed on hooks corresponding in size with No. 6 or No. 7 sproat. The current number of the *Game Laws in Brief and Woodcraft Magazine* contains an enthusiastic paper on "Fly-Fishing for Shad," by S. T. Hammond.]

Salt-Water Fishing.

THE first weakfish of the season in Princess Bay, Staten Island, were taken on May 17, two fish, weighing 2 lbs. each, caught by Mr. Isaac Smith.

The Paris Exposition.

We have received from the Commissioner-General for the United States the following classification of Group IX. at the Paris Exposition of 1900. As already noted the conduct of the exhibition of this group has been intrusted to Dr. Tarleton H. Bean:

Group IX.—Forestry, Hunting, Fishing, Gathering Wild Crops.

CLASS 49.—APPLIANCES AND PROCESSES USED IN FORESTRY.

Collection of seeds. Specimens of indigenous or exotic forest products.

Special implements for gathering, preparing, testing and preserving seeds; drying houses. Implements for nurseries. Equipment for tree culture and forest industries.

Processes of culture in nurseries. Processes of culture and of the management of forests.

Forest topography.

Forest works: keeper's houses, sawmills, tracks for hauling timber, sanitation, re-stocking (with animals, etc.).

Terracing: re-planting, turfing, etc. Planting to hold the surface of dunes.

CLASS 50.—PRODUCTS OF THE CULTIVATION OF FORESTS AND OF FOREST INDUSTRIES.

Specimens of forest products.

Wood for cabinet work, for building, for fuel, wood that has been worked; lumber; staves. Dye woods.

Cork; textile barks. Tanning, fragrant, resinous substances, etc.

Products of foreign industries; cooper's stock, basket work, manufactures of esparto, wooden shoes, wood wool, corks, kiln-dried wood, charcoal, raw potash, etc.

CLASS 51.—HUNTING EQUIPMENTS.

(Manufacturing Appliances and Products.)

1. Special machinery and tools used in the manufacture of arms; machines for straightening barrels; special lathes for instantaneous reproductions; machines for finishing the interior boring of barrels, boring machines; machines for punching gun barrels; special machines for making wooden gun stocks; milling machines, ma-

chines for reproducing different parts of arms in steel; machines for polishing and finishing tempered pieces.

Material and tools for the manufacture of cartridges and ammunition.

2. Side arms.

Arms for trophies; copies of ancient weapons.

Missile weapons. Bows, cross bows, etc.

Fire arms, guns, rifles, pistols, etc.

Accessories for fire arms.

Bullets, solid or hollow, explosive. Percussion caps, primers, cartridges.

Hunting equipments, appliances for training dogs.

Apparatus used in fencing schools.

CLASS 52.—PRODUCTS OF HUNTING.

Collections and drawings of land and amphibious animals, birds and eggs.

Skins and furs in the rough. Skins prepared for the furrier. Taxidermist's work.

Hair, horse hair and bristles. Undressed feathers and bird skins.

Horn, ivory, bone and tortoise-shell.

Musk, castoreum, civet, etc.

CLASS 53.—FISHING EQUIPMENTS AND PRODUCTS—FISH CULTURE.

1. Floating appliances used in fishing. Nets, tackle and implements for sea fishing. Nets, weirs, traps and appliances for fresh water fishing.

2. Marine fish culture; fish, crustacea, molluscs, radiates, etc.

Fresh water fish culture; installation, equipment and processes used in pisciculture; fish ways; culture of leeches.

3. Aquariums.

4. Collections and drawings of fish, cetacea, crustacea, molluscs, etc.

Pearls, shells, mother of pearl. Coral. Sponges. Tortoise shell. Whalebone. Spermaceti. Ambergris. Fish oils and fats.

CLASS 54.—APPLIANCES FOR GATHERING WILD CROPS AND PRODUCTS OBTAINED.

1. Appliances and implements for gathering the products of the soil obtained without culture.

2. Mushrooms. Truffles. Edible wild fruits.

Plants, roots, barks, leaves, fruits obtained without cultivation and used by herbalists, in pharmacy, dyeing, the manufacture of paper, oils, or for other purposes.

India rubber; gutta percha. Gums and resins.

The Kennel.

Fixtures.

BENCH SHOWS.

Sept. 4-7.—Toronto, Can.—Toronto Industrial Exhibition Association's eleventh annual show.

Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

FIELD TRIALS.

Nov. 6.—Bicknell, Ind.—Indiana Field Trial Club's trials. S. H. Socwell, Sec'y.

Nov. 14.—Chatham, Ont.—International Field Trial Club's tenth annual trials. W. B. Wells, Hon. Sec'y.

Nov. 14.—Washington, C. H., O.—Ohio Field Trial Club's trials. C. E. Baughn, Sec'y.

Dec. 8.—Newton, N. C.—Continental Field Trial Club's trials. Thos. Sturges, Sec'y.

Manitoba Field Trials Club.

WINNIPEG.—*Editor Forest and Stream:* At the twelfth annual meeting of the Manitoba Field Trials Club, there being quite a fair attendance of members, the secretary-treasurer's report showed the financial condition of the club to be most satisfactory. The election of officers for the ensuing year resulted in the following gentlemen being unanimously re-elected: Patron, His Honor, Lieut.-Gov. Patterson, of Manitoba; President, John Wootton; First Vice-President, Thos. McCaffry; Second Vice-President, N. G. Leslie; Honorary Secretary-Treasurer, William C. Lee; Managing Committee, W. F. Ellis, W. E. Macara and Jos. Lemon.

After considerable discussion, it was finally decided to hold the annual trials at Morris, on Wednesday, Sept. 6. A derby for setters and pointers will be the first stake, they to have been whelped on or after Jan. 1, 1898. Purse of \$225, divided into \$100 to first, \$75 to second and \$50 to third, entries closing July 1, 1899. This will be followed by an all-age stake for setters and pointers, with a purse of \$225, divided into \$100 to first, \$75 to second and \$50 to third, entries closing Aug. 1, 1899; forfeit \$5; starters \$10 in each stake.

Votes of thanks were passed to the management of the Manitoba and Clarendon hotels, to the press, to Mr. Frank Richards, who judged the trials of 1898 so satisfactorily, and to the officers of the past year. The old grounds at Morris will be again given a trial, but are to undergo a thorough inspection first.

WILLIAM C. LEE,
Honorary Secretary-Treasurer.

New England Fox Hunting.

BARRE, Vt.—*Editor Forest and Stream:* On the fox hunt I attended, New England style, the dog drove the fox to earth; one of the hunters filled in the mouth of the hole with stones and earth, to prevent the escape of the animal. In the evening I was notified that the fox was in the ground and was told to be on the spot at an early hour the following morning. Four able bodied men (myself inclusive) with as many dogs and with ample excavating tools were there at the appointed time. It was an old fox burrow, with many entrances. The dogs soon located him, and he was unearthed and delivered over to the jaws of death. This was the only fox the writer ever assisted to dig out. I consider it brutal and unsportsmanlike, and I would like to know from your fox hunting readers what the common feeling is about digging out.

B.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

Yachting.

ACCORDING to the latest announcements, the launch of Columbia will take place on June 8, and will be public, probably for the reason that the Herreshoff Works are divided by a public road, which cannot be fenced off or kept clear by means of watchmen. So far as secrecy is concerned, all is now known which is worth knowing short of the publication of the design itself, which, of course, is not to be expected. Thus far none of the designs of the Herreshoff boats, Navahoe, Vigilant, Colonia, or Defender, have found their way into print, but all have been kept successfully concealed; and there is no probability that the lines of Columbia will be made public for some years. This being the case, and the same applies to the British yachts as well, there is a comparatively safe field for the unscrupulous fakir who palms off the clumsy creation of his own imagination as the veritable similitude of the work of the great masters of designing, and proceeds to prove why one yacht must win from the other because of a difference of a few thousandths of a foot in some assumed element.

This sort of yellow journalism is but the natural result, and fitting accompaniment of the useless concealment and deception practiced by both designers and owners. It is not to be expected for a moment that the contesting parties in a great international match will at the outset reveal all of their plans to each other and the public; but on the other hand, by their absurd efforts at secrecy and deliberate attempts to mislead, they foster a competition in news-gathering which, as in the present case, brings to light all that they really need to conceal.

It is still possible to launch Columbia quietly and privately, as there would be little difficulty in merely lowering the cradle at midnight, with no special preparation; but it is probable that the announced programme will be followed and all will be welcome at Bristol, provided they pay their own way and stand in the public street.

On the other side it is now announced that a private view of Shamrock is to be accorded to royalty about June 7, but that the launching date will be kept secret, and that when the time comes but fifteen guests will be allowed to witness the momentous event. The yacht will have to be launched in the usual manner on sliding ways instead of a cradle on wheels, and with some time devoted to the matter of wedging up, etc., so that she cannot be slid off without previous preparation, but the Thorneycroft works are better protected from the public than those at Bristol, so that the view will be limited to a chosen few. If the report be true, and it is only in keeping with the general method throughout, that Shamrock is to be launched in petticoats, the spectators will have little to be thankful for after all, except the luncheon. It is said that the yacht will be shrouded in canvas so as to prevent any part of the underwater body from being visible.

At a moderate estimate, probably fifty per cent. of the alleged news published about Columbia, Shamrock, Fife, Herreshoff and Lipton is absolutely untrue, and another twenty-five per cent. is trivial, inconsequential and worthless. We have no desire to be unjust to Sir Thomas Lipton, and it may be that he is being misrepresented in the daily papers; but to all appearances he is bent on making a record as a letter-writer that is unique in the history of the America Cup challengers. The following is credited to him, as contained in a recent letter to an intimate friend in Omaha: "Perhaps you would like to have a look at the cup the Shamrock is going to win. Unless you see the cup before that boat gets out I am afraid you will need to come over here to have a look at it." Less ridiculous than this sort of boasting, but very, very funny, is the quotation from an earlier letter, in which Sir Thomas seriously states his doubt as to whether the Herreshoffs are really giving away any information concerning Columbia; as though the Herreshoffs ever gave away anything at all, even if of no commercial value. According to many alleged interviews, the skipper of Shamrock is little if any behind the owner in his confident statements concerning his coming success in American waters. The designer, Mr. Will Fife, it is needless to say, is yet to be heard from as to how easily his boat is going to win the America Cup, his time, at least, is probably better occupied with more serious matters.

ACCORDING to the report in the Yachting World, the work on Shamrock is much less advanced than it should be, and the yacht is likely to suffer in consequence from the lack of adequate preparation and trial. It now seems likely that by the time Shamrock is launched, and still a long way from completion, Columbia and Defender will be sailing against each other, with three full months for trial and alteration. Even when Shamrock is ready, there is nothing against which to try her, and she will need from six weeks to two months for the fitting out, crossing and refitting on this side. Such a handicap as this must prove a very serious matter, even though she may be quite as fast as Columbia under equally favorable conditions. If she is to be seen at her best on this side, she should be under way now, and racing with such yachts of her class, Meteor and Valkyrie III., as would really show her good and bad points.

Yacht Designing.—XXX.

BY W. P. STEPHENS.

(Continued from page 354, May 6.)

A THOROUGH familiarity with geometry, trigonometry and the kindred sciences on which his art is founded is always valuable to the draftsman, but it is by no means indispensable. There are, however, some of the more common terms connected with them which are in constant use, and must be perfectly understood; to which end the following definitions are given:

A *plane* or a *plane surface* is a surface such as that of a perfect drawing board, which is made up in all directions of straight lines. A *line*, so far as the draftsman is concerned, is a mark made by pencil, pen or other medium on a surface; it practically complies with the strict geometric condition, that it has length, but no other dimension. In direction it may be *straight*—the shortest

Fig. 69.

Fig. 70.

Fig. 71.

Fig. 72.

Fig. 73.

distance between two given points; *broken*—made up of a succession of straight lines; or *curved*, as in a circle. A *point* differs from a line in that it has position, but no dimensions, not even length.

An *angle* is the space, Fig. 69 (a), between two straight lines which meet at a point (c), called the *vertex* of the angle. The lengths of the lines have no relation whatever to the angle, which is measured by *degrees*.

The term *angle* refers strictly to the space or opening between two lines at the point where they meet without regard to the lengths of the lines or other limitations. In order to measure the angle, it is necessary to draw a *circle*, which may be of any *diameter* whatever. In Fig. 69 three circles are shown, either one of which may be used to measure the angle A. C. B. The circle chosen is supposed to be divided into 360 equal parts on its *circumference*, or 90 parts to each of the four right angles. The lines C. A., C. B., limiting the angle, cut from the outer circle an arc, A. B., which includes thirty of the parts into which the whole circumference is divided, or 30 degrees. The two smaller circles are also cut similarly at the 30 degree points. It will thus appear that the length of a degree as measured in linear measure on the circumference of the circle has no relation to the angular space included between the lines unless it is considered in connection with some definite diameter. It might be, for instance, 1 in. on the inner circle, 1½ in. on the middle one, and 2 in. on the outer one, and yet each arc would *subtend* the same angle, one degree.

The angle and the arc which subtends and measures it are commonly spoken of together as an *angle* of 30 degrees or an *arc* of 30 degrees.

A *right-angle* includes one-quarter of the space surrounding a point, hence it measures 90 degrees. If two lines be drawn so that the two angles formed by them are equal, Fig. 70 (a), each angle will be a right-angle, and the two lines will be *perpendicular* to each other. A line which is parallel to the lower edge of the drawing board is termed *horizontal*; and one at right-angles to it is termed *perpendicular*; or, "*a perpendicular*."

Two lines are *parallel* (b) when they lie in the same plane and are equally distant at all points, so that if prolonged to infinity they will never meet.

An *acute angle* (c) is one which is less than a right-angle; an *obtuse angle* (d) is one which is greater than a right-angle. Lines which intersect at other than right-angles are termed *oblique*; and obtuse and acute angles are also designated by the same term, *oblique*. If a right-angle (90 degrees), be divided into two acute angles, each is the *complement* of the other (e). If two right-angles (180 degrees) be divided into an acute and an obtuse angle, each is the *supplement* of the other (f).

A triangle is a plane figure bounded by three straight lines, which form three angles, Fig. 71 (a). The sum of these three angles must always equal 90 degrees or two right-angles. An *equilateral triangle* (a) has all of its sides (and angles) equal; an *isosceles triangle* (b) has two of its sides (and two angles) equal; a *scalene triangle* (c) has all its sides (and angles) unequal. A *right-angled triangle* (d) has one of its angles a right-angle. An *obtuse-angled triangle* (e) is one having an obtuse angle; an *acute-angled triangle* (f) is one having three acute angles.

The *base* of a triangle is that one of its three sides on which it is supposed to stand; if it be an *isosceles triangle*, the *base* is the side which is not equal to the other two. In any triangle the angle opposite to the base is called the *vertical angle*. In a right-angled triangle, the side opposite the right-angle is termed the *hypotenuse* (d). The area of a triangle is ascertained by multiplying any one side by the vertical distance to the opposite angle, and dividing the product by 2. Fig. 72. This is true even in the case of an obtuse-angled triangle (b), in which this perpendicular falls outside the triangle and on to the base produced. In a and b, the base and altitude being the same in each, the areas must necessarily be the same. The *center of gravity* of a triangle is found by drawing a line from the center of one side to the opposite angle and measuring off one-third of the length of this line from the side (c). It may also be found by drawing lines from the center of each side to the opposite angle, the three intersecting in one common point (d). As all plane figures bounded by straight lines may be readily divided into triangles, their *areas* and *centers* may be calculated by these two simple rules. The lines bounding a triangle, square or other plane figure included within straight lines are termed the *perimeter*.

The *circle*, Fig. 73, is a plane figure bounded by a continuous curved line, all points on which are equally distant from a point within called a *center*. (A) The bounding line is called the *circumference* of the circle. Any straight line drawn from the center to the circumference is called a *radius* (plural, *radii*) (A. F., A. C.), and any straight line drawn through the center across the entire figure forms a *diameter* (B.A.C.). An *arc* is a portion of the entire circumference. The *chord* of an arc is a straight line joining its two extremities; the *chord* is said to *subtend* the arc. The figure formed by two radii and their arc is called a *sector* (F.A.B.); the figure included between an arc and its chord is called a *segment*.

The circumference of a circle is equal to the diameter multiplied by 3.14159. This figure, 3.14159, is denoted by the Greek letter π and signifies the circumference of a circle whose diameter is 1. The *area* of a circle is determined by multiplying the square of the diameter by 0.7854.

The terms *sine*, *cosine*, *tangent*, *versed sine*, etc., are so frequently used in works on naval architecture that it is at least desirable that they should be fully understood, even though it is not proposed to apply the methods of calculation in which they are involved. In Fig. 73 is shown a circle, B.D.C.E., described about a center A.; and divided into four quadrants by the horizontal diameter B.C., and the vertical diameter D.E. The angle B.A.F. is the *complement* of the angle F.A.D., and *vice versa*; at the same time the angle B.A.F. is the *supplement* of the angle F.A.C. A.F. is a radius, prolonged indefinitely beyond the circumference. The line F.G., the perpendicular dropped from one extremity of an arc to the radius passing through the other extremity, is called the *sine* of the angle B.A.F. Similarly, the line F.H. perpendicular to A.D., is the *sine* of the arc F.A.D. The sine of an arc is also the cosine of the complement of the arc; thus F.G. is the cosine of F.A.D., and F.H. is the cosine of F.A.B. The straight line B.K., perpendicular to the radius A.B., and just touching the circumference at the point B., is the *tangent* of the arc F.A.B.; and the line A.K., drawn from the center, through one extremity of the arc, and intersecting the tangent through the other extremity, is the *secant* of the arc. The line D.I. is the tangent of the angle F.A.D., and A.I. is its secant; being at the same time the co-tangent and co-secant of the arc

F.A.B. The line G.B., that portion of the radius cut off from the sine, is the *versed sine* of the arc F.A.B.; and D.H. is the *versed sine* of the arc F.A.D., and the *co-versed sine* of F.A.B. The sine, tangent and secant of F.A.B. stand in the same relation to the obtuse angle F.A.C., the supplement of F.A.B.; as its sine, tangent and secant also.

[TO BE CONTINUED.]

Seawanhaka Corinthian Y. C.

ON BOARD FLAGSHIP SATANELLA, S. C. Y. C.
SEAWANHAKA HARBOR, MAY 20, 1899.

GENERAL ORDERS, NO. 1.

1. Yachts of the squadron will rendezvous in Seawanhaka Harbor, on the morning of Decoration Day, Tuesday, May 30, for the purpose of taking part in the eighth annual opening of the club house and station on Centre Island, Oyster Bay.

2. All yachts in the harbor will dress ship, on signal, at 12 M., and will be prepared to receive visitors from 3 to 6 P. M. There will be a meeting of captains on the flagship, on signal, during the forenoon.

By order of

COMMODORE ROUSE.

HERBERT L. SATTERLEE, Fleet Captain.

The club house at Oyster Bay will be opened informally for the reception of members and their guests, and the ferry service established on Friday afternoon, May 26, 1899.

On Tuesday, May 30 (Decoration Day), at 12 o'clock, noon, colors will be hoisted and saluted, and the club house placed formally in commission for the season. In the afternoon the first race of the season in the knockabout class will take place. On Tuesday evening, May 30, there will be a dance at the club house, beginning at 9 o'clock. For the accommodation of guests, a launch will leave the station float at 8:30 o'clock in the evening, returning as may be necessary. Members may obtain cards of invitation for their friends, extending the hospitalities of the club for the opening day, by addressing the chairman of the House Committee, at 19 East Twenty-second street. Dances will also be given at the club house on the evenings of June 17 and July 4. At all three occasions music will be furnished by Ossman.

Special Announcements.

(a) The ways for hauling small yachts proved a great convenience last year. They have been remodelled and placed in thorough condition, and are now available for use.

(b) A competent boat builder has been engaged for the fitting out, repairing and overhauling of boats and yachts, and the requisite facilities therefor have been established.

(c) Rope, paints, oils and varnish will be kept in store at the club boat house, and will be sold at regular prices. The club has also made arrangements with Messrs. Acker, Merrale & Condit, whereby, upon short notice, it will be able to furnish all necessary supplies for yachts at the same prices as in the city, with actual cost of delivery added.

(d) A supply of naphtha will be kept for sale on the club dock in a place convenient for launches. Water and ice for yachts will also be kept for sale.

(e) The club has purchased the 30ft. 10 H. P. naphtha launch Vixen, and she will be available for hire by members.

(f) The Post-Office Department of the United States has established a postal station at the club house, which will be known as "Seawanhaka, Nassau county, New York."

(g) The clay pigeon shooting grounds will be open for use, and guns may be hired and ammunition purchased at the club house.

By order of the Board of Trustees.

C. W. WETMORE, Sec'y,
30 Broad street, New York.

Programme of Races.

Season of 1899—No. 1.

Tuesday, May 30 (Decoration Day).—Races for 21 and 25ft. knockabout classes and club catboats.

Saturdays.—Series races for Seawanhaka knockabout class, and races for club catboats, on dates to be hereafter announced.

Saturday, June 24.—Annual race.

Monday, June 26, to Thursday, June 29.—Racing cruise to New London to attend Harvard-Yale regatta.

Monday, Wednesday and Thursday, July 3, 5 and 6.—Seawanhaka International Challenge cup trial races.

Saturday, July 15.—Roosevelt Memorial cup race.

Wednesday, Thursday, Friday, Saturday and Monday, July 26, 27, 28, 29 and 31.—Seawanhaka International Challenge cup match at Montreal, Canada.

Saturday, Aug. 26.—Race for Robert Center Memorial prizes.

Monday, Aug. 21 to Friday, Aug. 25.—Knockabout class match with Philadelphia Corinthian Y. C., at Oyster Bay.

Saturday, Sept. 9.—Autumn open race for selected classes.

Note.—Series races for the Seawanhaka knockabout class will be sailed under the same rules as during the season of 1898.

In view of the many changes of ownership which have taken place in this class, present owners are requested to advise the Race Committee at their earliest convenience, whether it is their intention to race regularly at Oyster Bay this season, and all yacht owners, intending to participate in the races on Decoration Day, are requested to send entries to the Secretary of the Committee, at the Oyster Bay club house, on or before Monday, May 29. The races will be called about 2 o'clock in the afternoon, and instructions will be found at the club house in the morning.

CHARLES W. WETMORE, Chairman,
30 Broad street, New York.

WALTER C. KERR,
26 Cortlandt street, New York.

CLINTON H. CRANE,
52 Broadway, New York.

JOHNSTON DEFOREST,
7 North Washington sq., New York.

CHARLES A. SHERMAN, Sec'y,
64 Leonard street, New York.

Race Committee.

The Quincy Cup.

WITH good information at hand concerning the four challengers and the new defender for the Quincy cup, some interesting comparisons are possible. The boats show quite a wide range in design, and some of them are on the "freak" order, and no mistake. The "scow" and the "flatiron" are much in evidence. Builder Hanley is reported as saying that if any one would build a "boat" for the class he could win the cup, "hands down."

Nevertheless, the new 21-footers are in a racing class, pure and simple, where speed is the main thing, and where the owners care little how much of the "freak" there may be in their boats, so long as they are fast. A "boat" might beat them, but it is an open question.

The following table shows the principal points of the boats:

	Length over all, ft.	Beam, ft. in.	Draft, ft. in.	Sail area, sq. ft.
C. D. Mower, c.b.	38	10	9	1,000
W. E. C. Eustis, fin.	39	10.9	3.9	1,000
Walter Abbott, c.b.	37	8	9	850
W. B. Pigeon, et al., c.b.	39	9.6	9	900
H. M. Faxon, c.b.	39	10.6	9	1,000

The Mower boat, although somewhat on the "scow" type, is more normal than any of the others. She has the largest proportion of sail to beam, and should be fast in light airs, as intended by her owner. The Eustis boat is the most powerful of the lot, and should show the best performance in a breeze. The Abbott boat is of light power and small sail, a "scow," with "flatiron" tendencies, while the Faxon defender is an extreme "scow" and the most powerful of the centerboards. The Pigeon boat is a compromise between several of the others.

There will be fun when the boats meet, and the provision concerning breakdowns in the agreement for the conditions of the races may not come amiss in view of light construction.

A conference of the challengers for the Quincy cup with the cup committee was held last Thursday afternoon at the Trade Club on Bedford street, J. S. Whiting of the committee presiding. The conference was held primarily on the request of W. E. C. Eustis, of the Beverly Y. C., for a change in the dates of the races to a later one in order that he might sail in some very important races in Buzzard's Bay scheduled for the same dates, but as all parties interested were present, several details of the races were considered and agreed upon.

In view of the fact that the dates for the races were early agreed upon by the Quincy Y. C., and C. D. Mower of the Lynn Y. C. the first challenger, and that any change to a later date would cause conflict with other Massachusetts Bay races already fixed, the committee felt compelled to adhere to the original dates. The first race will therefore be sailed Monday, July 24, and the races will follow on succeeding days until the series is completed.

The courses will be the same as last year, alternately windward and leeward, nine miles in length, and triangular, 12 miles in length, and will be laid so as to give at least 5½ ft. of water all over the course. The races will be sailed on as nearly high water as is possible. The time limit in all races will be three and a half hours.

Barring postponement, the races will be started as follows: Monday, July 24, 10:15 A. M.; Tuesday, July 25, 11:15 A. M.; Wednesday, July 26, 12:15 P. M.; Thursday, July 27, 1:15 P. M.; Friday, July 28, 2:15 P. M.; Saturday, July 29, 2:15 P. M. In case the races are continued into the following week the starting times will be mutually agreed upon by the contestants.

In case of accident to any of the competitors the judges shall have power to postpone the succeeding race, but no postponement shall be made for more than one race day.

Three guns will be fired in starting each race. The first will be a warning signal fifteen minutes before the start. The second will be the preparatory signal ten minutes after the warning signal and five minutes before the start. The third will be the starting signal five minutes after the preparatory.

There will be three judges, the Lynn, Beverly and Quincy clubs each choosing one.—Boston Globe.

The Yankee—Dominion Match.

SCARCELY a slanting sail has gleamed on the surface of White Bear Lake this year. There is little to be seen that indicates that one of the most important and significant seasons in the club's history is at hand and will formally open on May 30, Decoration Day. But good work is being done in a quiet way, out of sight of the general on-looker, but well understood by the yachtsman, who appreciates full well the fact that the dull preliminary work is essential if he proposes to make any record whatever.

The one sail that has come slanting around the point of the island is the sail of the much-talked-of Yankee, whose picture has been displayed in the yachting papers of the East. Yankee is making hosts of new acquaintances and many warm friends, although it must be confessed that there are but a sparse group of prophets to foretell a possible victory for her over Dominion. And yet the student of history knows right well that these things are in the knees of the gods, and Yankee may demonstrate that Saul was also among the prophets.

Is asked again and again what changes have been made in Yankee to put her in shape for the international race of June 12. She is not changed at all, for the basis of the agreement was that each yacht, Yankee and Dominion, should sail in the same form in which she sailed last season. Neither boat then is at liberty to make any changes of any importance, either in hull or rig.

Capt. Ordway, asked who would make up his crew on the eventful week of the racing, could answer as he did before, that he should select his men from a number of the club members who are going along with him. This live ballast is limited to 600 lbs., and four men. He will select his four from Messrs. Griggs, Ramaley, Murray, Drake, Douglass and Wann, all of whom are intending to go to Montreal for the races.

Eugene Ramaley will take Yankee on June 1, and Capt. Ordway and party will go in a private car over the Soo road June 7. This car has been offered by Mr. Stohr, of the Chicago Great Western road, and will serve as a hotel during the stay of the men, should they so desire. At

any rate the offer of the car has been accepted, and is rather a princely bit of courtesy on the part of Mr. Stohr, who is a member of the club, and a handsome sailor when you catch him on the dock.

The coming international contest is arousing greater interest in the East than in the West, which is something of an anomaly, since Yankee has never been further east than Wildwood. "Yankee" is already a household word, and although the majority of the clubs are inclined to view the challenge of the White Bear Y. C. as an act of temerity, they all admire the display of Yankee enterprise and courage and wish the Westerners speed and success.

The White Bear yachtsmen are not referring to Dominion as a "freak." Having challenged Dominion they are sufficiently consistent to refer to her as a yacht. When the word "freak" is used it behooves yacht owners to remember that it can be passed around.—St. Paul Dispatch.

The Knickerbocker Y. C. Annual Regatta.

To be sailed on Saturday, June 3, under the rules of the Yacht Racing Association of Long Island Sound. Open to yachts enrolled in any recognized yacht club.

Classes: Schooners, 65ft. class; sloops, cutters and yawls, 52ft. class; sloops, cutters and yawls, 43ft. class; sloops, cutters and yawls, 36ft. class; sloops, cutters and yawls, 30ft. class; special Newport 30ft. l.w.l. class; cabin catboats, 30ft. class; cabin catboats, 25ft. class; knockabouts, 25ft. l.w.l. class; knockabouts, 21ft. l.w.l. class.

The course for all classes will be from starting line off club house to and around Gangway Buoy and return, leaving same on starboard hand in turning. Distance, 14.5 nautical miles.

Yachts in starting will cross line from west to east, and in finishing from east to west.

Yachts must leave all Government buoys on proper hand, and must pass to the northward and westward of Stepping Stones Lighthouse.

STARTING SIGNALS.

First Signal.—The blue peter hoisted as a preparatory signal.

Second Signal.—A red ball hoisted for the start of schooner class.

Third Signal.—A white ball hoisted for the start of the 52ft. class of sloops, cutters and yawls.

Fourth Signal.—A blue ball hoisted for the start of the 43ft., 36ft. and 30ft. classes of sloops, cutters and yawls.

Fifth Signal.—A blue ball and a red ball hoisted for the start of the special 30ft. l.w.l. class of sloops.

Sixth Signal.—Two white balls hoisted for the start of the 30ft. and 25ft. class of cabin catboats.

Seventh Signal.—A red ball and a white ball hoisted for the start of the 25ft. l.w.l. class of knockabouts.

Eighth Signal.—A white ball and a blue ball hoisted for the start of the 21ft. l.w.l. class of knockabouts.

There will be an interval of five minutes between signals. Attention will be called to these signals by gun, and the time of starting of the several classes will be taken at the setting of signals. Weather permitting, the preparatory signal will be hoisted at 11 o'clock, A. M.

Prizes will be awarded in all classes in which one or more yachts sail the course and a second prize in classes in which there are five or more starters; should a yacht sail alone in her class, she will be entitled to a "sail over" prize of one-half the value of the regular prize.

Measurement Rule No. 11 is hereby suspended in classes above 30ft. racing length, but the official measurement of winning yachts in the 36ft., 43ft. and 52ft. classes of sloops, cutters and yawls must be furnished to the regatta committee before the prizes are given in those classes.

A tug flying the club flag will on the morning of the race leave Larchmont at 7 o'clock and proceed to College Point by way of New Rochelle and City Island for the purpose of towing yachts to starting line, and if found necessary, will return to City Island at about 9:30 o'clock to tow other yachts not ready or in sight on the first trip.

Steamer Favorite will accompany the yachts over the course, leaving foot of East Thirty-first street at 9:30 A. M., College Point 10:45 A. M.

Entries will close with the chairman of the Regatta Committee, Room 140, No. 1 Broadway, New York City, on Thursday, June 1, at 11 A. M.

O. H. CHELLBORG, Chairman.

H. STEPHENSON,

C. W. SCHLESINGER,

RODMAN SANDS,

F. E. BARNES,

J. O. SINKINSON, Sec'y.

Regatta Committee.

The Canada Cup.

THE designs for the Payne boat were received at Toronto on Saturday, May 13, and on Monday they were sent to Oakville, where Capt. Andrews will build the boat alongside of the McLeod 35-footer. Up to May 21 the Hanley 35-footer Genesee, had not sailed from Quincy, her sails not being ready. Members of the Rochester Y. C. are awaiting her in New York.

The following news comes from Chicago:

"Very quietly the members of the Chicago Y. C. are working on a scheme to bring to Chicago one of the fastest boats in the 35ft. class. If the deal goes through there will be a fifth boat in the trial races on the Fourth of July, and the newcomer stands a good chance of winning out and going to Canada to compete for the Canada cup.

"The boat they are after is the former 32-footer Eva, who holds the championship of Lake Erie. Under the new rules she comes within the 35ft. class, a change which will enable her to carry about 200 more sq. ft. of canvas. This boat has a string of championship pennants, enough for a dozen racing yachts. She was designed by Geo. Webster, of Hamilton, Ont., and is owned in Sandusky.

"Negotiations are under foot looking toward the purchasing of the yacht by a Chicago man. The would-be owner of Eva is not affiliated with any club at present, but he is anxious to get into the racing game. He has been advised to buy Eva, and he is now trying to close the deal. If the purchase is made the vessel will be added to the Chicago Y. C. fleet and will be entered in the trial races."

Larchmont Y. C. Races.

THE Larchmont Y. C. has announced the following programme of races for the season:

Saturday, June 17.—Spring regatta, open to all classes.
Tuesday, July 4.—Eighteenth annual regatta, open to all classes; special race for 21 and 25ft. knockabouts. Steamer *Albertina* for members and guests.

Larchmont Race Week, Saturday, July 15.—Open regatta for all classes, special race for schooners in one class, race, special 30ft. class; race for 21 and 25ft. knockabouts.

Monday, July 17.—Race for schooners in racing trim in one class, race for classes D and F of schooners, race for Class K, 51ft. R. L.; race for 21 and 25ft. knockabouts.

Tuesday, July 18.—Four-oared gig race for "Hen and Chicken Colors," presented by ex-Commodore Gillig; two-oared gig race for "Dauntless Colors," presented by Mr. H. B. Seeley; dingy race for "Execution Colors," presented by Mr. H. B. Seeley; race for naphtha and alcohol vapor launches exceeding 21ft. l.w.l.; race for naphtha and alcohol vapor launches 21ft., l.w.l., and under; tub races and water sports.

Wednesday, July 19.—Open regatta for all classes, race for special 30ft. class, race for 21 and 25ft. knockabouts.

Thursday, July 20.—Race for Class K, 51ft. R. L.; race for Class M, 36ft. R. L.; race for 21 and 25ft. knockabouts, race for cabin cats all in one class, with time allowance.

Friday, July 21.—Race for Classes B, C, and D of schooners, one class; race for Class F of schooners, race for Class K, 51ft. R. L.; race for Class M, 36ft. R. L.; special race for yawls under 43ft. R. L., all in one class.

Saturday, July 22.—Open regatta for all classes, special race for schooners in one class, race for special 30ft. class, race for 21 and 25ft. knockabouts. During race week should the owners of two or more yachts in any one class not provided for, desire to race, the regatta committee will, upon application, provide for same, and suitable prizes will be awarded.

Saturday, Sept. 2.—Race for Class F of schooners, race for Class K, 51ft. R. L.; race for Class M, 36ft. R. L.; race for special 30ft. class, race for Class S, 20ft. R. L.; race for Class T, 25ft. R. L.; race for 21 and 25ft. knockabouts.

Monday, Sept. 4 (Labor Day).—Fall regatta open to all classes, race for special 30ft. class, race for 21 and 25ft. knockabouts.

Saturday, Sept. 9.—Race for Larchmont cup for schooners, race for Class F of schooners, race for Class K, 51ft. R. L.; race for Class M, 36ft. R. L.

Com. Postley has appointed Philip T. Dodge, schr. *Clorita*, as Vice-Com., the office being vacant since the last election.

Shamrock.

THE Yachting World of May 12 gives the following details of the new *Shamrock*:

We are informed that the following are the chief measurements of Sir Thomas Lipton's *Shamrock*: Length over all, 130ft.; L.W.L., 89ft.; beam, 24ft. As already intimated in the *Yachting World*, Messrs. Thorneycroft experienced great difficulty in the working of the manganese with which the challenger is to be plated. By degrees, as the men became accustomed to the nature of the metal, this difficulty was to a large extent overcome, and for some weeks now the work of shaping and fitting the plates has been going forward slowly, but in a fairly satisfactory manner. The whole plans of the boat have never been given out to the workmen in the Chiswick Yard, but the work has gone forward there in sections. Each section was shaped and fitted separately and bolted into position, being afterward taken down and sent to the building yard at Poplar to be finally put together and riveted there.

The keel was also cast there, and within the last week or two an unexpected difficulty has been encountered in the boring of holes for the keel bolts. The keel was cast solid in one block of lead, weighing 89 tons. This has to be bolted to the frames, and for this purpose it is necessary to drive some eight or nine holes right through the solid block of lead from top to bottom. The difficulty of this obstacle will be understood when it is stated that the keel tapers in depth from 2ft. 2in. to 4ft. 6in. The great weight of the mass makes it impossible to bring it to the proper boring machines, and another difficulty is created by the nature of the metal. Instead of coming clear out of the hole the lead has a tendency to break off and choke the bit, and this has already delayed the work much longer than was anticipated. A boring machine of novel design has recently been got to work, and better progress is now being made. It is, however, manifestly impossible that the yacht can now be launched this month, as was at first intended; and it is feared that June will be well advanced before she is ready for the water. This fact will cause a modification of the plans already made for her trials, and it is quite probable now that, once afloat, she will only be sailed sufficiently to give the skipper and crew some idea of what handling she needs, and will then proceed to the special fitting out required for her trip across the Atlantic.

Atlantic Y. C.

THE Atlantic Y. C., the first club to observe Decoration Day as the formal opening of the yachting season, is making special efforts this year to entertain its members and the racing men. The following official programme has been issued:

"The vice-commodore will be in charge of the anchorage at the club house on Decoration Day, May 30, 1899.

"A gun will be fired from the *Ramona* at half-past ten o'clock A. M., upon which signal the club burgee will be hoisted on the flagstaff at the club house and will then be saluted by all the yachts present."

The Regatta Committee of the club "requests the announcement that on Decoration Day a very limited number of tickets will be issued, permitting members and ladies in their company to be present on the Regatta Committee boat, so as to enable them to view the morning ceremonies at the club house and later to accompany the yachts over the course on the occasion of the regatta.

"The boat will start at 9 o'clock A. M. from a pier in New York, to be indicated on the ticket, and will stop at the club house at Sea Gate, both going and returning. On the return abundant time will be allowed for dinner at the club house, before returning to New York."

The race is open to all classes enrolled in the club. All yachts will be classified according to Rule 4 of the Racing Rules.

Cabin, schooner, sloop, cutter and yawl yachts will be rated for racing length under the girth measurement; mainsail yachts will be rated for time allowance by load waterline length; cabin and open mainsail yachts will sail in separate classes, as follows: Classes S and T, cabin, over 21ft., as one class; Classes V and W, cabin, 21ft. and under, as one class; Classes S and T, open, over 21ft., as one class, and Classes V and W, open, 21ft. and under, as one class.

A prize of \$25 in value or cash will be awarded to the winning yacht in each class over 36ft. racing length, and of \$20 to the winning yacht in each class 36ft. and under.

Entries must be made with Colonel David E. Austen, chairman of the Regatta Committee, No. 57 Chambers street, not later than 10 o'clock A. M., Saturday, May 27, or at the club house, Sea Gate, not later than noon Monday, May 29.

Commodore Frederick T. Adams, under general orders No. 1, has appointed Thomas L. Watson Fleet Captain and Wisner R. Townsend Fleet Surgeon.

Corinthian Y. C., of Philadelphia, Opening Race.

ESSINGTON—DELAWARE RIVER.

Saturday, May 20.

THE Corinthian Y. C. of Philadelphia opened the season on May 20 with due ceremony, a large fleet of yachts dressing ship on signal from the flagship *May*, Com. Van Rensselaer, anchored off the club station, Essington. Many members and guests were present, and a reception was held on board the flagship. During the afternoon a race was sailed by the one-design knockabouts, resulting as follows:

	Finish.	Elapsed.
Kid	4 20 30	0 54 30
Grille	4 31 06	0 56 06
Fareeda	4 31 35	0 56 33
Fly	4 31 40	0 56 40

A fresh N.W. wind made a very exciting race.

The club has recently elected the following members: Active, Herbert Hart Boyd, Evans R. Dick, William J. Baird, Albert C. Wood and Kern Dodge; non-resident, H. Hugh Art Laughlin, of Pittsburg, and Meridith Bailey, Jr., of Ecuador, South America; naval member, Lieutenant Commander F. A. Miller, U. S. N.

The full racing programme for the season is as follows: May 20.—Opening day races for schooners, knockabouts and larks, for prizes offered by the commodore.

May 30.—Memorial Day special races.

June 3.—Annual races for all classes.

June 6 and Following Week.—Interclub races at Essington for knockabouts between Seawanhaka Corinthian Club of New York, and Corinthian Club of this city.

July 29 to Aug. 5.—Annual cruise to Long Island Sound.

Aug. 28 to Sept. 2.—Return races knockabout classes with Seawanhaka Corinthian Club at Oyster Bay, L. I.

Sept. 4.—Annual autumn races for all classes.

The first and second series of Saturday races for the knockabout and lark classes will be arranged by the committee as soon as the boats are named and the season opens.

Huguenot Y. C. Opening Race.

NEW ROCHELLE—LONG ISLAND SOUND.

Saturday, May 20.

THE racing season of 1899 was opened in New York waters by the Huguenot Y. C. with a special race for sloops and yawls in the 30ft. class, the 21ft. knockabouts, the Seawanhaka one-design knockabouts, and the club dory class. The course was from off Whortleberry Island past the red buoy on Hen and Chickens, the red and black buoy off Execution, and home, two rounds making seven and three-quarter miles, naut. The day was cool and cloudy, with a fresh N.W. wind, making the last leg a beat. Possum had no competitor, and Midge split her mainsail at the start, so that she was compelled to withdraw. *Mongoose* was sailed by her new owner, Hazen Morse, while F. B. Jones sailed her sister boat, last year's *Indianola*, now renamed *Spindrift* by her new owner. *Spindrift* was well ahead at the end of the first round, but her skipper withdrew under the impression that but one round was to be sailed, the race going to *Mongoose*, who sailed the full course. The times were:

	Start, 3:15—Yawls, 30ft.	Finish.	Elapsed.
Possum, W. H. Bavier.....	3:15	4 30 00	1 15 00
Start, 3:15—Sloops, 30ft.			
Bingo, W. B. Greeley.....	3:15	4 46 26	1 31 26
Haydee, A. D. Morstadt.....	3:15	4 34 05	1 19 05
Start, 3:25—Knockabouts, 21ft.			
Mongoose, Simeon Ford.....	3:25	4 39 36	1 14 05
Spindrift, S. C. Pirie.....	3:25	Did not go course.	
Start, 3:25—One-Design Knockabouts.			
Thelga, A. P. Thayer.....	3:25	4 46 00	1 21 00
Midge, F. W. Boyer.....	3:25	Disabled.	

The winners were Possum, Haydee, *Mongoose* and Thelga.

None of the dories started, but toward the finish one went out, and in a gust was run ashore on the sandbag off Whortleberry Island, her crew getting a wetting. Before the start the club was formally declared in commission for the season.

Mayita II.

THE new steam yacht *Mayita II.*, designed and built by C. L. Seabury & Co., for Louis Bossert, of the Jamaica Bay Y. C., was launched at Morris Docks on May 16 in the afternoon. The yacht is 135ft. over all, 110 ft. l.w.l., 16ft. beam and 6ft. draft, of composite construction, with single skin below and double above water, and twin screws. Her engines are triple expansion, 8½, 14 and 23in. by 12, with Seabury safety watertube boilers. She is expected to make 16 miles. The entire work, hull, machinery, boats, etc., was done by the Gas Engine and Power Company, and C. L. Seabury & Co., the combined firm.

Columbia.

THE plating of *Columbia* was completed last week, and most of the riveting has been done. The deck planking was redressed last week and carried across the road to the building shops. It is 2½ by 3in., and 21ft. long. The work of polishing the plating by means of flexible shafts and brushes has begun, but it is not yet known whether the top sides will finally be painted. The new steel mast is nearly completed, but it will be shipped in *Defender* and not *Columbia*. The spars for the latter arrived from Boston last week.

The Boston Globe gives the following measurements of *Columbia*: Length over all, 131ft. 6in.; l.w.l., 89ft. 6in.; beam, 24ft.; draft, 20ft.; mast, 107ft. 6in.; deck to hounds, 77ft.; boom, 109ft. 8in.; gaff, 70ft.; bowsprit, 38ft.; top-mast, 64ft.; spinnaker boom, 73ft. These spars call for a measured area of about 13,800 sq. ft. A dozen of *Columbia's* crew have gone to New Rochelle to work on her steam tender, *St. Michaels*.

The Inland Route to Florida.

Editor *Forest and Stream*:

Is it possible to take a catboat to Indian River, Florida, without much outside sailing. I know the way through the canals and Chesapeake to Pamlico Sound, but don't know if the remainder of the distance is practicable. Is there any account of such a cruise to be purchased. Any information would be much appreciated by

CATBOAT.

[Very complete and accurate information concerning the inside route to Florida was published in the *FOREST AND STREAM* of Dec. 4 and Dec. 11, 1897.]

YACHTING NEWS NOTES.

The Regatta Committee of the Williamsburg Y. C. has issued the annual programme for the season, as follows: May 30, twenty-eighth annual regatta over the regular triangular course on the Sound off the club house, followed by a reception; June 11, class race for sloops for special prizes; June 16, class race for catboats; Aug. 13, class race for sloops for special prizes; Aug. 27, ladies' day regatta, all boats competing to carry at least one woman as steersman and crew, also tub races and swimming races for club prizes; Sept. 10, class races for catboats for club special prizes; Sept. 24, fall regatta; July 1 to 4, annual cruise to Cold Spring Harbor and return; Aug. 6, chowder and sail at Little Neck Point; Sept. 2 to 4, cruise and chowder.

The third regular meeting of the New York Y. C. was held on May 18, with Vice-Com. Ledyard in the chair. The following members were elected: William P. De Witt, Frank H. Partridge, Francis Skinner, Jr., Walter C. Hubbard, James W. Tappin, Alfred G. Vanderbilt, Lieutenant A. C. Dieffenbach, U. S. N.; Lieutenant Frank T. Evans, U. S. N.; James J. Higginson, Joseph B. Thomas, John D. Cheever, J. Boulton Simpson, Charles Warner Shope, G. B. Linderman, Walker Breese Smith, Charles W. Bowring, Edward J. Bergen, Henry A. Rogers, Lieutenant William Winder, U. S. N.; John Rutherford Buchan, Price Collier, Frank Bowne Jones, Ashbel P. Fitch, Lieutenant Leon S. Thompson, U. S. N.; Dr. Lloyd W. Curtis, U. S. N.; Lieutenant Commander L. L. Reamey, U. S. N.; General George B. Williams, R. H. Wilbur, Warren A. Wilbur, Lieutenant John F. Hubbard, U. S. N.; Henry W. Poor, Lieutenant Robert K. Crank, U. S. N.; Frank J. Dupignac, H. Durant Cheever, Dr. John Vanderpoel, Albert C. Bostwick, Frank Hubbard and George D. Morgan. Com. Morgan has reappointed J. Beaver Webb as Fleet Captain for 1899.

Mayita I., steam yacht, has been sold by Louis Bossert to Dr. W. Seward Webb, who will use her on Lake Champlain in place of *Elfrida*, sold last year to the Government.

Punjaub, steam yacht, has been sold through the G. E. & P. Co., by F. L. Masury to Messrs. E. C. Schaefer and F. Uhlman, of New York.

Triton, schr., has been sold by W. A. Wilkins, of Savannah, to J. W. Martin, Cor. Y. C., of Philadelphia.

Peroiti, sharpie, has been sold by F. W. Wilson to T. F. Day.

Capt. Hank Haff has been engaged for the season by Com. J. M. Forbes, as skipper of Volunteer, and is now at Wood Holl fitting her out.

Albatross, steam yacht, has been sold by Jacob Ruppert to J. H. Carstairs, of Philadelphia.

Rhouma, steam yacht, George Bullough, arrived at Key West on May 16 from Charlotte Harbor. She has been on a cruise, from the Clyde to the West Indies, during the winter.

F. B. Jones, of New York, has recently negotiated the following sales of yachts: Sloop *Irex*, sold by T. J. Preston to John N. Meyer and Cord A. Meyer; sloop *Whitby*, sold by H. H. Tyson to a member of the Bridgeport Y. C.; yawl *Sea Gull* (formerly *Gaviota*), sold by J. Fred Ackerman to H. N. Richards, of Boston; sloop *Vorant* L., sold by Charles A. Appleton to Dr. E. L. McGinnis; alco-vapor launch *Mareille*, sold by W. H. Burgess to Robert P. Doremus; racing catboat *Presto*, sold by H. R. Hatfield to E. Y. Nelson, of the Tappan Zee Y. C.; sloop *Tally Ho*, sold by M. S. Bentham to Edward J. Anderson, of Providence; Seawanhaka knockabout *Golightly*, sold by E. Hope Norton to A. P. Thayer, New York Athletic Club.

On May 12 a new yacht club, called the Arlington Y. C., was organized at Eddystone, Pa., on the Delaware River.

The Oconomowoc Y. C. and the Country Club of Oconomowoc have gone into a partnership this season for the purpose of conducting a carnival of sports at the summer resort. They have issued a programme of the sports which includes all the games usually in vogue at summer resorts, and from July 24 to 31 are to hold the largest affair of the kind given in the West. The yacht club being the senior organization, has chosen the first week of the programme. The club will hold over the course on Lake La Belle the series of races of the Inland Lakes Yachting Association for one-raters. Four prizes are to be sailed for in these races. The programme for the week of yachting is as follows:

First Day.—O. Y. C. challenge cup.

Second Day.—Green Lake Challenge cup.

Third Day.—Pabst challenge cup and the Dupee cup.

Fourth and Fifth Day.—Continuance of the races for the cups offered for the first three days.

Sixth Day.—Open for finals and races postponed for reasons such as lack of wind or bad weather.

On Monday the Country Club will take hold, the programme being as follows:

First Day.—Men's golf team match, open to teams from visiting clubs, 18 holes, followed by medal play, 9 holes.

Second Day.—Mixed foursomes, handicap, 18 holes; women's putting contest and men's approach and putting trials.

Third Day.—Men's handicap, medal play, 18 holes; women's handicap, medal play, 18 holes; followed by men's driving contest.

Fourth Day.—Gymkhana races, open to members and visitors; bicycle races, pony races, caddie races, and foot races.

Fifth Day.—Open air horse show, including the following classes: Pony carts, pairs to mail phaeton, spider, or pair break, tandems, four-in-hands to coaches or breaks.

Thomas Clapham, of Roslyn, has just completed a racing yacht for the 20ft. class for C. E. Silkworth, of Brooklyn, who will name her Spunk.

The Macatawa Bay Y. C., of Grand Rapids, Mich., will build a large club house at its station, on the south shore of Beach Lake. The club included members from Chicago and Grand Haven.

The Penataquit Y. C. has announced the following fixtures: May 30, spring club race; July 4, annual club regatta; July 15, snipe class race; July 22, race for half-raters; Aug. 5, annual open regatta; Aug. 19, race for half-raters; Sept. 2, race for half-raters; Sept. 4, fall club regatta. In the races of May 30, July 4, Aug. 5 and Sept. 4, there will be a special class for knockabouts. The regatta committee includes Messrs. H. C. Hepburn, John R. Suydam, Geo. B. Magoun, Alden S. Swan and Chester B. Lawrence.

We stated last week, under the head of "Yacht Intelligence," that Rainbow, schooner, was a probable starter for the Heligoland race, June 19. Her owner, however, has no idea of competing in that race. Rainbow will be raced on the Thames, and go on to the Clyde for the fortnight's racing there. It will be regretted that Gleniffer, the schooner building from Mr. G. L. Watson's design for Mr. James Coats, who raced Marjorie cutter with such success, is not likely to be raced. She is 14ft. on the load waterline and 26ft. 9in. beam. Her sail spread will be about 14,000 sq. ft., or about 500 sq. ft. more than Rainbow has, the latter being 11ft. on the load waterline, with a beam of 24ft.—The Field.

The Decoration Day race of the Indian Harbor Y. C. will be open to the 21ft. knockabout class and the one-design dory class, the preparatory being at 2 P. M., and the start at 2:05 for the knockabouts, and 2:10 for the dories. Entries must be made by May 29 to F. B. Jones, 29 Broadway, New York.

Mr. H. C. Roome, New York Y. C., accompanied by his wife, has arrived at Williamsport on their novel yachting trip through inland waterways to the Mississippi. They will proceed to Cumberland as soon as the break on the fourteen-mile level of the Chesapeake and Ohio Canal is repaired. Mr. Roome sailed from Greenport, Long Island, on the yacht Waikiki on April 17, passing through the Raritan and Delaware rivers and canals to Chesapeake Bay and up the Potomac River to Washington, where the yacht was transferred to the Chesapeake and Ohio Canal. It is the intention on reaching Cumberland to load the yacht on flatcars and transport her by rail to the Ohio River, and continue the cruise down that river and up the Mississippi and other waterways into Manitoba. In making the cruise on a wager, which he fears he may lose, for the reason that the yacht is too large to pass through the tunnels on the railroad route to the Ohio. Waikiki is a 54ft. naphtha launch of 9ft. beam.—New York Tribune.

Enterprise, steam yacht, has been chartered by A. J. Cassatt to E. T. Hunt, of New York.

Noumahal, steam yacht, J. J. Astor, arrived at New York on May 21 from her Mediterranean cruise, after first calling at Newport. She has been absent since Feb. 4. Mr. Astor and his party left the yacht abroad and returned by steamer.

It has been announced that Mr. W. G. Jameson was the purchaser of the cutter Britannia by private treaty; she was consequently withdrawn from Marvin's auction sale at the Shipping Exchange, Billiter street. There have been many sales of yachts at this exchange, but prices favorable to the vendors have seldom been realized, and the sale of yachts on Wednesday last was no exception to the rule. The yacht which fetched the most satisfactory price was the Red Eagle (lately owned by a French nobleman under the name of L' Aigle). The yacht was built by Messrs. Ramage and Ferguson in 1888, and is still classed *100 A1 at Lloyd's. She is of 305 tons, and produced \$5,800, or about \$19 per ton. Formosa, cutter, 102 tons, built by Mr. Michael Ratsey in 1878 for Mr. Francis Sloane Stanley, fetched \$1,100—sums considerably under breaking up price. Feronia, schooner, 50 tons, built in 1872 by Messrs. Hansen for Mr. F. B. Winsor, went for \$420; Songstress, 15 tons, \$250, and Godiva, 10 tons, \$75; altogether the six yachts realized \$8,745.—The Field.

Valiant, centerboard cutter, designed by F. W. Martin in 1895, has been rebuilt into a keel boat of 7ft. 6in. draft with 2,250 sq. ft. of sail, her new measurement being just under 40ft. R. L. She is owned by W. A. Stickney, of St. Louis, who will sail her from Harbor Point, Mich. She is enrolled in the Chicago and Columbia yacht clubs.

Mystic, steam yacht, was driven ashore on April 6 off the Honduras coast, near Lagoon Ceiba in a northern of unusual severity. Her party included Augustus A. Yates and Thomas J. Allen, of Philadelphia; William Holk, of Michigan; Louis Freiburger, of Chicago, and Dr. and Mrs. F. T. B. Fest, of Detroit, with their two children, and the crew. All hands reached shore, but found it uninhabited. They walked many miles, suffering for want of food, until an Indian village was reached. On the way one of the children died from exhaustion. The party

procured canoes at the village and paddled to Port Burchard, whence they took the steamer Foxhall for New Orleans.

If You Want the Whitest and Best

WHITE LEAD use "ENGLISH B. B." Of all paint dealers and of J. Lee Smith & Co., 59 Frankfort street, and F. W. Devoe & C. T. Reynolds Co., 101 Fulton street, New York.—Adv

Canoeing.

The Passing of the Canoe.

It would perhaps be unjust to the poet, Mr. Albert Strange (Cherub), to say that there is more truth than poetry in the following lament, which we reprint from the Yachtsman. At the same time there is truth enough, sad to say, in that the canoe, as canoeists first knew it, has passed away, and apparently beyond recall. We have nothing to say against the craft which have superseded it, many of them are superior to the canoe for certain popular uses; but we do regret that the old "paddleable" or "paddling and sailing" canoe, and the pastime of canoe cruising as introduced by McGregor, are practically extinct in America and Great Britain.

Mr. Strange has sketched most cleverly, and but too truthfully, the course of evolution which has at last established the miniature yacht in place of the canoe.

(With an apology to the Shade of Longfellow.)

Sadly mused the old canoeist,
Sitting in his winter wigwam
(Wigwam built of bricks and mortar,
Highly rented, highly rated)—
Musing, as he read his Yachtsman,
On the changes time was making,
In himself—and in canoeing.
Gone—he mused—the days delightful,
When we sallied forth with paddle
(Tiny sail and trusty paddle),
Apron-mackintoshed and cosy,
In our dainty Rob Roy cruiser,
Bound for nowhere in partic'lar,
Down the rapid, down the river,
Out to sea—no matter whither:
When we couldn't sail, we paddled,
When we couldn't paddle, pushed her
Over bars, and over sandbanks,
From the river to the railway,
From the railway to the carrier,
Over mountains—over deserts;
Nature set no bounds to journeys
In the dainty Rob Roy cruiser.

Eastward—on the muddy Humber,
On the wild and rapid Humber,
Where the tide runs like a millrace,
And the wind blows like the devil—
Dwelt a man who loved canoeing
In the dainty Rob Roy cruiser.
Tried it oft, and found it dampish,
Found it moist and dem'd unpleasant
When the wind and tide together
Struggled, fought and made confusion.
So he built another cruiser,
Shorter, deeper, wider, stiffer,
Called her Cassy—but he guessed not
That this Cassy made commencement
Of the end of all canoeing
In the dainty Rob Roy cruiser.

On the Mersey, farther northward
(Mersey, wide, and deep and rapid),
Where the "Dicky Sams" did gather,
When from 'Change they were released,
Sailed from Eastham to New Brighton,
Round the Rock and into Hoylake,
Even unto Hilbre Island—
Unto far-off Hilbre Island,
In the dainty Rob Roy cruiser.
Here, as on the muddy Humber,
Where the winds and tides do wrestle,
Very lumpy is the water:
Very damp the Rob Roy cruiser.
Found the Dicky Sams with sorrow,
Until Sam, the Vital Sparker,
Built them something larger, deeper,
Drove a long nail in, and clench'd it
In the Rob Roy cruiser's coffin.

Yet the Thames remained quite faithful
To the dainty Rob Roy cruiser
(Altered in some minor details),
Faithful in the Putney district
Or on Hendon's raging waters.
Now and then they went "below bridge,"
Even went across the ocean,
To the land of Yankee Doodle
Went the heavy Rob Roy cruiser.

Full of centerplates and shot-bags,
Balance lugs with lots of halyards,
Stiff and slow and very stately,
Oh, so slow! The lively Yankee—
Standing-rigged and sliding-seated,
Sailed around the Rob Roy cruiser.
Round the stately Rob Roy cruiser.
Left her far away to leeward,
Left her, while her British owner
(Stiff and slow and very stately)
Gazed in wide-eyed consternation
As the Yankee flyers vanished,
In the dim and misty distance.
Still, in spite of demonstration
By the Cassy, by the Ethel,
Thirty inches was the limit
Of the breadth of beam for cruisers,
Sliding seats were vile contraptions
Nothing but machines would wear 'em,
And the honest Rob Roy cruiser
Only fit for British sailing.

Notwithstanding pleading, coaxing,
All the sailors left canoeing.
Nearly all the cruising sailors
Went a-yawling, went in "raters,"
And the dainty Rob Roy cruisers
Slumbered in the dusty boat-house
All forgotten—disremembered,
Lost, neglected, out of fashion.
While the waters teemed with Ethels,
Cassys, Vikings, Tavies, Spectres,
Devas, Cherubs, Daisies, Wa Was,
Yawls of various sorts and sizes,
Whilst the dainty Rob Roy cruisers
Slumbered in the dusty boat-house.
Only skipper Bartley faithful
Skipper B. and J. G. Porter,
Only they remained faithful,
Even Tredwen built a Bargeyot.
* * * * *

Then arose the mighty Baden—
Baden P. the special pleader,
Known wher-e'er was known canoeing
He, the author, he the parent
Of a hundred Nautiluses
(Gentle printer, mind the spelling,
Prithee, do not make it lasses),
Greatly honored by the nation,
Clothed in silk—the special pleader—
Counsel for the Gracious Lady
Who benignly ruleth o'er us,
Mighty man with Pen and Paddle.
Cocksure, like the great Macaulay,
Fathoms long his disquisitions
In the Field about canoeing.
Week by week all special pleading
For the bantlings of his bosom
For the many Nautiluses.
So he rose and took his battens,
Took his splines, and weights, and battens,
Drew him out a lifting bulb plate
Yellow metal—most alarming,
Like the very stiffest problem
In the Second book of Euclid.
Over this he drew a sheer plan
Most unusual in profile
(Profile made to match the author),
Threw away the thirty inches,
Thirty sacred to the Rob Roy.
Gave her three-foot six for stiffness
(Just about the width of Cassy).
Sixteen foot in length he gave her
With an under-body rudder.
Simply awful in its cunning,
Sort of thing that wizards play with:
Waggling fore and aft, and sideways.
Then he drew a silken sail plan,
Roller jib and furling topsails,
Solid silver cleats and fair leads,
Solid silver (plated) anchors,
Golden aneroids and watches,
Nothing less than these would serve him,
Nothing less than precious metals
Decked the darling of his fancy
(Men who can't afford to do it
In this very swagger fashion
Have no right to go canoeing).

When the R. C. C. were gathered
Round the glowing winter camp-fire,
In their wigwam new and spacious
Somewhere near to Putney Station:
Forth he drew his rolls of paper,
Showed the plans of this new cruiser,
Exercised his wit forensic,
Dazzling in its flowing beauty.
Told them she would lick creation—
Sail, when raters struggled vainly—
Struggled vainly 'gainst the tempest.
If they longed to go a-Waleing
In the far-off Bristol Channel,
Where the waves are tetrahedral
And of magnitudes appalling—
(If you don't believe this statement,
See the number of the Yachting
Monthly, where the author's picture
Shows it was on Easter Monday)—
They could do it in a cruiser
(Only in this kind of cruiser,
Not the dainty Rob Roy cruiser).

So convincing were his statements—
Statements crammed with special pleading—
That this gold and silver cruiser
Seemed to them a thing of beauty.
Even Linton Hope was captured,
Thought there might be something in it.
Linton—who designed the Kismet—
Who designed the flying Kismet—
Then De Quincey, then the others,
All were captured by the pleader.
All but Laws—the unbelieving
Laws—who didn't seem to see it.
Thought the Prucas vastly better
(Though he lost it on the voting).
Thus the dainty Rob Roy cruiser,
At this last and bitter ending,
Silently received her deathblow
From the authors of her being.
Vanished from all earthly waters
To the kingdom of the sunset—
To the kingdom of the shadows—
Went to join Rob Roy Macgregor
Sitting in his ghostly wigwam.

CHERUB.

The Forest and Stream Publishing Co. are the largest publishers and importers in America of Books on Outdoor Sports. Their illustrated descriptive catalogue will be sent free on request.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

June 6-9.—Sioux City, Ia.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.

June 7-8.—Crawfordsville, Ind.—Indiana Trap-Shooters' League tournament, under auspices of Crawfordsville Gun Club.

June 10.—Princeton, N. J.—Yave vs. Princeton.

June 13-14.—Grand Forks, N. D.—Fifth annual shoot of the North Dakota Association.

June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 14-15.—Lewiston, Ill.—Lewiston Gun Club's tournament.

June 15.—McMumber, Sec'y.

June 20.—Ogden, Ill.—Ogden Gun Club's annual tournament.

June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

June 21-23.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 22.—Sherburne, N. Y.—Sherburne Gun Club tournament.

June 22.—Paddiford, Sec'y.

June 27-29.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club, Wopsonnock Heights. G. G. Zeth, Sec'y.

July 1.—Sherbrooke, P. Q.—Annual tournament; targets; Dominion Day; open to all amateurs. Chas. H. Foss, Sec'y.

July 1-2.—Milwaukee, Wis.—Grand tournament of Milwaukee Gun Club, in Carnival Week. S. M. Du Val, Sec'y.

July 4.—Pawling, N. Y.—All-day tournament of the Pawling Rod and Gun Club; targets.

July 4.—Hastings, Neb.—Hastings Gun Club amateur shoot; \$150 added. W. S. Duer, Vice-President.

July 18-20.—Little Rock, Ark.—Arkansas State tournament.

July 19-20.—Providence, R. I.—Interstate Association's tournament, under auspices of the Providence Gun Club. R. C. Root, Sec'y.

Aug. 9-10.—Portland, Me.—Interstate Association's tournament, under auspices of the Portland Gun Club. S. B. Adams, Sec'y.

Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

Oct. 6-7.—Pawling, N. Y.—Tournament of Pawling Rod and Gun Club; target and live birds.

First and third Fridays of each month.—Watson's Park, Burnside, Ill.—Semi-monthly contest for Montgomery Ward & Co.'s diamond badges.

DRIVERS AND TWISTERS.

The regular monthly shoot of the Pawling Rod and Gun Club will be held on Saturday of this week. The members' cup handicap (point system); 50 targets; 50 cents entrance; the handicaps will be shot up, and in event of tie for any of the 5 points—those having less than 6 handicap to shoot at 6 targets, those having 6 to 11 handicap to shoot at 8 targets—those having 11 to 15 handicap to shoot at 9 targets—those having over 15 handicap to shoot at 10 targets. The \$5 cash handicap is at 25 targets! 50 cents entrance; open to all; high man to win; handicap arranged before event is shot, but not given out until event is over. Ties decided at option of contestants. Sweepstakes to follow. H. Nelson, captain.

The Worcester Sportsmen's Club have arranged to hold a tournament at targets May 30, at their grounds, to reach which the shooters will take the Greenville electric cars and stop off at Huntington avenue. All sweeps optional. Shooting at 9:30; programme events begin at 11:30. There are eleven events on the programme, eight of which are at 10 targets, six of which are 70 cents entrance; the other two, \$1.20 entrance. There are two at 20 targets, \$1.40, and two at 15 targets, 80 cents entrance. The thirteenth is a miss-and-out for a purse of \$10, divided into five parts, \$3, \$2.50, \$2, \$1.50 and \$1. Dinner served on the grounds.

The programme of the City Park Gun Club, New Orleans, La., to be held on May 26 and 27, at the club grounds, City Park, has eight events, two each of 10, 15, 20 and 25 targets, respectively; 50 cents, 75 cents, \$1 and \$1.25 entrance. At 2:30 each day the Wilcox trophy cup will be shot for. No handicap; everybody invited. Target, 2 cents. Shooting begins at 9:30. Ten per cent. deducted from each event, which goes to the three high guns shooting through the entire programme.

The contest between the Princeton University Gun Club team and the New Brunswick team, held at Stockton Field, resulted in a victory for the former by the score of 101 to 94. The scores were: Princeton—Elbert 22, Chidester 16, Cannan 14, Jones 16, Layton 15, Young 18. New Brunswick—McDowell 18, Mundy 14, Burk 13, Oakley 18, Beloff 17, Voorhees 14.

On Wednesday of this week the contest for the championship of New Jersey takes place at Elkwood Park, Long Branch, N. J., between Messrs. Phil Daly, Jr., holder, and T. W. Morley, challenger. Same day and place also is a match at 50 live birds, \$100 a side, between Messrs. P. F. Woodard and Dr. J. G. Knowlton. There will be targets and sweepstake shooting all day.

The programme of the New York State shoot, a review of which is published elsewhere in our trap columns, provides an exceedingly attractive list of purses and prizes. Other programmes which also are reviewed have lists of good things to tempt the shooters and reward their skill, all of which will be plain to him who reads them.

On Decoration Day, May 30, there will be a 25 live bird handicap, \$10 entrance, birds extra, on the grounds of the Lyndhurst Shooting Association, Mr. T. W. Morley, manager. Other events will be arranged to suit the pleasure of the shooters.

Mr. W. R. Crosby, in the long competition at St. Louis, in the E. C. cup event, came out first, with a record of 265 targets out of 300 shot at. Full details will be found in our report of the St. Louis shoot, written by Mr. Litzke.

FOREST AND STREAM goes to press on Monday of next week instead of Tuesday, owing to the following day being a holiday; therefore we desire that our contributors favor us this week with their copy at their earliest convenience.

The communication from President Dressel elsewhere in our columns sets at rest some matters pertaining to the Grand American Handicap, concerning the place at which it next will be held.

The Elgin National Gun Club, Elgin, Ill., will hold a target tournament on June 3 and 4, which will be held in its new shooting park, recently completed.

The Du Pont trophy was won at St. Louis by A. B. Daniels, who in the shoot-off scored 20 straight, Riley scoring 19, with one dead out of bounds.

Several reports of club shoots are necessarily left over until next week, owing to the extra space required for the reports of tournaments.

The Brockton, Mass., Gun Club will hold an all-day invitation Memorial shoot on May 30. A. A. Barrett, Sec'y.

The Sherburne Gun Club will hold a tournament on June 22 at Sherburne, N. Y. J. F. Padiford, secretary.

The Hastings, Neb., Gun Club, will give an amateur shoot on July 4, \$150 added.

Mr. C. A. Young won the Republic cup in a most protracted shoot-off.

BERNARD WATERS.

Brockton Gun Club.

BROCKTON, Mass., May 13.—I append scores made to-day. The shooting was brisk; no waiting, and everyone was ready to shoot when his name was called. The medal event bids fair to be a hot one. Our next shoot will be an all-day invitation Memorial Day shoot, May 30. Nos. 10 and 11 were handicaps.

Events:	1	2	3	4	5	6	7	8	10	11
Barrett	9	8	9	9	11	12	8	8	14	4

A. A. BARRETT, Sec'y.

The Savagery of Trap-Shooting.

St. Louis, Mo.—*Editor Forest and Stream:* Now and then a few real good people get after the blood-shedders, invoking humanity and decrying killing. The thirst for blood, they say, is left over from savagery. But somehow the fishers and hunters and shooters increase and multiply, and it is getting hard to find much of a man who does not do one or the other of these things. Why is this? Why does not the race progress? Why are men so perverse? Why is split-bamboo allowed? Where is the miscreant who makes all this powder that is being burned?

Having these questions solemnly in mind, the writer betook himself to the St. Louis tournament one day this week, carrying his old Parker along in case of attack by any of the aforementioned savages. And, truly, they are savages of the deepest dye. Tom Marshall wore a bright yellow hat that would make the Queen of Madagascar offer him half her kingdom for the privilege of wearing it, even if he did not otherwise capture her regal affections by some such savage device as he played on me the first dash out of the box. I was riding from the cars to the grounds in a hack along with him and his hat, together with a lady and gentleman, the former of whom I knew at a glance to be the best wing shot of her sex in the world. Any pigeon that would try to get away from her does not deserve to go to a tournament. But as to the savage device—I took out my slender purse to pay the hackman for my carriage, whereupon this utter stranger with the yellow hat waived me back, exclaiming, "Put that back, please; we are all shooters, and we are all paid for."

I began to suspect right away it must be Tom Marshall. Then, there was a whole tribe there with green hats. I think they were Apaches from Kansas City. A man was there from Iowa, wearing a red hat and a wide smile, called Gilbert. Another one, named Powers, from over around Peoria, had picked up one kid glove somewhere, or possibly he had taken it from the body of some missionary he has captured and boiled he looks as if he had lived off missionaries for some time. He was just as proud of that glove as if he had its mate on the other hand. I looked to see if he had a pair of link cuffs on his ankles, but I guess the missionary hadn't any cuffs on when caught. There was a big Medicine Man, however, from St. Louis, who had all the rest of them guessing. Put the Apollo Belvidere in golf stockings and green velvet knickerbockers and you have him. He had evidently been making medicine in his tent before he came, for he shot almost as well as if he had never killed that British tourist for his clothes. It seemed as if everything one of those creatures had managed to swipe he brought along and wore it, and if it could not be worn, he pasted it on his gun stock. One of them had found an empty flour sack and had cut out the round label and pasted it on his gun. I can't write it in a circle, the way it was printed, but it said, "Gold Dust XXX. Family Flour. The healthiest in the world."

It was a great sight. Mr. Graham, of the Republic, walked around amongst them without his gun and yet without being harmed in the least. Everywhere he went they gathered around him in little bands, shaking his hand with one hand, while feeling his clothes curiously with the other, as if to see if he had the cup in his pocket, but never offering to search him outright. He remarked afterward that he never before saw a body of men engaged in such a nerve-stretching contest where there was such complete absence of worry, vexation or complaint. I have read somewhere that the man who fights laughing is a hard one to whip.

To change the subject, somewhat, and by way of advice to the tyro who goes to a tournament, it may be well to say, in all kindness, that when a pigeon shoot is shot off in squads, and it is not possible to finish it before dark, do not allow the manager of the shoot to over-persuade you into shooting at sundown. He may be anxious to get the shoot along, but you just do like the sophisticated shooters do—put up your gun and leave the grounds when it begins to get too dark to shoot with precision. The writer was in one of those sundown squads, with the sun shining right across the traps, and nearly every one in it fell down, even the peerless Gay, the Eagle-eyed War Chief of Pine Grove. They must have fine spring water in Kentucky, or is it the grass? Anyway, he is about as fast as they come.

GEORGE KENNEDY.

THOS. KELLY.

Passaic City Against Boiling Springs.

Passaic City, N. J., May 20.—There were rather unfavorable weather conditions for the fifth contest of the series between the Passaic City Gun Club and the Boiling Springs Gun Club, held at Passaic City to-day, the wind blowing strongly across the traps from left to right, and the light varying from time to time, cloudy in the early part of the shoot, then clear and bright. Passaic City came out victorious by a score of 152 to 150, a close race. There were ten men on each team, and each man shot at 25 targets, Sergeant system. This concluded the series:

Passaic City Gun Club—Kevitt 16, Hall 19, Platt 12, Palmer 16, Westbrook 15, Reid 20, Spiegel 12, Abbott 13, Jelleme 17, Coman 12-152.

Boiling Springs Gun Club—James 11, Paul 16, Boothark 18, Crosby 17, Lane 16, Pierson 10, Collins 13, Burgess 15, Matzen 12, Huck 22-150.

Programme of New York State Shoot.

THE programme of the forty-first annual convention of the New York State Association for the Protection of Fish and Game, June 5 to 9 inclusive, under the auspices of the Buffalo Audubon Club, is something far above the ordinary. It is open to all amateurs of the United States and Canada. It announces \$1,000 added money, \$1,000 guaranteed in two purses of \$500 each, \$3,000 in merchandise and all average moneys added. Targets, 2 cents.

On June 6, first day, there are nine events, four at 15 targets, four at 20 targets, with a uniform entrance of \$2 in these events, and \$25 added to each. No. 3, is at 25 targets, \$5 added, \$5 guaranteed purse and surplus added. This makes a total of 165 targets and \$21 entrance for the day. Five moneys in 15 and 20 target events; eight moneys in 25-target events. Fifty dollars added for amateur day's averages, ten high guns, \$5 each.

The second day's programme is like the foregoing, excepting event No. 7 is at 20 targets, instead of 15, and event No. 3 is the mammoth merchandise shoot at 25 targets, \$5 entrance, a list of the articles taking up four pages of the programme. There are eight classes of ties, No. 1 class having a Parker hammerless gun for first, No. 2, an L. C. Smith hammerless gun for first, No. 3 a Remington hammerless ejector gun for first, No.

1 a Lefever hammerless, No. 5 an Ithaca hammerless gun, No. 6, a Hollenback, Nos. 7 and 8 respectively, a sewing machine. Tons of coal, bicycles, trunks, cameras, cigars, subscriptions, clothing, railroad tickets, chairs, shoes, furniture, etc., form an interesting list of articles for competition. To each of the twenty-five high guns which fail to win a prize in this event will be given a 1lb. can of Gold Dust powder.

The third day is similar to the first in respect to programme.

The fourth day has three events on the programme. No. 1 is the Gold Dust powder event, at 25 targets, \$2.50 entrance, five moneys, 1lb. can of Gold Dust powder and powder measure.

No. 2 is the Buffalo Audubon Club event, 50 targets, \$5 entrance, handicap, open to all. The prizes are seven, as follows: First, one piano, \$350; second, one building lot, \$300; third, one bike wagon, \$150; fourth, sewing machine, \$65; fifth, undecided; sixth, round trip ticket to Duluth, \$30; seventh, suit of clothes, \$25.

No. 3 is the New York State event (Dean Richmond trophy) at live birds, \$20 entrance per team, birds extra; to first 60 per cent. of purse and trophy; 40 per cent. to second.

To the twenty amateurs making best averages in all events of the first three days of the programme, there are ten merchandise prizes for the ten highest, these being in value, \$40, \$30, \$30, \$20, \$10, \$10, \$12, \$12, \$11.50, \$12.50 and \$10 in cash for each of the next ten averages. Winners select the merchandise prizes in the order in which they finish.

To the ten experts making the best average in the first three days, \$10 will be given to each, and to the high gun will be given a gold watch chain. All residents of New York State, whether competing as experts or amateurs, may compete for the New York city cup, and the Audubon Club will present the winner with a gentleman's solid gold watch, and a lady's gold watch to second. All average prizes will be awarded on the full three days' programme.

Shooting commences at 9 o'clock. Targets thrown from magau-trap. No percentage is taken from any purse; the whole money, less price of targets, goes to the competitors. Targets, 2 cents. Professional experts and manufacturers' agents allowed to shoot for targets only, but will have special prizes provided. Expert amateurs will be handicapped as follows: Every man shooting 90 per cent. or better, will pay \$4 each day. Every man shooting 85 per cent. or better, but less than 90, will pay \$2 per day. These amounts will be set aside for a special purse, to be divided pro rata among amateurs shooting through the first three days of the programme, yet who fail to win one of the twenty special averages.

The New York city trophy is a solid silver cup, valued at \$200, donated by New York members, and is to be emblematic of the target championship of the State of New York. It goes to the shooter making the highest aggregate score in all the events of the first three days; competition open to all residents of New York State, be they professionals or amateurs. The winner holds the cup till the next State shoot, executing a bond in the sum of \$200 as a guarantee of its return.

The foregoing is a general review of the programme. It is worth investigation in its details. For it address C. H. Bamberg, secretary, Buffalo, N. Y.

Headquarters will be at the New Tift House, and the meeting on June 5 will be in German-American Hall, corner Main and High streets.

Pennsylvania State Sportsmen's Association.

The Programme.

Pittsburg, May 20.—*Editor Forest and Stream:* The programme issued by the Reed Hurst Gun Club, covering the Pennsylvania State Sportsmen's Association shoot at Erie, Pa., May 30 to June 2, inclusive, is so totally unsuited for the requirements of such an event, that upon receipt of a copy I at once made a special trip to Erie, Pa., to consult with the officers of the gun club in relation to the same. The result was the revision of the programme and the adoption of the following:

First Day, May 30.

State Events.—Nos. 1, 5, 2 and 4, 15 bluerocks; entrance, \$1.50; \$10 added. No. 3, 25 singles and 5 pair; Milt Lindsey trophy; entrance, \$0 per team; \$10 added. No. 5, 50 bluerocks; Wolsten-croft trophy; entrance, \$3; \$10 added. No. 6, 50 bluerocks; Parker Bros. Gun handicap; entrance, \$3; \$10 added.

Open Events.—Eight events of 20 bluerocks; entrance, \$2.50 per event, and \$10 added to each event.

Second Day, May 31.

State Events.—Nos. 1, 2 and 3, 15 bluerocks; entrance, \$1.50; \$10 added in Nos. 1 and 3; \$5 in No. 2. No. 4, Reading trophy; entrance, per team of five, \$10; with \$10 added. No. 5, Harrisburg trophy; entrance, per team of six, \$10; with \$10 added. No. 6, 50 bluerocks; Remington Gun Handicap; entrance, \$3; \$10 added.

Open Events.—Eight events of 20 bluerocks; entrance, \$2.50 per event; \$10 added to each event.

Third Day, June 1.

State Events—Live Birds.—No. 1, L. C. Smith trophy; teams of three men, at 15 birds per man; entrance, \$25 per team. No. 2, Williamsport trophy; 15 birds; entrance, \$10; birds extra. No. 3, Denny-Wilson cup; 15 birds; entrance, \$10.

Open Events.—No. 1, 10 sparrows; entrance, \$2.50; birds included. No. 2, 15 sparrows; entrance, \$4; birds included. No. 3, 20 sparrows; entrance, \$5; birds included. No. 4, 10 live birds; entrance, \$7; high guns. No. 5, 10 live birds; entrance, \$7; high guns.

Fourth Day, June 2.

Open to All.—No. 1, 20 sparrows; entrance, \$5; high guns. No. 2, 25 sparrows; entrance, \$7; high guns. No. 3, the Streuber special handicap; 25 live birds; entrance, \$25; high guns; handicaps, 25 to 31 yds.; \$200 silver cup and 40 per cent. of purse to winner of purse; cup the personal property of winner.

The revised edition will be mailed to all who have received a copy of the first issue.

From letter received by Secretary Frank W. Bacon and ammunition already forwarded to Erie, there is every reason to believe that the ninth annual tournament will be as successful as any of its predecessors.

WESTERN TRAPS.

Audubon of Chicago.

CHICAGO, Ill., May 20.—Four members of the Audubon Club met for the regular trophy contest on Wednesday of this week at Watson's. There was a stiffish wind and the birds proved strong. Col. C. E. Felton, with a handicap of 29yds. and 2 birds, won the trophy, shooting out in the tie Mr. J. H. Amberg, who has previously won the trophy three times. Score, at 20 live birds:

C E Felton, 29, 2.....*0*2211*02112*20221-14
H O Stone, 30, 1.....21*2*102*2222000022-12
J H Amberg, 29, 1.....001211112*020221*210-14
John Magill, 30, 0.....1100*0*122*10*22221-11

Shoot-off:
C E Felton.....110122212-9 J H Amberg.....121*110-6

Von Lengerke—Dupee.

The race which was to have been shot last Monday between Mr. O. von Lengerke and Mr. Walter Dupee has been postponed and will probably be shot next Monday, May 22. Mr. Von Lengerke was unable to get away from his business at the time originally appointed for the race.

Chicago Trophy.

Messrs. Silas Palmer and A. C. Paterson meet Tuesday afternoon, May 30, in their contest for the Chicago trophy. Both men stand at 3yds., and shoot at 25 birds. Mr. Palmer has won the trophy four times, and Mr. Paterson, challenger, has won it five times.

Marshalltown wins.

Marshalltown Gun Club, of Iowa, defeated Ottumwa Gun Club May 18 in the contest for the championship emblem of the Iowa State Sportsmen's Association, the race being at singles and doubles, and the score, Marshalltown 177, Ottumwa 163.

Montgomery Ward Diamond Badge.

The seventh contest for the Montgomery Ward & Co. diamond badge, held at Watson's yesterday afternoon, brought out twenty-two entries, with one visitor, who shot through the score. These contests continue with unabated interest, and are the success of the local shooting year. The weather was pleasant enough, and the sport was watched with interest by many until nearly dark. Toward evening the birds became more mixed, a sprinkling of slow starters, with occasional fast ones. The tie shooting ran on well into the evening. George Watson officiated as referee and handicapper, his father, John Watson, being absent at St. Louis in a similar capacity. The excellence of the handicapping brought ten men into the tie for first place, Messrs. Shaw, Felton, Searles, Boa, Smith, Sellers, Roll, Krueger, Amberg and Hollister. These shot at strings of 5, handicapped, and so even was the race that it was not until the fifth string that a winner could be announced. George Roll was the lucky man, and came in winner by a nose, since he missed his last bird and would have been retired had not his sole remaining competitor, Mr. Sellers, also missed his last bird, this making 2 straight misses for the latter, something which he had not done before during the whole shoot.

A glance at the scores will show that some long runs were made. Dr. Shaw missed his first bird and then killed 25 straight with the first barrel. To this he added 7 more straight, and then missed his 33d bird. George Roll had something of a similar record. He used up his handicap bird at the first shot, then killed 15 straight, and added 19 more straight in the ties, missing his 35th bird. Meantime the men who had been allowed something in handicap were pounding along in the ties, with Roll and Shaw, who were shot scratch in the ties. Felton, Boa and Hollister did not outlast the first string. Amberg, scratch, was a favorite, but could not finish the third string, which also ended Krueger. In the fourth frame Shaw, Searles, Smith, Sellers and Roll remained. Searles, who had been shooting well, missed 3 straight and sat down decisively. Dr. Shaw missed his third bird in this string, and there being three others still in the race, he concluded that he was out of it and packed his gun, going to the depot to catch a train. Smith now missed 3 straight and fell out. Sellers missed one besides his handicap. It was up to George Roll to kill his last bird and win alone. Roll, however, missed this bird, and having no handicap bird, was thus tied with Sellers on 4. As Dr. Shaw could tie this score by killing 2 more birds, he would have been eligible to shoot had he not left the grounds. Of course he forfeited his rights by leaving the grounds, and though he was by mistake sent for at the depot and returned to the grounds, he was not allowed to shoot. Sellers and Roll then continued, the former missing 3 out of his 6, and Roll winning as above described. Goodrich won the tie on 14 with 9 straight, and Palmer won the tie on 13 with 6 straight. Mr. Platt Adams, of New York, brother of Mr. A. W. Adams, president of the Eureka Gun Club, shot through the event, scoring 13. The following are the scores, at 15 live birds:

J L White, 30, 1.....1110101100111210-11

Garfield Gun Club.

May 20.—In the regular weekly contest of the Garfield Gun Club to-day Messrs. R. Kuss and C. P. Richards tied for the Class A medal, Kuss winning the shoot-off. Dr. J. W. Meek, the able secretary of Garfield Gun Club, proved the best man in Class B, and Mr. Rohler in Class C. There was a very good attendance, as may be seen in the following recountal of the scores:

Kuss11111111110111101111-22

Eureka Gun Club.

A nice little attendance turned out for the regular weekly con-

test of the Eureka Gun Club to-day. The main event was for the Mussey cup, at 15 singles and 5 pairs, the cup being won by Dr. Miller. The following were the scores: Morgan 18, Cunyng- ham 14, A. W. Adams 18, Cornwall 11, F. P. Stannard 15, W. D. Stannard 15, Dr. Miller 19.

In the club shoot, classified, for the target trophy, at 25 targets, W. D. Stannard showed the front in Class A, Dr. B. B. Miller in Class B, Dr. Morton in Class C. In Class D there were two entries, Mrs. C. W. Carson, wife of the honorable secretary, and Mr. Platt Adams, of New York city. Mr. Adams is a good live-bird shot, but in the targets either his inexperience or his gallantry put him in second place, Mrs. Carson beating him by 7 birds in the very creditable score of 18 birds. The following are the scores in the club event.

Class A.....1001100111110111111111-20
A W Adams.....111111011110101111011-20

E. Hough.

480 CANTON BUILDING, Chicago, Ill.

ON LONG ISLAND.

Brooklyn Gun Club.

May 17.—Delightfully fair weather favored the special invitation shoot of the Brooklyn Gun Club, held on its grounds to-day. There was a good attendance of congenial spirits, and the competition began and ended without an unpleasant hitch. John S. Wright was manager, and he had provided some sterling prizes for two events, Nos. 4 and 7, in which the competition was close and protracted, several ties being shot off before definite conclusions were determined. In No. 4 Schortemeier won first, a fine gun case; Remsen won second, some loaded shells; Watson won third, a sterling silver souvenir spoon.

The ties in the merchandise events were shot off in the regular events which followed. Banks shot for targets only. Lunch was served free of charge.

No. 4 event was at 30 targets, \$1.50 entrance, handicap. Mr. Edward Banks acted as handicapper. The scores:

* Five pairs. Nos. 10 and 11 were extra events.

Brooklyn, L. I., May 20.—John Wright wore a smile of rare elasticity when the day of May 20 ended, for his shoot was a decided success, both in respect to its size and to the amiable spirit with which it was pervaded from start to finish. He launched the special prize over which his mind had given some moments of thought for several days, this prize being a Francotte gun. Manager Wright wished to have the conditions so as to encourage amateur interest, for he is a great believer in the sterling worth of that long aspiring individual, so he evolved the following conditions, which are a model of rules in their way:

BROOKLYN GUN CLUB.

Season 1899—1900.

The Brooklyn Gun Club offers a high-grade Francotte shotgun as a special prize, to be competed for under the following conditions:

1. The competition shall consist of twelve contests, one of which shall be held on the third Saturday of every consecutive month, commencing with Saturday, May 20, 1899.
2. Each contest shall be at 50 targets per man, unknown angles; the targets to be thrown from the magatrap.
3. The competition shall be a handicap with an allowance of misses as breaks. The club will appoint a committee, which will revise the handicaps for each contest.
4. The competition shall be decided by a point system, and the points are the number of targets each competitor breaks over 40. For example: A contestant breaks 41, and scores one point; 42, and scores 2 points; and so on up to 50, for which he scores 10 points; but no contestant can score more than 10 points in any one contest.
5. The winner of the prize shall be the contestant making the highest total of points in the competition. The winner of this prize shall be ineligible to win any other special prize offered by the club, unless otherwise specifically excepted.
6. A contestant unable to attend any one monthly contest in this competition will be permitted to shoot up that "back score" in the next monthly contest; and only one "back score" can be so shot up.
7. The entrance for each monthly contest shall be the price of the targets, viz., \$1.
8. Only members of the Brooklyn Gun Club are eligible to compete for this prize.

A few sweeps were shot as a preliminary canter, and then the main event was tackled, Messrs. Remsen, Banks, Kemble, Wright and Waters acting as handicappers. There was a very strong wind blowing from left to right across the traps in the earlier

part of this event, which played havoc with some of the scores. Each shot at 25 targets, then retired till the next round of 25. The scores:

Cincinnati Gun Club.

MAY 16.—Live birds engaged the attention of the members who competed in the shoot of the Cincinnati Gun Club, held to-day.

At the annual meeting of the club, held on May 12, directors were appointed as follows: Messrs. J. B. Mosby, Max Fleischman, G. W. Schuler, A. C. Dick, W. Stevens, H. Robinson, W. Perin, F. Ahlers and G. McG. Morris. From their own list the directors elect the regular officers, which election takes place in the near future.

The match between Messrs. R. M. Burton and H. Burton on the one side, and Messrs. Fleischman and Settles on the other, fixed to take place to-day, was postponed on account of important business engagements of one of the Messrs. Burton.

The keenest interest is manifested in the medal shoot, which takes place on the 27th inst., and an earnest friendly contest from a good entry is anticipated. At the first contest out of the thirteen contestants seven tied with straight scores, namely: Penn, See, Maynard, Ackley, Ahlers, Squier and Kirsch, the latter being the holder at present.

Events 1 and 2 were at 15 live birds, \$5 entrance, birds extra, 60 and 40 per cent. division. The scores follow:

Elgin National Gun Club.

ELGIN, Ill., May 17.—*Editor Forest and Stream:* The Elgin National Gun Club, having just completed their new shooting park, will open it with a grand target tournament on June 3 and 4.

The club is composed of sixty of the most prominent business men and citizens of this city, who are bound together by rules and constitution to protect and uphold the game laws of this State. They are men who never leave a leaf unturned to make it pleasant and satisfactory for all who attend their shoots.

The work of promoting and conducting this tournament is done by members of the club, men of wide experience in trap shooting and are always up with the times. The new park consists of six acres of natural field shooting grounds, so situated that we have a clear sky background for targets and live birds, and the shooting of both can be carried on at the same time without interference.

The club has adopted the Sergeant system for targets, and all shoots will be governed by the American Association rules. We have a large and warm club house, which will give protection to all during stormy and cold weather, and which is equally protected in summer. Surrounding the house, north, west and south, is an orchard of wide-spreading apple trees and an elegant grove of maples and evergreens, making it one of the most desirable shooting and picnic grounds in this vicinity; and now, with all these improvements, the boys are cleaning the rust off their guns and are marching to the firing line in company front, and declaring by Old Glory (which always floats from the club house flagstaff) that they have the finest shooting park in the State, and as soon as they get the guns unlimbered and new stock of smokeless powder they will be ready to go down the line with the rest. The officers are: W. K. Hawthorn, President; C. E. Middleton, Secretary, and Joe Reeh, Treasurer.

ELGIN NATIONAL GUN CLUB.

Emerald Gun Club.

Brooklyn, L. I., May 16.—The monthly club shoot of the Emerald Gun Club took place at Dexter Park to-day. There was a good attendance. Dr. O'Connell, Thos. Short and S. M. Van Allen killed straight. The scores:

The East Side Gun Club, of Newark, N. J., holds its monthly live-bird shoot on Thursday of this week. It has arranged to hold a live-bird shoot on Decoration Day. The main event will probably be 25 live birds, \$10 entrance.

Missouri State Shoot.

ST. LOUIS, May 20.—The twenty-second annual tournament of the Missouri State Fish and Game Protective Association was brought to a close here to-night. While it was impossible to shoot out the programme, owing to bad weather and other contingencies, it has been decided to declare the unfinished events off. In many respects it was a most remarkable tournament, and in point of attendance it was the most successful one held in the West in recent years. The entries ran high throughout the entire shoot, and it was not until near the close that there was any perceptible falling. The St. Louis sportsmen will pride themselves on this gathering for it is seldom the initial effort in this direction is crowned with so much success. This of itself should greatly stimulate shooting interest in St. Louis, and it is to be hoped that this city will once more assume its former position as one of the best trap-shooting cities in the country.

Non-Resident Participants.

THIS is a lengthy list and but helps to demonstrate the magnitude of this tournament. The largest delegation came from Kansas City, and in number nearly exceeds the local contingent. Just what a factor this was in making the tournament a success is borne out by the following list: G. M. Walden, Lil. Scott, Dave Elliott, J. A. R. Elliott, J. M. Curtice, R. K. Campbell, J. B. Porter, E. F. Sweeney, J. E. Riley, R. P. Barse, W. V. Reiger, C. S. Gottlieb, James Sweet, T. M. Hearn, Ed. Hickman, A. H. Glasner, S. S. Millett, Frank J. Smith, Gus. Rickmers, Newton Beach, C. E. Watson, Chicago, Ill.

Of the Trade.

There were Capt. Money and Fred W. Quimby, New York, American E. C. & Schultze Powder Co.; Jno. J. Hollowell, Bridgeport, Conn., and R. O. Heikes, Dayton, O., of U. M. C. Co.; J. W. Mackie, Cincinnati, O., and Jack Parker, Detroit, Mich., of Peters Cartridge and Kings Powder Co.; A. S. Tucker, Meriden, Conn., Parker Gun; Harvey McMurchy, Syracuse, N. Y., L. C. Smith Gun; E. S. Rice, Chicago, Ill., Fred Gilbert, Spirit Lake, Ia., Herbert Taylor, St. Louis, Mo., of the Dupont Powder Co.; Chas. Budd, Des Moines, Ia., shooting Hazard powder and a Parker gun; Col. A. G. Courtney, Syracuse, N. Y., Remington Arms Co.; J. S. Fanning, San Francisco, Cal., Gold Dust Powder Co.; J. A. R. Elliott, Kansas City, Mo., Winchester Arms Co., also shooting Hazard powder; E. D. Fulford, Utica, N. Y., with the Remington Arms and U. M. C. Cos., ever now and then smiling over the success of his new live bird trap; Dan Lefever, Syracuse, N. Y., maker of the well-known hammerless gun; W. R. Crosby, O'Fallon, Ill., with the Baker Gun Co., Batavia, N. Y.

Business Transacted.

The annual meeting of the Association was held at the Lindell Hotel, Tuesday night, at 9 o'clock. In the absence of President P. M. King, Vice-President C. M. Walden called the meeting to order. Secretary Collins reported that inasmuch as the books containing the minutes of the previous meeting had been lost, he would be unable to present the minutes of the last meeting, and was also unable to make a report. At this juncture Dr. Starkloff interposed with the information that notwithstanding the loss of the books he was at least able to report all the clubs that were in good standing, as he had made a personal memorandum of all clubs which had paid their dues at the last annual meeting, including the following: O. K., Forester, Stock Yard, Washington Park, Belt Line, Pastimes, Veterans, Kansas City, St. Louis Trapshooters' League and Joplin clubs.

Secretary Collins also reported that an informal meeting of the officers of the Association had been held in St. Louis Feb. 15, at which time the following directors were appointed: John Cabanne, J. A. Corray, C. McL. Clark, A. E. Winklemeyer and Herbert Taylor, St. Louis; G. M. Walden, C. J. Schmelzer, Geo. Stockwell, J. B. Porter, J. W. McCurdy, J. Lee Porter, Dave Elliott, C. P. Baldwin and Dr. E. Von Quast, Kansas City.

Collection of dues was now in order, to which the following responded: Forester, O. K., Stock Yard, Washington Park, Belt Line, Veteran and Kansas City's, of Kansas City; Marions, Palmyra, Dupont Park, West Ends and St. Louis, of St. Louis. On behalf of the two other clubs from St. Louis who had participated in the team race this year, the officers of the Association stated that their dues would be forthcoming within the next few days, and gave their personal guarantee to that effect. The Pastime Gun Club, of Kansas City, failed to respond, but at the suggestion of Mr. Walden this club was granted a few more days' grace, as he thought it would most likely continue a member of the Association. The St. Louis Trapshooters' League was reported out of existence, while the Independence (Mo.) club failed to respond. When the name of the Joplin club was called, Mr. Sergeant, the only one present from that city, professed ignorance as to this club, and stated that he was unaware that this club had ever affiliated with the Association. The secretary reported that it had paid its dues for the ensuing year. Now followed the selection of a place for holding the next annual meeting and tournament. Dr. Starkloff, on behalf of St. Louis, pleaded that they be permitted to retain the same here, and thereby be given the opportunity to show that they were capable to conduct the tournament so that it would be a credit to the Association, and further that their next effort would far exceed the present one. He also begged the visitors to overlook any little shortcoming at this shoot, which, he said, was entirely due to lack of experience and workers, as all the labor had devolved almost entirely upon the shoulders of two members of the local contingent, Mr. H. B. Collins and Mr. Herbert Taylor, and to whom all the glory and success of the present shoot was due. The shooting interest had received a great stimulus in the city by holding the tournament here, and he felt certain that the number of co-laborers in the interest of the Association would be materially increased next year, which would insure additional success. On the subject of pigeons he begged to say that next year there would be no scarcity of birds, as the management would profit by their previous experience in this matter. He also desired to thank Messrs. Elliott Bros., Kansas City, on behalf of the St. Louis Shooting Association, for their kindness in furnishing pigeons in excess of their contract and thus enabling them to shoot the trophy events, as all other parties had failed to supply the birds they had agreed to.

Mr. Sweeney, on behalf of the Kansas City sportsmen, moved that the next tournament be held in St. Louis, which was carried unanimously.

The election of officers next took place and resulted in the selection of Dr. Max C. Starkloff for President; C. M. Walden, Vice-President; H. B. Collins, Secretary, and Herbert Taylor, Treasurer. All of these were chosen without opposition, though the name of Mr. Charles McL. Clark was placed in nomination for treasurer, but the latter declined, as he stated that he would most likely be away from the city next year. The Missouri State Amateur Association was next touched upon, and a motion was car-

ried that the members of that organization be extended an invitation to affiliate with this Association. Mr. Taylor, in behalf of this organization, requested, in order to give it some recognition, the name of the Missouri State Fish and Game Protective Association be changed to that of Missouri State Sportsmen's Association. Mr. James Whitfield seconded the motion for the reason that it would reduce the manual labor of the newspaper men, and further stated that it was very trying to write all of the above when one was in a hurry. This met with so much opposition from the older members of the Association that the motion was withdrawn, Messrs. Hickman, Riley, Bates, Field and Lemon all speaking in opposition to this. It was decided to extend the invitation to the Missouri Amateur Association, but that no further concession would be granted. Mr. Taylor, on behalf of this organization, expressed the belief that all its members would readily affiliate, so that it looks very much as if this organization will cease to exist. It was carried that the Association buy the book entitled "Twenty Years of Trapshooting in Missouri," inasmuch as this contained all the records of the organization, and also that a new set of books be purchased. On motion of Mr. Taylor letters of thanks were to be sent to all parties who had contributed trophies to be contested for at this tournament, the committee to take charge of this being Dr. Starkloff, H. B. Collins and Herbert Taylor.

The presentation of medals now took place, and Mr. Walden, on behalf of the Association prefaced the presentation of all of these with a few appropriate remarks.

Mr. Walden now called the attention of those present to the fact that there were a great many clubs in the State of Missouri which had as yet not affiliated with the Association, and in behalf of the latter begged the assistance and co-operation of all the members to put forth their best effort to induce these to join this organization, and he hoped that next year there would be thirty teams entered in place of thirteen, as had been the case on this occasion. Adjournment next followed.

First Day, Monday, May 15.

There were two events to be disposed of to-day, the State team championship of four men and the combination State and interstate championship. Only the former, though, was brought to an issue, it resulting in a victory for the Veteran Gun Club, of Kansas City, who came out of the fray with the superb score of 58 out of 60, duplicating to an iota the score of the St. Louis Club, who were the victors last year. The two losses were birds dead out of bounds, as was also the case with the former winners.

The Veteran Club was composed of some very excellent material, J. A. R. Elliott, Jim Riley and Geo. Stockwell being in reality seasoned veterans at the trap. James Sweet, the other one of this quartette is the only exception, as he is comparatively a colt, having broken into the fold about three years ago. He, however, has shown up to advantage in sweeps, though he has never been tried out in a team race of this kind, where a man's nerve is put to its actual test, and was therefore to some extent an unknown quantity. However, be this as it may, all apprehension if any existed in the minds of those who had the welfare of the team at heart was readily dispelled by the way this youngster performed at the trap. He was cool and collected at all stages of the race, and his time and precision were perfect, so that, with all these qualities, he naturally gave a good account of himself. He finished with a clean score, and thus shared with Jim Elliott the honor of being high man on the team. Where he was put to the actual test was in the finish, he being the last man on his team; so that when he was called to the score to shoot his final five birds he was confronted with the knowledge that only a straight would land his team a winner, thus it devolved entirely upon him to gain the place of honor. Jim Elliott was the other straight man of the team, which is nothing surprising, as he has frequently accomplished this feat. Jim has only recently returned from Hot Springs, and appears trained to the minute. He shot along in his usual dashing style, which means much when he is at his best, which seems to be the case just now. Jim Riley and Geo. Stockwell each finished with 14, their losses being designated by an asterisk, which was the only thing to mar their otherwise perfect shooting. While their totals are incomplete the score goes to demonstrate that their aim must have been true, but that Dame Fortune had lent her smiles elsewhere. Both these veterans have been making history in the shooting world for near on to a score of years, their names having often been associated with the triumphs of the Kansas City shooters.

Second honors went to the little town of Palmyra, which but for its shooting contingent would be known to few people.

J. R. Wilmot, who has a reputation of long standing as one of the nerviest shooters that ever faced a trap, acted as pace-maker for this bunch, and did what he has frequently done—gone down the line without making a skip. The other three—Bates, Nipper and Stockton—all rendered a good account of themselves, scoring 14, and the fact that they failed to imitate Wilmot's example was entirely due to hard luck, for their losses were due to dead birds out of bounds. The grand total of this team is 57.

For third honors we again find two Kansas City teams contending, as both the O. K. and the Washington Park clubs finished with 56. These teams are composed of shooters of the younger generation, and much friendly rivalry exists between them. However, in this instance neither has any glory over the other, as their scores are identically the same. On the O. K. team those two experienced pigeon shooters, Gottlieb and Hoffman, finished straight, while Dave Elliott and W. S. Allen did the same for the Washington Park team. Again for the former Cockrill scored 14, Beach doing likewise for the latter. Finally Bramhall and Wright, the two remaining ones, had a total of 12.

As this is a class event, the Stock Yard team, of Kansas City, are fourth with 54. On this team Campbell and Barse went straight, Mills got 13 and Walden 11.

Owing to the medal being all that the winning team gets, there are five places to contend for. Thus the Du Pont, of St. Louis, and the Forester, of Kansas City, get fourth money on 53. The high men on the former are J. H. Conrades, Jr., and Spencer with 14. J. A. Smith with a like total leads the Foresters. The disappointment of the shoot is the showing of the West End team, of St. Louis, who won the medal last year by the same score as that which landed the Veterans a winner on this occasion. This team is made up of three of the original winners, only one change having been made, that being the substitution of Sumpter for Kling, the latter being at present in Germany. However, this change should but have added strength to the team, and doubtless would but for the fact, unfortunately, that both Dr. Starkloff and Sumpter were on the sick list and shot under protest. That they were physically incapacitated is evidenced by the score, for both had prior to this been showing good form; the former shooting over 90 per cent. The latter had not lost as many birds in the last 100 as he did in this 15. Dr. Smith was the only one of the team who gave a good account of himself, he scoring 14.

Collectively, the shooting was much better than that of last year; for, while it took the same total to win, it also required better scores to get in the money. Last year the Washington Park and the Pastimes won second money on 53, a margin of 5 birds for the winners. In addition, the shooting, too, was of a higher quality, as the birds were far superior to those of a year ago, which, however, is mainly due to the traps employed here, which make sitters a rare exception even at this season of the year. But for these traps the competition would have surely proved a tedious, tiresome slaughter of the innocents, as the weather was decidedly against the birds, being excessively sultry, though a good wind helped matters out materially.

The conditions of the event are four men to a team, 15 birds per man, entrance \$20, per team. A hundred dollars goes to the team last holding the medal, and an additional 100 guaranteed to be divided 40, 30, 20 and 10 per cent. All teams must be members of bona fide gun clubs and said club must be a member of the State Association.

The individual State and interstate championships closed with 58 entries, and the following were straight as far as they had shot. Budd, Gilbert, Kimball, Fanning, Allen and Porter 20; Griesdieck, Chase and Mason 15, and Sumpter 10.

Second Day, Tuesday, May 16, Targets.

With the vast host of entries in the target events it was next to impossible to finish the programme, which called for 215 shots. Nevertheless Manager Hallowell made a great effort at it, but only partially succeeded, as but twenty shot through before darkness put an end to the sport. However, the events were closed and those who did not get to shoot had their entrance refunded. Jim Elliott's name was first on the list, and after the day's averages had been computed he is still in that position, for his percentage of .944 tops them all, though his margin is but one over Parmelee, who is second with .939. Gilbert and Crosby are tied for third position. Taylor leads all those who missed but one event, and had he shot this and maintained his average he would be contesting with Parmelee for second honors.

(One remarkable feature of the day is that notwithstanding there were 100 entries in No. 2, a 15 target event, no one could make a straight. Nos. 9, 10 and 11 are the E. C. cup events, though on the programme they were Nos. 3, 5 and 9. These are grouped together so as to enable the readers to perceive at a glance what form the contestants showed therein. Only three times did straight scores appear on the score sheet in these events, Gay, Parmelee and Sergeant being the performers. These events are divided Rose system, six-money ratio, 7, 5, 4, 3, 2 and 1. Gay received the munificent remuneration of \$3.85 for the only straight in the second of these events. This shows what a misapplication of the system will do.

Altogether 116 participated in the target events, but the names of those who shot at less than 50 targets or who failed to make 60 per cent. are not shown in the table. Among these were Kess, Heilmann, J. Hoff, W. Hoff, Lemon, R. A. Jones, Post, Clyde, Renick, Bruns, Wright, De Shong, Dickinson, J. Cabanne, Starkloff, Simms, Woodcock, Selzer, Leathers, Jackish, Nipper, Mason, Dickson, Stenber, Been, Berkey, Mrs. Corry, J. S. Smith, Morrison, Greisdieck, H. J. Cummings, C. Cummings, Burr, West, Carpenter, Skinner and Richie.

The weather was hot and sultry, and a cross-wind made the targets very erratic.

Gay and Taylor are high men in the E. C. cup events with 72 out of 75.

Minneapolis Gun Club.

MINNEAPOLIS, Minn., May 18.—The Minneapolis Gun Club had a very pleasant afternoon's sport at the traps yesterday. The attendance was fair, considering that several of its members are absent from the city attending the different tournaments. The scores averaged good and some remarkable shooting was done. Six new members were elected and a team selected to attend the tournament of the Wadena Sportsmen's Association, to be held at Wadena, June 7 and 8. The following are the scores of the day:

Schlitz Diamond Badge.

The Schlitz diamond badge was contested at 25 targets; unknown angles:

Interstate Shoot at Oil City.

THE first of the interstate shoots for 1899, held at Smithman's Park, Oil City, Pa., on May 17 and 18, was unfortunate in respect to weather, and consequently in respect to its best success, for the weather was about as bad as ever existed at a trap shoot.

The trade was represented by B. H. Norton, of the Hazard Powder Co.; W. L. Colville (Swiveller), of the Du Pont Powder Co. and Chas. Grubb, of the Kings Powder Co. and Peters Cart-ridge Co.

The visitors were H. P. Shaner and J. Atkinson, New Castle, Pa.; F. H. Snow, Brooklyn, O.; L. B. Fleming, Pittsburg, Pa.; J. Johnson, Dr. Lashells, H. Kridler and Col. Reisinger, Meadville, Pa.; H. R. Nye, Sharon, Pa.; C. A. Smith and A. P. Pope, Corry, Pa., and W. H. McCray, Emporium, Pa.

There was a heavy downpour of rain, and those who took part in the tournament were drenched to the skin by it. More than a dozen times during the day it was necessary to bail out the small house sheltering the trap power, although it is equipped with a drain. There was a part of the day where the lightning was so vivid and constant, and the thunder so terrifying that it shook the nerves of the shooters, and had considerable to do with the small scores made. Mr. E. E. Shaner, who is managing the shoot, declared that there are no grounds in the country where the background is so poor as at Oil City.

Ten events were scheduled for the first day. Nine of these were finished. The feature of the first day was the continuous score made by F. H. Snow, of Brooklyn, O., who scored 77 birds before making a miss. This breaks the previous record of these grounds, which was 50 until yesterday. Several of Meadville's shooters arrived on Wednesday evening, among them Mr. Johnston and Dr. Lashells. The score:

Wednesday, May 17, First Day.

Events:	1 2 3 4 5 6 7 8 9 10

Thursday, May 18, Second Day.

The visiting shotgun experts are especially enthusiastic in their comments upon the reception that has been given them by the members of the local association and the people of Oil City. Their welcome was most hospitable, and the visitors are properly appreciative.

Elmer E. Shaner, who managed the two days' tournament, states that the assistance given by the Gun Club to make the affair a success was perfect. He states that the men supplied by the club for keeping scores and officering the event were all that could be desired, and that at this shoot, as in the State shoot, held two years ago, this was remarked by all visitors. He attributes the perfect arrangements to the fact that all, or nearly all of the members of the local club are "office men," with a great deal of executive ability, and who are in the habit of making arrangements for carrying on any enterprise far ahead and providing for any unforeseen emergency that might arise.

Mr. Shaner, who has much experience with shotgun men, as well as a manager of shooting tournaments, declares that he and all visitors had been treated royally, and that the hotel accommodations were all that any person on earth could ask. The scores:

Fitchburg Rifle and Gun Club.

FITCHBURG, Mass., May 18.—The traps furnished sport for fourteen shooters at the grounds of the Fitchburg Rifle and Gun Club, May 17. The day was fine, with a good breeze from the west to help the right angles along, and make the lefts rise or fall as the wind happened to catch them. This no doubt is responsible for many of the poor scores, and adds much more credit to the good ones which were made. All considered, it was a perfect day for practice, which no doubt will show its good effects at some future time, when conditions are more favorable for high scores.

The feature of the shoot was a team race between team 1 and team 2, which consisted of four men each. Thirty birds were shot at, consisting of 10 known, 10 unknown and 10 reverse. Owing to the failure of some of the most reliable men in team No. 2 to get good scores, it resulted in their defeat by 5 birds, but as team No. 1 failed likewise it saved a walkover, and made low totals for both. There was so much interest shown and so much sport derived from the team race that it will be a regular thing hereafter.

Among the many spectators present were noticed a number of ladies, who are always welcome. Let more come and enjoy the sport, and we will try to make them feel at home. The scores in full:

Events:	1 2 3 4 5 6 7 8 9 10 11

Centerdale Gun Club.

CENTERDALE, R. I., May 13.—The medal handicap shoot and other events of an interesting character took place at the Centerdale Gun Club yesterday afternoon. There was a good congregation of trap shots, and novelties were introduced in the way of shooting at known, unknown, expert and reverse angles. Of course the shooting heretofore has been at either known or unknown angles, but this was systematized in the shooting yesterday, and the shooting at reverse and expert angles was an innovation which pleased the cracks and caused some of the less expert to fall down before the difficulties of these methods of springing the birds. About 1,200 birds were thrown and the shooting was on the whole very good, that of Smith and A. Arnold being noticeably excellent. No. 7 was the medal handicap; Nos. 9 and 10 were miss-and-outs. The scores by events were as follows:

Events:	1 2 3 4 5 6 7 8 9 10 11
Targets:	10 10 10 10 10 10 25 25

Boston Gun Club.

WELLINGTON, Mass., May 17.—Two squads and a few over used the afternoon of May 17 to good advantage, and before 5 o'clock the sixth shoot of Boston Gun Club prize series had seen its finish. Certainly the finest of weather is so far attending this series—in pleasant contrast to the rain and sleet of winter shoots. Today was bright, clear and altogether delightful, except for a cool wind that prevented sitting out of doors. This was a slight disappointment to some of the company, who well know that one of the delights of Wellington during warm weather is the occupancy of chairs tilted back on platform at an angle of 45 degrees, with either fragrant Havana or more plebeian pipe doing double duty, while the squad smashing targets is the cynosure of all eyes, and oftentimes targets themselves for the good-natured banter of the wall flowers.

A Hingham club member scored high in match to-day, followed closely by two B. G. C. representatives. Scores complete as follows:

Events:	1 2 3 4 5 6 7 8 9 10 11 12 13
Targets:	10 10 5p 10 10 10 10 10 5p 10 15 15
Gordon	8 8 6 6 9 8 8 6 7 6 7 11 13

St. Paul Rod and Gun Club.

ST. PAUL, Minn., May 13.—I add score of our badge shoot to-day. A strong wind made the shooting very hard, although Morrison made a splendid score of 23, and won the senior badge. Perry scored 18 in the junior class and won junior badge. Other good scores were: Morrison and Thompson each 12 out of 5 singles and 5 pairs. Perry and Wood II each. Two thousand and fifty targets were thrown. Sergeant system, unknown angles:

Dauz	110000111110001001100111-14

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY, }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, JUNE 3, 1899.

VOL. LII.—No. 22.
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

NOTE AND COMMENT.

THE picture which forms our illustrated supplement this week is of an old-time scene in the Indian country. It complements the illustration in our issue of April 1 of the Indian women cutting up the meat after the hunt. The picture to-day tells its own story. It is the return to camp with the meat. It is a leaf out of the past; but there are still many who can summon for themselves just such scenes from their memory of old days in the West, and they will testify to Mr. Deming's happy reproduction of a typical incident of plains life.

In those days the hunt was arduous. The people who killed buffalo before the white man came did so exclusively for subsistence. It was hard work, and while they knew something of the excitement and stimulus the modern sportsman finds in the pleasure of the chase, the purpose then was purely utilitarian, to provide the family supplies. And as here shown, the women of the household had their part in the work as well as the men. To them fell the task of butchering and packing in; what our more modern civilization leaves for the men was in those days performed by the wives and mothers and sisters.

If we may believe the old accounts of buffalo hunting in the period before the advent of the horse, it was not only arduous, but hazardous. We have a picture of it in Pere Marquette's journal of his expedition to discover the Mississippi River. Like all the Jesuit missionaries who explored the continent in advance of other white men, Marquette gives familiar insight into savage life and ways, and takes pains to record not only his observations of the people, but of the fish and game as well. On his way down the Mississippi River he saw vast herds of pisikious or wild cattle "more corpulent" than the cattle of France, having great humps, and manes which falling over their faces gave them a hideous appearance and obscured their vision. They were scattered over the prairie like herds of cattle. Marquette counted one band of 400. "They are very fierce," he writes, "and not a year passes without their killing some Indian. When attacked they take a man with their horns if they can, lift him up and then dash him to the ground, trample on him and kill him. When you fire at them from a distance with gun or bow, you must throw yourself on the ground as soon as you fire and hide in the grass, for if they perceive the one who fired they rush on him and attack him."

This was in 1673, before the firearms brought into the country by the fur traders had become common, and when the usual weapon of the chase was still the bow. Under these conditions we may well understand how the buffalo was a formidable creature, and how the savage who hunted afoot verily took his life in his hands. When horses were acquired by the tribes, and feeble man became a centaur, the situation was changed. From this new apparition the buffalo fled in terror. When the white man appeared on the scene the fear of human kind grew with experience. From the undaunted creatures which, when attacked, "if they perceive the one who fired rush on him and attack him," the game stampeded at the sight of their pursuers; and the most vivid and most lasting picture of the American buffalo, as we recall it to-day, is of herds in retreat, a whole species "on the run," enveloped in the dust of the retreat, and vanishing into oblivion.

We could make no announcement which would give more genuine satisfaction than the promise of a new series of chapters from the pen of Rowland E. Robinson, descriptive of nature and human nature in Vermont. In this story Mr. Robinson goes back to "Pioneer Days," when Josiah Hill was, but Danvis was not. As a writer

who is ever felicitous, whether his theme be of the woods and the wild creatures that dwell in them, or of men and women with their mingled virtues and frailties, Mr. Robinson has won for himself an unique and secure place among the authors of his time; and in this new story will be found the qualities which have made the other Danvis series so popular. The first chapter is printed to-day; the second will follow next week.

A whole volume might be written on the relations, happy and unhappy, which exist between the visiting sportsman and those he visits, whether his host be an old friend, a chance acquaintance, or just a camp keeper or hotel man pure and simple. The letters which are published in our shooting and angling columns have in them from time to time many pretty illustrations of the added satisfaction one finds if his associations at his house of entertainment be of a pleasant nature. A fishing or shooting trip is all the more memorable, if it means the forming of new friendships or the strengthening of those already established. The pursuits of the field have in them, too, a broadening influence, the effect of which is more extensive than the limits of individual application. The sportsman as a traveler who gets out of the rut of home surroundings, and goes abroad into the world to study its people and their ways, must be liberalized by the experience. Thus travel in pursuit of sport is a foe to sectionalism. The man from the East who goes West for his shooting, the man of the West who comes East for his fishing, the Northerner who visits the Carolinas for quail, and the Southerner who seeks trout in Michigan, each and all return home with a better knowledge of the people they meet; and from the better understanding of one another comes, as of course, the closer sympathy. Your much-traveled sportsman, tourist is tolerant and cosmopolitan; no civil war growing out of sectionalism could ever disturb the serenity of a people devoted to the recreations of the field.

Dr. Tarlton H. Bean, who is in charge of the Forestry, Hunting and Fishing, Group 9, of the American exhibit at the Paris Exposition, tells us that there is every promise of an excellent representation by the United States in these special fields, particularly as to forests. America is so far in advance of Europe in the making of fine fishing tackle that a display of this industry in the United States, if fairly representative, would be certain to surpass that made by any other country; and we trust that Dr. Bean may be successful in securing the co-operation of our tackle makers and in gathering for Paris a creditable exhibit.

The Paris Exposition will open April 15 and close Nov. 5, 1900. The grounds are located in the center of Paris, on the banks of the River Seine, and include an area of 336 acres, or less than one-half of the extent of grounds occupied by the Columbian Exposition in Chicago, in 1893. The forestry exhibit of the United States will be located in the Palace of Forestry, Fishery and the Chase, near the junction of the Avenue de Suffren with the Seine, and in the annex to that building.

The amount of space available for forestry is small, and for that reason the exhibit must be chiefly collective; but individual space will be allotted to manufacturers, corporations or associations, local or State, so far as circumstances will permit. Every exhibitor in a collective exhibit will receive the same consideration from the jury of awards as if he were exhibiting in space allotted to him as an individual and covering a large area. Information may be obtained from the offices of the Commission, in the Auditorium Building, Chicago, or the Equitable Building, New York, by persons who desire to become exhibitors. This explains the relations of the exhibitors to the United States Commission and to the French authorities.

Those who remember Mr. Hofer's account of his capture of beaver in the Yellowstone Park for transferring to the National Zoological Park in Washington, will be interested to know that the beaver have established themselves in their new home. We give an illustration taken from the current report of the Secretary of the Smithsonian Institution showing a beaver dam in the Park. Owing to the sequestered situation of the beaver colony, few who visit the Park have an opportunity of seeing the animals or their secluded retreat. It is certainly an

extremely interesting phase of wild life here exhibited, that close to a large city these retiring creatures should have settled down to build homes as in their original wilderness surroundings in the Rockies. Some of the beaver which escaped from the Park, we believe, were afterward discovered in a home which they had established for themselves on one of the neighboring streams near Washington.

Superintendent Baker's report shows that the National Zoo is in a promising condition. The collection of living animals used for purposes of exhibition during the year comprised 549 specimens, embracing 124 species, the value of the animals belonging to the Government being estimated at \$25,000. The magnificent possession which we have in this Zoological Park is not appreciated as it should be by the public. Those who are interested in our native American wild life should not fail when visiting Washington to make excursions to the Park. It is readily accessible by trolley lines, and in the magnitude of the area, the natural beauty of its contours, the number and variety of the specimens, and the admirable provision made for showing them, one will find entertainment for an hour, a day or a week.

Dr. Jos. Kalbfus, Secretary of the Pennsylvania Game Commission sends us the text of the new game warden law, which we publish in full, both for the benefit of Pennsylvania readers and of others who may see in this system something worthy of adoption elsewhere. There is no good reason why in every case the laws intended to protect the fish and the game should be set apart from other laws by taking their enforcement out of the hands of the regularly constituted executive agents. The plan adopted by Pennsylvania of making constables ex-officio game wardens, and not only this, but prescribing punishment for them if they do not perform their duty, is one which we shall watch with much interest, because it seems to us to offer a solution of what is often a perplexing problem.

What an extraordinary picture that is which is drawn by our correspondent, J. B. D., writing from Bingham, Mich., where he is encamped on the shore of Carp Lake, famous as an old-time resort of the Kingfishers. Carp Lake is the chosen nesting ground for wildfowl. Under ordinary conditions of savagery, let us say, the birds would find there an unmolested refuge for their nests and young. The same harbor would be accorded to them under any decent civilized system of shooting and regard for the game; but under the Michigan regime, which has just been put into operation by the enactment of a law permitting spring shooting, Carp Lake is now invaded early and late in the day by shooters who harry the fowl on their nesting ground and kill the ducks, which should be left to lay their eggs and rear their young. We cannot imagine any reasonable defense for this spring shooting under the conditions here described. It is wrong in its very essence, for it is a crime against nature. Our correspondent very pertinently puts the inquiry whether the spring shooter is the only one in the State whose interests are to be considered.

Mr. J. S. Hunter, writing from Nebraska, records that he has just obtained a natural history specimen rare in that country, being nothing less than a young python about three feet in length. The snake came in a bunch of bananas from some Central American port. Such accidental importations of exotic species are not infrequently chronicled; some of them are referred to in the paper given in another column by Mr. T. S. Palmer, of the Biological Survey. Mr. Palmer has collected and summarized information covering a very wide field, of the introduction and acclimatization of exotic species in various lands; and his paper is not only an interesting contribution to natural history, but a presentation of facts and principles which have economic value for the warning and instruction contained in them.

Owing to the observance of Decoration Day this issue goes to press a day earlier than usual; and much news matter which otherwise would have appeared has of necessity been put over.

The Sportsman Tourist.

Pioneer Days.

I.—At the Deer's Head.

ONE evening more than a century and a quarter ago there was a motley company gathered in the bar-room of the "Deer's Head Tavern," the house of entertainment for man and beast in one of the border towns of Connecticut. There were farmers of the neighborhood, the blacksmith, the shoemaker and the hatter, already proverbially drunk; and there were young men, who dropped in to gather news of the wild new lands to the northward from returning explorers and speculators.

Among these was an old hunter, a ranger of the old war, on his way to the rich trapping grounds that he had discovered and made note of, during his military service. He was a wiry little man, baked in the sun; past middle age, smoked by a thousand camp-fires, salted by the snows of many winters, until his hair and stubbly beard were as grizzled as a frosted hemlock, and his skin the color and toughness of jerked venison. His well-ripened nose went frequently into a mug of flip, which he was drinking at the expense of his most interested listener, a tall, muscular young man, with keen gray eyes, a prominent pointed nose, and a firm set mouth, all constantly turned upon the hunter to catch every word that dropped from his lips.

There was another listener, who was giving very close, though not so noticeable attention, while as yet taking no part in the conversation, but who silently sipped his rum and water as he cast furtive sidelong glances of his sharp, black eyes upon the old ranger and his young friend. He was clad from head to foot in a worn suit of rusty black which, with a sanctimonious cast of countenance, gave him the appearance of a clergyman.

"Yes, sir," the hunter said, withdrawing his nose from the mug after an exhaustive draught, and looking suggestively into the empty vessel, "if I was a young man, which I hain't, an' wanted to farm it for a livin', which I don't, bein' tew old a dog tu l'arn new tricks, I'd jest go up there int' the wilderness, 'way up, ye understan', where there hain't nob'dy, an' I'd make me a pitch nigh tu good trappin', an' I'd resk but what I'd git enough fur, in tew year, fall an' winter, tu pay for my land."

"Du you know any sech a place?" the young man asked. "Lord bless ye, dozens on 'em, on the Great Otter, an' the Little Otter, an' on the Lewis Creek, acres an' acres, flat as this 'ere floor, an' where you hafter hunt half a day tu find tew stuns tu crack a but'nut."

"It's a terrible ways off, hain't it?" the young man asked, his eyes wistfully following the trim figure of the landlord's daughter, who now entered the room and traversed the length of it in quest of her father, who was busy at the fireplace, heating the loggerhead for the concoction of two fresh mugs of flip. Her hair was red-gold, her cheeks red roses, and her eyes of violet blue, wherewith she cast a bewitching glance on the young man, as she passed, and bestowed a nod of her pretty head.

"Lord, she's a pooty one!" the hunter remarked in unfeigned admiration. "Naow, if you could get her tu jine ye, boy, in makin' a pitch up there, you'd be fixed complete."

He drained the stale remaining drops from his mug, and his companion, noting his unslaked thirst, ordered a replenishing of the mugs with a further purpose of covering his blushing confusion. "Why, yes," the ranger resumed, waiting thirstily with watery mouth, "the maouths of them streams is a good ways off, but the Great Otter head's nigher, not far from the West River, which, an' it, was a main part o' the ol' Injun Road. Look a' here," he drew from his pocket a flat powder horn engraved in black outlines with a rude map of Champlain and its tributaries, "it is daown in the flat country nigh the lake, but where you want to go is near the maouth of the Little Otter, or the Lewis, where the's better farm land and trappin' ground."

The clerical looking stranger pricked his ears at these names, and clearing his throat to call attention, said blandly, addressing the younger man: "My young friend, if you have an idea of going into the new country, as your friend so wisely advises, I think I can help you to the very place you want." Thereupon he drew a map from his pocket and spread it upon the table. It was a plotted map of a township in the New Hampshire Grants, showing every numbered lot and the course of the streams.

"There," said the stranger, laying his finger on a lot between the mouths of two small rivers where they entered the lake, "there's a lot 'at I've took on a debt an' can sell dog cheap for cash, an' it's exactly what you want for the purpose your friend here is a-speakin' of. Just look at it, a-layin' on two rivers, with a mill seat an' both of 'em, in it, an' trappin' an' fishin' right tu your door."

"It does look temptin'," said the old ranger, studying it attentively; "but I can't seem tu remember no falls so low down on the Little Otter or the Lewis, ary one. Was you ever there, stranger?"

The landlord now came with the foaming mugs diffusing a pungent fragrance of beer and spirit as he set them before his guests, and gave them a finishing touch of creaminess with a sizzling plunge of the jointed loggerhead.

"Buyin' of ye a right o' land up in the Hampshire Grants, Josier?" he asked, glancing down at the map.

"Wal, a-thinkin' on't some," the young man replied.

"A good idee, for a young feller," said the landlord encouragingly. "Jest what I'd du if I was your age, bein' the's no gre't chance here, in the old settlements. Mr. Capron, here 's jest come from up that way—he can tell ye all about it. Mr. Capron, this 'ere 's my young neighbor, Josier Hill, an' this is Kinelm Dalrymple, one o' Major Rogers' Rangers in the ol' war."

"Hope I see you, gentlemen, an' here's to our better acquaintance," he touched the glass to his lips and the others responded in the same manner.

"I've scaouted the country all over by land an' water an' I disremember falls on any stream wi'in three mild o' the lake. Hev you been there, Mr. Capron?"

"Candidly, I hain't, but a friend o' mine has, and I depend as much on his account as if I'd seen it."

"Wal, it don't make no diff'rence about the mill seats. Josier don't want none."

Capron resumed: "In a-trav'lin' through this vale o' tears if one can give a helpin' hand tu a feller mortal he helps hisself, sort o' boosts both, so to speak—which is what I want to do for our young friend and myself."

"Be you a minister, Mr. Capron?" Josiah asked, looking at him with the suspicion of an ungodly person.

"I am not, but I hope, a humble follower in the footsteps of the Master," said Mr. Capron, dropping his eyelids and looking meek.

"Hear the damned wolf in black sheep's clothing!" said a florid, fair-haired giant who was drinking all that was good for him at a neighboring table, with the drunken hatter and a handsome dark-haired young man for his companions. "If the Master caught him a-follerin' him, he'd kick him so high, he could hear the Apostles sneeze."

"That big feller over there," the landlord whispered, pointing to the trio, "is a takin' up lots o' land in the Grants, him an' his brothers. That han'some little chap 's one on 'em—Stub Allen, they call him. T'other one is ol' Ethan, a reg'lar ol' war-hoss, 'at fears neither God, man or devil."

"All 'raound my hat I wears the green willer," the hatter howled in a high falsetto, that cracked and fell in a ruin of rumbling bass.

"H-s-s-sh!" the handsome brother cautioned with a sideways toss of his curly pate toward the landlord.

"S my hat! I made it, 'n' I'll wear willer on er hat 'f I min' ter, 'n' I'll sing 'bout 'em 'f I min' ter!" the hatter hiccupped, glaring savagely into space.

"That damned fool of a hatter is drunk ag'in," the landlord remarked, sorrowfully. "I'll hafter send him hum tu rights. Say, Bellows," to the brawny blacksmith, "can't you coax Felt home? He's full enough."

"Oh, yes, I can coax him," the smith said, rising and going across to the little hatter. "Come, Felt, it's time you an' me was tu hum. Come!"

"Mr. Felt-hat is my guest, and he'll go home when he and I please," the flaxen-haired giant roared.

"But his wife's a-waitin' for him, Mr. Allen," the blacksmith urged, mildly, but with a dangerous glitter in his cavernous black eyes.

"Captain Allen, if you please," the giant amended his title.

"Beg pardon, Capt'in Allen. His wife 'll be oneasy about him."

"Oh well, that alters the case—the ladies must always be considered," said the placated giant. "Let me assist you, old Hammer-and-Anvil." So saying, he picked up the little hatter and flung him across the blacksmith's shoulder, where he hung limply, dangling arms and legs as the smith bore him away amid the cheers of the company.

The company now began to disperse, some perhaps hurried by the example of the poor hatter, others having no need of it. To whatever sort the fair giant belonged, he arose from his seat, towering above all others.

"Come, Stub, they've broke our trinity, so le's go tu bed—when I've pronounced the benediction." Then spreading out his brawny hands on a level with most heads, "The blessing of the Great Jehovah be upon this goodly company and upon this house—even unto that clerical gentleman over there, and especially upon all the Lord's anointed who intend going up into the wilderness to make it blossom like the rose."

"I'm no minister, Captain Allen, but a lawyer," said Capron.

"Ah, indeed, a scribe, not a Pharisee," said Allen. Good night, gentlemen. Come on, Stub," and with that took up a candle, and followed by his brother, strode away with a tread that made all the glasses ring.

"Now we're more by ourselves," said Capron, looking around the almost empty room with its clouds of wavering smoke and the unsnuffed candles gleaming dimly through them. "I'll make you an offer. I'll give you a deed o' this right o' land for ten pound, the balance of fifteen pounds to be paid in three notes on long time, to make it easy for you. If I wasn't in need of money, I wouldn't make sech a sacrifice. What do you say, Mr. Hill?"

"A pooty good chance," Dalrymple said, looking at Josiah, "n' if you're a mind' ter take it, I'll go 'long wi' ye, an' help ye build a log house, an' go snucks wi' ye on trappin', for the sake o' hev'in' company an' a place tu stay. Naow, what d'ye say?"

"I'll let ye know in ten minutes," said Josiah, after a few minutes pondering. "Is Mistress Chloe in the kitchen, Mr. Jarvis?" he asked the landlord, and upon an affirmative answer, arose and went out to the kitchen, where he found the buxom Chloe taking a final oversight of her finished labors.

"Why, Josier Hill!" she said, with an affectation of surprise, and a pout on her pretty lips that her smiling eyes belied, "I reckoned you wa'n't goin' tu gi' me a word this night, you was so took up wi' them hateful ol' men, an' your flip. That han'some Mr. Allen had more looks for me 'an what you had. My! hain't his eyes black, though!"

"Never you heed 'em, Chloe, they don't mean you no good," he said, taking both her hands in his and looking down at her with tender seriousness, "I hev got a word for ye, in sober airnest, an' I'll say it right naow wi'out no beatin' 'round the bush."

"Law, Josier, you 'most scare me, you look so solemn."

"It's solemn business. I'm thinkin' o' goin' up int' the New Hampshire Grants, an' makin' a pitch. If I du, an' git a home made ready for ye, snug an' comf'tble by a year from naow, will ye go an' share it wi' me? We've knowed each other since we was babies, an' hed ought tu know by naow whether we can stan' it together all aour lives. It won't be an easy life for a spell, but I'll du the best I can for ye, an' it'll go better arter a few years. It's a 'st'or'nary fine country up there, an' there's nothin' tu be feared on naow but natur' an' wild beasts, sence the war's over an' the Injuns quilled. Gi' me an answer, Chloe, an' if it's yes, I'll go, an' if it's no, I'll go, but I don't want tu make no pitch. For God's sake, say yes, if you can."

"Law, Josier, you're so sudden I hain't no breath tu answer you," she gasped, pale as a lily.

"You've knowed all along 'at I wanted ye, an' you'd ort tu know by naow whether you'll hev me or no."

"A year, you say?"

"Yes, in a year I'll come for ye."

"Well, then, yes. You knowed I couldn't say no when

you as 't. But it is an awful ways off to go, an' a lunsome life for a woman."

"It's lunsomer for a man all by hisself. I wouldn't never be lunsome wi' you."

"It's diff'nt wi' men. Well, it's a hull year fust, anyways!"

"Yes, an' I can du lots in a year, an' we'll be faithful an' true, Chloe."

"Faithful an' true, of course, we will, or least ways, I shall. There, you've taowsled my hair till it looks as if the witches hed been in it. Good night."

"Good night."

Josiah's companions exchanged significant glances when he returned to them within the appointed time, his face calmly radiant, and announced "It's a bargain, Mr. Capron, an' you may draw the writin's if you can show me a clear title."

Thereupon the lawyer produced a parchment duly conveying to him a certain right of land from one of the original grantees of the township of Lakefield on Lake Champlain in his Majesty's Province of New Hampshire. This being apparently correct, the lawyer proceeded to make another deed to Josiah Hill, which was signed by him, Anthony Capron, and witnessed by the landlord and Kenelm Dalrymple, to be acknowledged next day before a magistrate.

"I conclude you've found you a pardner, Mr. Hill," Capron said, slyly.

"Yes," Josiah answered, imperturbable, but for blushes. "Mr. Dalrymple here's a sort of a pardner."

Dalrymple took a final pull at his mug and then taking up the candle after snuffing it with his fingers, sucked the fluctuating flame into his black pipe until the heel was well ignited, and said:

"Wal, seein' aour business is all squared up, we might as well turn int'u aour blankets. Good night, gentlemen."

The hostler came in and blew out the candle in his tin lantern, and made up his bed in the bunk; the landlord carefully banked the coals in the fireplace; Josiah departed; the lawyer went to his room; the bar-room lapsed into silence and dim confusion of objects, as the flat cloud of tobacco smoke and the mixed fumes of the various liquors slowly drifted up the wide chimney.

ROWLAND E. ROBINSON.

With the Everglade Seminoles.

THE sportsman who wants adventure, game, glory and conquest may find all four in the Everglades of Florida; but the man who has hunted with the daring Seminole Indian will forever after feel the tameness of hunting under ordinary conditions. However fast the door of the swamp may be locked, it opens quickly enough to whomsoever carries the key. The Seminole is the true key-bearer, and with moccasined foot he enters when and where he will. The interior yet remains to the white man largely a terra incognita. The Everglades are simply immense streaks of long, low, level prairies covered for the most part with water, saw grass, dense vines, reeds and canes, and here and there dotted with little islands. This vast region comprises 4,000 square miles of tropical swamp. With an elevated position and a rare atmosphere the view that would meet the eye would differ from any other on the great globe. A thousand square miles of saw grass would be seen spreading out in the shape of an artist's palette. Toward the end would be seen a series of little inland lakes, fed by miniature rivers. Interblending with these lakes thousands of islands would be visible far beyond the saw grass sea. The flutter of bird life would be like the milky way at night, and the swarms of insects like a distant sandstorm in the desert. Bordering the sedgy lagoons are cabbage palms, India-rubber and mangroves, while tangled vegetation weaves itself in chaotic mass over underbrush and tree. These are the primeval woods of the United States. Like old sentinels, they stand, the deep roots seeming to hold the floating marsh in its place. The gloom and weirdness are enough to distract the strongest mind. Every tree is loaded down with the funeral moss, every log is moss-grown and decayed. The very cranes and herons, poised on one leg, look as mournful as the sprawling toad about to become their prey. Deer, bear and panther are plenty. The black fox skips nimbly from log to log and the gray wolf sneaks through the thickets, while the raccoon, the ne-groes' friend, creeps through the swamps and lives like an epicure on crabs and fish. The cry of the horn owl is heard and the far-reaching note of the curlew and flamingo. A mysterious smoke or mist hangs over the Everglades; as to its origin, all sorts of theories have been advanced, some going so far as to say that here is the crater of an old volcano that has in ages past been pushed up out of the sea just above its level and land formed around it. The Seminole Indians say it is the "smoke of the Great Spirit."

Some tourists hire the Indians who frequent civilization to guide them in hunts, but it is not poor Lo's idea to show the white man his hunting grounds; and he will take him around and around, always keeping out of sight of game with a cunning that would do credit to a Connecticut Yankee. Possessing that talisman, friendship and confidence of the Seminole chiefs, our hunter arranged for his first alligator hunt. To simplify the account of the tenderfoot's experience we will give it to the reader in his own words:

"Taking the little steamer Roseada at Kissimmee City, a two days' ride landed us at Bassinger, where I was met by an ox-cart, driven and owned by the Seminoles. A ride of forty miles, slow but sure, took us to the Indian village at Cow Creek. Here I was met by dogs, piccanninies, squaws and braves. The Seminole word of welcome was given, 'Ha-tu-eten-chu, hick-cha-hit-is chay' (glad to see you), and having survived it I commenced to unpack my provisions, causing the Indians to exclaim, 'White man eat plenty.' With time limited and eager for the hunt for big game, I rested but a few hours and then announced myself ready to 'hiepus' (go). In a cypress canoe, poled by Chief Tom Tiger Tail, with old Chief Tallahassee in the stern, we turned our boat toward the interior of the Everglades, and for three days traveled over as wild and weird a land as Stanley ever explored in Darkest Africa. Poling through water lilies, tall grass and overhanging branches, fre-

quently getting stuck in the shallow water and marsh, all gave more zest to the square mile than a hundred hunts in the North could do. The Indians have a keen sense of humor, and knowing I had never killed bear, deer or alligators, said: 'Indians have fun ojus, with white man,' and as they continued to laugh and talk together with significant looks, I took the spirit of the fun and asked the question, 'Nock-a-tel?' (what is it?) at every opportunity. As we poled along I enjoyed the sport with these childish friendly Indians and caught fish, too, as never before—till we were tired pulling them in. Coming upon an alligator asleep, Tallahassee said, 'Allapata, big sleep' (dead). I punched him and got dashed full of water as he disappeared under the surface of the water.

"One feature of the canoe trip worthy of note was the exhibition of Indian skill in throwing the spear and guiding the canoe at the same time. I could see no sign of life anywhere except the swaying of the large lily pods on top of the water. Whiz, went the spear with a long rope attached, and 30ft. away a great commotion was going on. Pulling in the rope, I saw a fine trout, which proved to weigh 12lbs. Time and again the Indian threw, always with the same success. Seeing is believing, otherwise it would not have been possible to have accredited the feat of Capt. Tom Tiger. Whiz, went the spear again, and drawing in the rope, no fish was attached. Laughingly I chided Tom for missing his mark. 'Me hit him—no kill—cut him.' I insisted not when an instant later the report of the rifle was heard and the daring chief had struck a large 'gator just between the eyes as he had seen him dart for the wounded fish speared but a moment before. With a dexterous pull of the pole we were soon alongside the alligator, and with a hook he was landed in the boat with the fish still clenched between his teeth. I could only exclaim, 'Glorious! wonderful!' The pride of the chief as he showed me the cut on the fish from his spear was greater than for all the trophies of the day, for he had silenced my contradictions and proved to me that 'Indians no lie.'

"Reaching the objective point of our trip, the Indians tied up the canoe and after a hearty repast we were ready for the alligator hunt. No game laws obstructed our progress, no signboards read, 'Penalty to trespassers,' and soon we were equipped for the night hunt. Leaving old Tallahassee to watch camp, with a bull's-eye lantern attached to my cap, I took my seat in the bow, while Tom Tiger, standing in the stern, propelled the canoe with long, dexterous strokes. Reaching a deep bayou, where the Seminoles kill hundreds of 'gators each year, I was directed to throw the light quietly over the water, and the presence of the saurian would be revealed by the reflection. Silently, slowly, our canoe cleaved the dark waters. Truly, the scene was worthy the pencil of a Doré. A moonless sky, a wild expanse of bleak water, a canoe propelled by a savage, splendid and careless in his unconscious grace, and as silent as the oarsman of the River Styx. Soon the dismal solitude was broken by our entrance into the alligator haunt. With stealthy glide through the still, dark water, we were soon aware of being near a very large 'gator, the two balls of fire shining in the darkness told the tale. Without a ripple the Indian glided his canoe within 10ft. of the monster, and a shot between the eyes from a .38 Winchester blew the top of its head into small pieces. Before the reptile could flounder out of reach the carcass was grabbed and pulled into the canoe by Tom Tiger, and the spinal cord was severed with an axe to prevent any future trouble.

At the first approach of our light the alligators gazed at it in the most fatuous manner, allowing the boat to approach within a very close position; but after one of their number had been slain they commenced a vibrating roaring, playing see-saw with their head and tail and slowly rolling forth their feelings in deep, thundering tones. To me, there seemed to be 500 alligators in that body of black water that night, and each and every one seemed to turn his burning eyes on my little searchlight—and they shone like stars. I could easily tell a big fellow by noticing if his glaring balls were close together or far apart. After killing four or five I called out 'Enough!' The picture was growing too gruesome. The quivering mass of reptiles in our canoe made me think longingly of home. 'Ungah' (all right), from the Indian reassured me, and the canoe was turned toward camp. During the evening the Indian chief had killed an 11ft. 'gator, and so lifeless did it seem when dragged into the canoe that it was not considered necessary to cut the neck and back. The extraordinary vitality of an alligator keeps it from dying for some time, the nerves often living for several hours after the head has been severed. Our canoe was loaded to the water's edge, with this large saurian in the bottom. Presently a low breathing greeted my ears; soon it grew louder, and a faint motion could be felt in the boat. Still I remained passive, the Indian poling through the deep, tortuous stream. I had instinctively drawn my feet up, when the great mouth, which was toward me, opened and began snapping angrily. His body began to writhe and twist and wriggle, which set all the other alligators in motion. The situation was growing critical and dangerous, when Capt. Tom, perceiving the trouble, came to the rescue with his axe, and none too soon, for the huge saurian began lashing his tail from side to side, and had the Indian been less skillful in handling the canoe we certainly would have been turned overboard. With the hideous cargo silenced, the Indian, always cool and nerveless, looked up, and with a humorous twinkle in his eye said, 'White man 'fraid ojus' (heap). Thus ended my first and last alligator hunt."

The fate of the alligator is already sealed. Thousands are killed every year for their hides and teeth, while other thousands are killed or wounded by the ambitious tourist. The alligators of Florida are a great attraction to visitors and should be protected just as the famous seals are at San Francisco. They are universal water scavengers, destroying snakes and rendering the coast countries safer to the hunter than the interior.

MINNIE MOORE-WILLSON.

KISSIMMEE, Fla.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Just About a Boy.—XXI.

"SAY, is all this country juss desert like it is here?" asked the boy, as he helped himself to his second cup of black coffee.

"Pretty much the same from here clear over to the Bighorn Mountains, then it changes to rough, mountain country, with plenty of good water, grass and timber in spots, until you get across into Idaho, then it is lava and sand with sage brush, and a little grass mixed in until the Cascade country begins, just across the Columbia River. Over on the Pacific side of that range it is hills and timber clear to the ocean."

"Gee! That's where I'd like to go! Seems s'ough this old desert is too much alike—all cactus 'n' horn toads 'n' things 'tull a feller gits plumb tired of 'em. Nen th' water up here's purt' near worsen whisky—guess that's why s' many fellers drinks whisky here too. Ain't no fishin' I reckon in a thousan' mild o' country like this nuther. What's suh use o' such country, anyhow?"

"Don't you see the cattle all around you? That's use, isn't it? The beef for half the country comes from these very hills, my boy, in spite of all this desert and desolation. There are men who live out their lives among these buttes and coulees, and fight the desert, the Indians, the varmints, water, rattlesnakes, heat and all—just to see that you have beei and plenty of it down in the States.

"There are thousands of wild things up here too; deer, antelope, bear, wolves and a host more than furnish meat, pelts or sport too—"

"We hain't seen but mighty few of 'em. Where do they range anyhow? Seem's like we'd dought to see somp'n moren kiotes in 'all the country we've been travelin', if they're so plenty."

"Well, in the first place, we are not hunting, for the season is not right, and in the next place, we have been following the trail. These wild things keep back in the hills and don't cross as plain a trail as we have been following unless they shift their feeding places. Do you see that blue line of hills off to the west, there? That is the divide between this river and the Powder, and it is a rough bit of country too—full of gulches and cedar patches, and with some pretty good springs scattered here and there through it, and it is a game country. Now, I'll tell you what I don't mind doing. We can drive up to Ward's ranch and visit with Ike and Phil this evening, and then if they happen to be out of meat we can all go hunting up Mt. Zahn way to-morrow, and get a blacktail buck for a change of grub. Mind you, no does, and not more than one buck, even if we see a dozen. Anything else besides deer and antelope you can call game unless we run into a bunch of elk or a stray buffalo or sheep—these we will let go, even if we get no deer—understand?"

"Uh-huh, I savie. Think we kin git a deer, do yeh? Gee, but I'd like to git a crack at a nold buck with a set o' horns like a plum thicket! Wouldn't I, though?"

"Well, you can have the chance, for I think I can just about put my finger on several unless the Indians have been raiding down through here or something else happened to drive the deer out. I know their runways up there all over that country, and I can find a buck without much trouble, I guess.

"Now, let's hook up and get to Ward's, for the sun is getting up, and it is a big twenty miles from here to that line of hills and Ward's cabin is in the flat just this side of the hills."

Soon our outfit wended its crooked way across the desolate landscape that basked in the first rays of the early sun.

It was still cool and delightful and the boy was all animation and chatter as we went along, following the gray thread of a trail that wandered up and down, twisting back against the bluffs to cross some little cañon, then curving back toward Donkey Creek again as though it was afraid to lose sight of that miserable little excuse for a water course.

There is always a companionship some way about a stream and a trail, and they keep close company wherever they can in the wilderness, be it desert, woods or mountains.

"What's all them rocks 'n a circle that way for?" suddenly asked the youngster, as he noted them beside the trail.

"Teepee rings," I answered. "What you see there is a sign, a record, of a past camp, where some Indians have pitched their teepee—probably for a few days, while hunting or just traveling. The rocks were piled around the lower edge of the teepee skins—the tent walls, you know—and when the teepee was taken down the rocks were simply rolled off of the edge of the skins, so they remained in a circle, just as the squaws left them when they folded up their house and vanished. See, there are more of them over there, too—there has been a hunting party here in all probability, but it was a year or over ago, for you see the grass has grown up against the rocks and browned there, and there is new grass growing around them again."

"That's th' way they do up here, huh? Don't use no tent pins—juss roll rocks onto th' bottom o' th' tent 'n' hole it down that way? Well, that ain't a bad idee nuther, 'n' a feller will find out things as he goes along, won't he?"

"What's them white spots 'way over 'n that flat crost th' creek?"

"Antelope. Take the glass and count them."

"Gee, they's a whole bunch of 'em, 'bout forty or fifty, I reckon—'n' they's a lot more 'way on up—'n' more on th' side o' th' hill! Gee! They's a whole herd of 'em! Lot o' big bucks 'mongst 'em, too—I kin see their hqorns—little black shiny ones that curl back 'n' end in a kind o' a hook, nen they's a little prong, looks like, juss above 'ur eye. Gee, they are purty, ain't they? Less git one o' them bucks."

"Do you want to shoot one of them or wait for a black-tail buck in the morning?"

The boy looked through the glass again; then heaved a big sigh. "Guess I'd druther wait—but they's a mighty big buck in that bunch," he said.

A few moments later we drove in between the hills and

lost sight of the bunch of antelope, so the boy had to hunt something else to interest him.

He asked about the big slag boulders that littered the country, and had to hear the whole geology of the edge of the bad lines before he was satisfied; then it was points on the poison of the centipede that interested him; then prairie dogs came in to the conversation, and he freely expressed his contempt for the theory that they did without water and lived pleasantly in company with owls and rattlesnakes.

"Ain't I killed more 'n one ole rattler with a belly full o' young prairie dogs? You bet, I have, 'n' nobody wants to tell me 'at dogs lives right 'long 'n th' same holes 'ith snakes—I know better. Th' rattler ain't doin' nothin' but huntin' pups when he calls on a fambly o' dogs, nen when he's et up all he kin swaller comf'table he crawls out 'n th' sun 'n' goes to sleep fer true, 'n' nen's when I git him."

While he was dilating on the subject of prairie dogs we drove out from the hills and began to cross the last flat before reaching Ward's place, and by 2 o'clock we had hailed those worthy brothers and introduced each other there on the hot desert.

Our team was soon taken care of, and we enjoyed our first meal that was cooked over a stove for many days when we sat down in the rough cabin so far from people and things.

After dinner our pipes were lit and we sprawled at length across some buffalo robes flung on the ground where the shadow fell north of the cabin, and there we talked the lore of the desert and planned to kill a big buck on the morrow, for we were a healthy company, with a longing for the juicy steaks of venison.

"Reckon we'd best go too-ward th' red buttes north o' hyer airly 'n th' mornin', C'manch," said big Ike Ward as he looked up into the sky from his point of vantage on the flat of his back across the big buffalo robe.

The blue smoke curled upward from his black pipe, his long hair curled about his square features, and one leg rocked up and down across the other bent knee, as Ike unfolded the plan for to-morrow, a plan that meant the ending of the days for one big buck, for Ike was a man who took one, or not more than two cartridges when he went after deer, and he always got meat, too.

I've seen him shoot, and it is a nice bit of action—just as cool and easy as though his target was as big as a house and standing still, instead of a blue buck no bigger than your hand, bouncing across a rough hillside 500yds. away—just bouncing like a blue rubber ball for a few moments, then when the gun spits its lead and the dust flew against the hillside, the buck fell headlong, and did not rise. Then Ike would wipe the smoke out of the barrel and take a fresh nip of tobacco and go to the buck. That was the man who outlined the way that the buck was to die to-morrow.

"Ef we don't ketch one clost to th' spring, we'll hunt into them cedar cañons where th' lion like to fetched Phil th' time he got th' bull elk up there; reckon we cain't miss a-gittin' one in thar shore—'n' git back 'fore it gits hot, too."

And so it was planned.

"How was it about Phil and the lion, Ike?" I asked.

"Ast Phil," chuckled big Ike. But that is another story.

EL COMANCHO.

Three Brief Notes.

IN regard to the former abundance of salmon in certain streams of our country, where they are now rare, several references to which have appeared of late in FOREST AND STREAM, the same conditions would seem to prevail in other quarters of the world. In reading again very recently Scott's "Old Mortality," my attention was called to the following in the description of the dinner at Milnwood, in the eighth chapter: "A large boiled salmon would nowadays have indicated more liberal house-keeping; but at that period salmon was caught in such plenty in the considerable rivers in Scotland, that instead of being accounted a delicacy, it was generally applied to feed the servants, who are said sometimes to have stipulated that they should not be required to eat a food so luscious and surfeiting in its quality above five times a week." The "period" referred to was the latter part of the seventeenth century; the "nowadays" was the early part of the nineteenth century, "Old Mortality" having been first published in the year 1816; so that in the course of a century the salmon in Scotland would appear to have been reduced in numbers from abundance to comparative scarcity.

I have no desire to take a hand in the scrap now going on among the brethren in reference to the intelligence of animals; but I don't see how a man that has ever seen a dog can doubt that creature's intelligence. His every act would indicate the possession of mental faculties—not perhaps the clear intellect of the cultivated man, though the same in kind; perhaps only the feeble, confused, half-sentient gropings of a little child. I not only believe that the dog possesses certain intellectual faculties—memory, reason, imagination, will, etc.—but to some extent a moral nature—the feelings of affection, of gratitude, of anger, of jealousy, of resentment, of modesty, of shame. I am not naming these things at random; I am guarding my words as I write. Even Dr. Thomas Reid, who wrote under the old dispensation, thinks that the desire of esteem, of power, and of knowledge, exists in "some degree in brute animals of the more sagacious kind." The very term "more sagacious" implies differences in mental acumen, in discernment and judgment, and hence an intellectual system. But, as Hamlet says, "Too much of this."

Emerson is so well known as a philosopher and essayist, that we seldom think of him as a poet, and still more rarely as a naturalist, yet in his degree he is as distinctively the poet of nature as is Wordsworth. His "Monadnock," "Musketaquid," and "Woodnotes" are full of the love of forest and stream. What can be more poetically beautiful than

"April's bird

Blue-coated, flying before from tree to tree"—

or,

"Yonder ragged cliff

Has thousand faces in a thousand hours?"

But I do not propose to compile the beauties of Emerson. I might as well republish the book at once. But I would call attention particularly to his sketch of his friend Thoreau, in "Woodnotes." A finer tribute was never made to a man:

"And such I knew, a forest seer,
A minstrel of the natural year,
Foreteller of the vernal ides,
Wise harbinger of spheres and tides,
A lover true, who knew by heart,
Each joy the mountain dales impart."

It is, of course, too long to quote in full. I only desire to direct the attention of the lover of nature and of poetry to this great man's tribute to one who was well worthy of it:

"In unploughed Maine he sought the lumberer's gang,
Where from a hundred lakes young rivers sprang;
He trod the unplanted forest floor, whereon
The all-seeing sun for ages hath not shone;
Through these green tents, by eldest Nature dressed,
He roamed, content, alike with man and beast—
Where darkness found him he lay glad at night;
There the red morning touched him with its light."

Such was Thoreau, the man who surveyed lands for a living and read the Iliad in the original for recreation; but above all, one who worshipped in nature's inner sanctuary, and who seemed to have entered into a league with the birds of the air, the creatures of the forest, and the denizens of the streams. The squirrels came down from the trees and climbed over his shoulders, and he could take up fish out of the water in his hands. See how he justified his employments: "Bending my steps again to the pond," he says, "my haste to catch pickerel, wading in retired meadows, in sloughs and bog holes, in forlorn and savage places, appeared for an instant trivial to me who had been sent to school and college; but as I ran down the hill toward the reddening west, with the rainbow over my shoulder, and some faint tinkling sounds borne to my ear through the cleansed air, from I know not what quarter, my good genius seemed to say, 'Go fish and hunt far and wide day by day—farther and wider—and rest thee by many brooks and hearth-sides without misgiving. Remember thy Creator in the days of thy youth. Rise free from care before the dawn, and seek adventures. Let the noon find thee by other lakes, and the night overtake thee everywhere at home. There are no larger fields than these, no worthier games than may here be played. Grow wild according to thy nature, like these sedges and brakes, which will never become English hay. Let the thunder rumble; what if it threaten ruin to farmers' crops? That is not its errand to thee. Take shelter under the cloud, while they flee to carts and sheds. Let not to get a living be thy trade, but thy sport. Enjoy the land, but own it not."

Hawthorne was the intimate friend of Thoreau, and in more than one place in his "American Note Books" and "The Old Manse," he introduces him. "He is a keen and delicate observer of nature—a genuine observer—which, I suspect," says Hawthorne, "is almost as rare a character as even an original poet; and nature, in return for her love, seems to adopt him as her especial child, and shows him secrets which few others are allowed to witness. He is familiar with beast, fish, fowl and reptile, and has strange stories to tell of adventures and friendly passages with these lower brethren of mortality. Herb and flower, likewise, wherever they grow, whether in garden or wild-wood, are his familiar friends. He is also on intimate terms with the clouds, and can tell the portents of storms; and, strange to say, he seldom walks over a ploughed field without picking up an arrow point, spear head, or other relic of the red man, as if their spirit willed him to be the inheritor of their simple wealth. With all this he has more than a tincture of literature—a deep and true taste for poetry, especially for the elder poets, and he is a good writer. I find him a healthy and wholesome man to know." To hold intercourse with Thoreau, he says, "is like hearing the wind among the boughs of a forest tree."

Nessmuk should have known Thoreau.

T. J. CHAPMAN.

Natural History.

Pikas and Marmots.

For several years past I had a strong desire to invade the haunts of the pikas, to study their habits and collect specimens, but it was not until the close of July, 1898, that my brother and I found ourselves snugly camped in the Canadian National Park, Alberta, within a few miles of the beautiful Lake Minnewonka, or Devil's Lake, and within close proximity to the haunts of the little chief hare. The weather was extremely hot in the daytime, and made climbing hard work, but my intense interest to become acquainted with the pika was the foundation for the necessary energy, and early in the morning of Aug. 6 we started for the base of Mount Ingham, at the southeast corner of the lake.

The first few miles we had comfortable walking along a good road, but soon we found it necessary to strike eastward, and here our troubles began. In the course of fifteen or twenty minutes we were seemingly, hopelessly entangled in a swamp, surrounded by a small but very businesslike crowd of mosquitoes, and firmly convinced that we must retrace our steps and try some other way. A high dry ridge a little further to the south proved much better "navigation," and another hour found us at the base of the slope, my brother suggesting that a flying machine or a balloon would be very useful.

However, two and a half hours' hard climbing, with the sun's rays scorching our faces, and, incidentally, numerous halts to take breath and admire the vast panorama of mountains and valleys with streams like silver threads in the distance, and we near a large spur of volcanic rocky ground, with a thin growth of stunted pines, from whence loud and echoing whistles come, and instill more energy into us.

As I expected, the hoary marmots were the animals that made the sounds. I shortly caught sight of the first

one as he sat bolt upright upon the top of a rock, sending his shrill whistle echoing across the cañon, to be replied to by others scattered everywhere amongst the rocks. They were often seen by us progressing by a clumsy gallop from point to point. I found it extremely difficult to advance near enough to use a shotgun with effect. The animal generally plunges out of sight, just as you imagine he is close enough. They also seem to possess the knack of seeing you at the other side of the biggest rock you can skirmish behind.

This day not a specimen was obtained, but upon another occasion, I marked a fine grizzly old fellow as he disappeared into a burrow under a large rock, and ensconcing myself securely from view, behind a gnarled old pine tree, about 35 yds. from his doorstep, and lighting my pipe, I settled down for a siege. A Rocky Mountain jay found me out, and was very attentive for some time, viewing me from every point, and occasionally venturing within a very few yards. My thoughts were wandering from hoary marmots, and the hot sun making me drowsy, when a sudden subterranean whistle, and in an instant I was all eyes and ears. Another moment and the marmot's gray head protruded from his burrow as he surveyed the landscape with a keen eye, everything was silent and still. He presently walked to the top of his rock, sat up on his haunches and sent a shrill whistle vibrating through the air, blissfully ignorant of his fate, for my old 12-bore stretched him lifeless on the rock the next moment.

But to return to Aug. 6; as we advanced and the mar-

BEAVER DAM IN THE NATIONAL ZOOLOGICAL PARK IN WASHINGTON.

nots disappeared, our attention was drawn to another and more peculiar cry, somewhat like *ce-ce*, repeated quickly and at short intervals.

While gazing intently at the top of a rock a short distance away from where the sound was apparently issuing, I suddenly make out the form of a diminutive little animal, opening and shutting its mouth at short intervals and emitting this *e-e*. In my eagerness to get a closer view I made a stumble, and the little animal disappeared like a flash, and I found I had a shotgun in my hand. My brother, who had wandered away, appeared at this moment, with the first pika, and it was with great interest that I examined the specimen. Averaging from 6 to 7 in. in length, with short legs, the soles of the feet thickly furred, large round ears, and apparently no tail. The pika is a peculiar and interesting little mammal in the skeleton. The tail vertebrae measures less than half an inch. After this introduction, I found no difficulty in observing them and collecting what specimens I desired. The greatest difficulty experienced was that often when shot, they fall into the crevices of the rocks and considerable excavating is sometimes necessary before the specimen is secured.

While watching a rock slide, one little fellow suddenly appeared not more than 10 or 12 ft. away, and commenced eating a short moss that grows in patches on the rocks. I was watching it perfectly motionless, when it paused and seemed to reflect, the next moment starting away at a most astonishing speed, considering the nature of the ground, leaping from rock to rock with extraordinary agility, as if it had suddenly remembered some very important engagement.

Pikas are busy and industrious creatures, traveling here and there over the rock slides, feeding upon the arctic plants that grow in patches everywhere, and storing up quantities of food in the rocks, proving, no doubt, that they do not hibernate, but remain active all winter.

The altitude of the lowest colony we discovered was about 6,000 ft., amongst a growth of stunted pine trees, the marmots inhabiting the same ground. We climbed to an altitude of close upon 9,000 ft., and found them scattered everywhere, their cries being heard in every direction, and numerous stores of their "hay" were found in the spaces between the rocks.

After an equally tedious downward climb, we reached the road, and then our camp, most thoroughly tired and hungry, but a red-letter day added to the many others of my field collecting experiences in Northwest Canada.

G. F. DIPPIE.

TORONTO, Canada

John.

JOHN first saw the light in the heart of the Canadian forest. He had a mate of about the same age and of the other sex. Both were captured while very young, and, against their will taken to the main camp of the Laurentian Club on the shore of Lac la Pêche. They were given ample accommodations—a suitable house and spacious grounds, sheltered by trees and inclosed by a high stockade of logs; for John and his companion were caribous, and if unrestrained would have bounded away to their native haunts.

Here for three or four years they lived and grew and thrived, and were an interesting part of the camp life.

In summer they seemed to be best satisfied when browsing on the tender leaves of the trees, especially of the maple that grew luxuriantly all about in clumps. In the winter the guardian fed them with dried grass and cereals.

One spring morning John's mate, who apparently had not forgotten her early free life, forced a way through the stockade and escaped, and John was left alone, a deserted husband. Whether he forgave and forgot he never told, but he soon recovered his spirits and ate and flourished and frolicked. He became somewhat more docile, and when called by name, would cross the deep stream that flowed lazily through his park and come to take the clover and the boughs from the hands of his friends.

Each autumn when the leaves fell his antlers fell; and

each spring when the leaves unfolded a new soft pair sprang magically in velvet from his head. His coat became richer in color, the white on his chest whiter, and the gray on his sides more glossy.

Then happened the Sportsman's Show of the year 1899 in the far-away city of New York. What had John to do with that? What interest had he, a child of the Northern wilderness, a Canadian caribou, in Madison Square Garden, in its throngs of people, its babel of noises, its blazing electric lights, its restless comings and goings? What had he in common with the civilization of the city?

Surely nothing; but he was only John the caribou, a captive, and when the managing director spoke the word, John, with some physical protests and remnants of wild energy, stepped into the cage and was carried express to the Garden, stopping on the border line of his native land long enough to pay the duty of \$20, which the United States imposed upon him as a caribou who came without intent to return.

And now appears the interesting feature of John's character. Wilderness-born, wilderness-bred, half-wild, notwithstanding his period of captivity, yet when he entered the brilliantly lighted amphitheater and took possession of his inclosure, in the center of the building, surrounded by crowds of people, walking to and fro, impertinently staring at him, the air full of sounds of human voices, blare of trumpets, beating of drums, cries and turmoil, John was absolutely undisturbed. He betrayed neither fear nor curiosity. He walked about quietly as he did in his own forest close; ate, drank, laid himself down to rest, imperturbable and serene. What self-control and mastery he had! It was not that he was stupid or dull, for he was an alert animal, watchful, wakeful, full of life.

His days passed uneventfully at the Show. He was placarded as the "Bull caribou from the Laurentian Club," and was gazed at and admired, but except to his old friends of the club his history was unknown, and the throngs only saw an interesting specimen of wild life.

He was sold to a stranger. There is no record of his owner or of his new habitat, but he will always be remembered as one of "the wild animals I have known."

Death from Snake Bite.

YUMA, ARIZ., May 1.—*Editor Forest and Stream:* March 17 an Apache Indian was bitten by a rattlesnake. He was a convict, a twenty-five-year man, and was at work on the prison farm about two miles distant. So far as I can learn he was in the act of striking at a small mammal with a stick when the snake rattled and almost at the same instant struck him about the middle of the left forearm. The reptile was evidently a large one, as the fang punctures were nearly an inch and a quarter apart. Beyond placing his arm in a sling the wounded man did nothing till he reported at the prison hospital about half an hour later. The punctures were large and had, judging by the coagulated blood on the arm, bled rather freely. Pending the arrival of the prison physician a tourniquet was put on above the elbow and the wound washed with ammonia. The swelling had not at this time passed the elbow and the pain was less intense than it became afterward. On arrival of the doctor, a few minutes later, he ordered a solution of permanganate of potassium, and endeavored to renew the bleeding by cutting deep into the wounds. This was, of course largely prevented by the tourniquet, but he managed to press out a little black blood from the incisions. The solution was then hypodermically injected deep under each wound, the tourniquet taken off and the patient put to bed. A cloth saturated with the solution was kept to the arm throughout the afternoon and following night. It was about 2 P. M. when the man was put to bed, and he was then resting comparatively easy, but by 7 P. M. he was suffering intensely, and represented the action of his heart by violent opening and closing of his hand. The skin had sluffed from the wound, the arm was black and the swelling had extended well up into the shoulder. The doctor then decided to give him whisky, and nearly a quart was administered before any effect was observable. Finally he began to express gratitude for what was being done for him, and to talk of the days when he "was a good man and a scout." By 8 o'clock he was asleep, and we all thought the danger past. I did not see him again till 5 o'clock next morning. At that time he was still sleeping, but his breathing was short and jerky. Pulse he had none, although his flesh was moist and warm. The doctor was called and attempted to administer a small dose of ammonia, but the throat seemed paralyzed and refused to act. An effort to work it down with the fingers but partially succeeded. Ammonia was also held to the nostrils, but it produced no apparent change in his condition, and by 7 o'clock he was dead. The body did not, however, become rigid till some hours later.

His death was a surprise to me, for I shared the common belief that intoxication in such cases was a sure antidote, but in this it did not prove correct. At first the indications were that his stomach would refuse the whisky, but by administering small doses at intervals of three to five minutes the whole amount was retained, and in less than an hour he was asleep.

He was a San Carlos Apache, twenty-eight years old and weighed 150lbs. His health was fairly good, and there was every reason to suppose he would pull through all right. Indian-like, he made no complaint, and although the perspiration stood in large drops on his forehead, he did not move or twitch a muscle while the doctor was lancing and dressing the wounds, but later he asked that a couple of his Indian friends be allowed to sit with him. His mother was advised of his death, and also that he had one dollar to his credit on the prison books. Her reply was, "Sorry my boy dead. Suppose it couldn't be helped. Send me the dollar."

The prison physician, Dr. Moeller, stated that during his practice in Texas and Arizona he had attended eleven other such cases and had not lost any of them, although one suffered the loss of several fingers and the use of one arm.

H. B.

[Accounts of death from snake bite are not unusual, but each account giving accurate details like the above has a value, and is worth putting on record. The inefficacy of permanganate of potash as an antidote in this case is of interest.]

More about the Eagle.

CAPT. E. B. GALLUP, of Havre de Grace, Md., who sends us many quaint notes from that game abounding country, tells us that some of his friends have intimated that his recent reflections upon the American eagle must have come from the pen of one who was not a native-born American. The Captain is jealous of his Americanism, and sends us his pedigree, adding some interesting notes on the ways of birds. He writes:

I am a descendant of one of many very old families living in this country. The history of the Gallups records that two brothers of that name, John and Elisha, of French lineage, came to this country sometime before the death of Oliver Cromwell and the restoration of Charles II.; and in Cooper's naval history may be found an account of the first water battle ever fought in the waters of the northern part of the continent. This engagement was fought with the Indians in the Narragansett Bay about the year 1660, and old John Gallup was in command. He defeated the Indians and captured their vessel. I am the oldest sprout now living of the fourth generation of the seed of old John Gallup, the great Indian fighter. My father, Thomas Gallup, lived on the lonely Spesutia Island in the headwaters of the Chesapeake Bay, where I was born in the year 1820. I was on ducks and birds and fish of all kinds, and frogs, muskrats and snapping turtles. I have been a sport and pot-hunter for seventy years; for I commenced to shoot when I was only ten years old, and supplied all the family with game of all kinds. All that we could not consume we had to throw away, as there was no market for game nearer than Baltimore; and it was a day's journey with a good team to reach Baltimore; and ducks and birds of all kinds in those days were so numerous in Maryland that it would not pay to drive a team to Baltimore with game. After following the business of being a sport and pot-hunter for seventy years, I claim to know as much about the history and character of all kinds of birds found in this country as any man living; and I have no hesitation in saying to the gentleman that would like to bring a charge against me for speaking slightly

of Uncle Sam's pet bird, I believe in giving the devil his due. The eagle can fly higher and come down faster than all other birds to be found in the country. During my life I have seen more than fifty times an eagle chase a fishing hawk with a fish in his claws and make him drop the fish, when the eagle would get under the fish and turn his back down and open his large claws and grab the fish before it reached the water. This does not look reasonable, but it is true.

In calm weather it is no trouble for an eagle to capture a wounded duck. I have watched them many times chasing a wounded duck. When the duck would dive under the water the eagle would see in what direction his bill was pointed, and when the duck would come to the top of the water to get air the eagle would make a dart at him and would soon worry his victim out of breath and capture him. I was once hidden behind a blind and saw an eagle capture a wounded duck. He came near enough for me to tickle him with some small shot, and he dropped the duck. When I went and picked it up I found that he had bitten several big mouthfuls of flesh out of the duck while flying for the land, and the duck still had life in it when I picked it up.

During my long acquaintance with the eagles, I have never known them to associate with but two families of birds in this country, and those the ones considered the very lowest—turkey buzzards and crows. When the buzzards and crows find a dead carcass they send a special invitation to the eagle to come and dine with them; and not a buzzard nor crow is allowed to come to the first table, but must take a back seat until the eagle family gets enough. Many times have I seen the eagle feasting on a carcass and the buzzards and crows sitting a distance off waiting until the eagle gets enough.

CAPT. E. B. GALLUP.

The Danger of Introducing Noxious Animals and Birds.

BY T. S. PALMER, ASSISTANT CHIEF OF BIOLOGICAL SURVEY.
From the Yearbook of the Department of Agriculture.

ACCLIMATIZATION of plants and animals has attracted attention in all parts of the world. Useful or curious species have been introduced from one country to another with varying degrees of success; some have failed while others have become acclimated, and occasionally have increased to such an extent as to usurp the places of native species. In comparing the results of the introduction of plants and of animals, the important difference between these two classes of experiments should not be lost sight of. Plants, on the one hand, are introduced almost without exception for purposes of cultivation, and are therefore kept somewhat under control. Occasionally, under favorable conditions, they "escape" and increase so rapidly that they become troublesome weeds. Chicory and wild garlic of the Eastern States and the water hyacinth of Florida are familiar examples of weeds originally introduced as useful or ornamental plants. Animals, on the contrary, unless intended for pets or for exhibition in menageries or zoological gardens, are seldom kept in captivity, but are liberated and allowed to live as nearly as possible under natural conditions. Only the strongest and hardiest species survive, and in adapting themselves to new surroundings necessarily cause some change in the existing fauna. If prolific, they are likely to become abundant in a short time; if they crowd out indigenous species, they are regarded as nuisances. Hence, it is sometimes said that acclimatization of animals has produced far less satisfactory results than that of plants, but the comparison is made between the relatively small number of animals, birds, and insects purposely imported and allowed to run wild, and a long list of useful and ornamental plants carefully kept under cultivation.

Means of Dispersal.

Animals are transported from one country to another or to distant islands, either by accident or by the direct agency of man. Horses, cattle, sheep, goats, pigs, dogs and cats are now almost cosmopolitan, but they owe their wide distribution entirely to man, who has carried them with him to all parts of the earth. Accidental distribution is much less common in the case of mammals and birds than among the smaller plants and insects, and species which have gained a foothold in distant lands have almost always been intentionally introduced.

Certain small mammals have, however, accidentally found their way in vessels from one port to another. Two or three species of rats and the house mouse of Europe have thus become widely dispersed over the globe. Fruit vessels plying between ports of the United States and Central or South America occasionally bring snakes, small mammals, and insects in bunches of bananas. In November, 1895, a Central American mouse, of the genus *Oryzomys*, concealed in a bunch of bananas shipped from Puerto Limon, Costa Rica, was captured alive in a commission house in Washington, D. C. A young murine opossum from tropical America was discovered in a bunch of bananas at Ames, Iowa, during the summer of 1882, and was kept alive for some time. If such cases were frequent, it can be readily seen how a species gain a foothold in new regions, provided the conditions were favorable for its increase.

During the last fifteen or twenty years Bering Island, one of the Commander group in Bering Sea, has been overrun by the common Siberian red-backed mouse (*Eutamias rutilus*). This species was formerly unknown on the islands, but has been introduced since 1870, probably in firewood brought from Kamchatka. Within ten years it spread all over the island from the beaches to the mountains in the interior. It occurs both in the swamps and on the sand dunes, and has become a pest in the huts of the natives. In 1889 it was still confined to Bering Island, but will probably reach Copper Island in time.

Domesticated Species May Become Noxious.

Domesticated animals, like cultivated plants, may run wild and become so abundant as to be extremely injurious. Wild horses are said to have become so numerous in some parts of Australia that they consume the feed needed for sheep and other animals, and hunters are employed to

shoot them. In some of the Western States they have also become a nuisance, and in Nevada a law was passed in 1897 permitting wild horses to be shot. Recent reports from Washington indicate that cayuses are considered of so little value that they are killed and used for bait in poisoning wolves and coyotes.

Pigs have run wild in some of the Southern States and also on certain islands, where, as on the Galapagos, they were originally introduced to furnish food for crews of vessels in need of fresh meat. According to Dr. Finsch,¹ they were introduced into New Zealand by Captain Cook about 1770, and soon becoming wild, increased to a remarkable degree. A century later wild pigs were so abundant in the flax thickets of the Province of Taranaki, on the North Island that a hunter could shoot fifty in a single day. Dr. Finsch also cites a case mentioned by Hochstetter in which 25,000 wild pigs were said to have been killed by three hundreds in less than two years.

Sheep and goats when numerous are likely to cause widespread injury, particularly in forested regions. An instructive example of the damage done by goats is that on St. Helena, described by Wallace.² St. Helena is a mountainous island scarcely fifty square miles in extent, and its highest summits reach an elevation of 2,700ft. At the time of its discovery, about the beginning of the sixteenth century, it is said to have been covered by a dense forest; to-day it is described as a comparatively barren rocky desert. This change has been largely brought about by goats first introduced by the Portuguese in 1513, and which multiplied so fast that in seventy-five years they existed by thousands. Browsing on the young trees and shrubs, they rapidly brought about the destruction of the vegetation which protected the steep slopes. With the disappearance of the undergrowth, began the washing of the soil by tropical rains and the destruction of the forests. In 1709 the governor reported that the timber was rapidly disappearing, and that the goats should be destroyed if the forests were to be preserved. This advice was not heeded, and only a century later, in 1810, another governor reported the total destruction of the forests by the goats, and in consequence an expense of \$13,600 (£2,729) in one year for the importation of fuel for Government use.

The Santa Barbara Islands, off the coast of southern California, and the Island of Guadalupe, off the Lower California coast, are utilized as ranges for goats. All these islands are dry and more or less covered with brush, but arborescent vegetation is comparatively scarce. The goats practically run wild, and already exist in considerable numbers. On Santa Catalina, one of the Santa Barbara group, wild goat hunting is one of the diversions afforded tourists, and is considered one of the principal attractions of this popular summer resort. As yet the goats have not been on the islands long enough to cause any serious effects on the vegetation, and they may never bring about the ruin which has been wrought on St. Helena. But it is scarcely possible for the islands to be grazed by goats for an indefinite length of time without suffering serious damage.

House cats are often greater pests than commonly supposed. When numerous about the suburbs of cities and towns, they are apt to forage for a living either from necessity or choice, and their food is by no means confined to rats and mice. They are constantly on the watch for birds, but it is impossible even to estimate how many they destroy. It is certain, however, that in some places the decrease in native birds is largely due to their presence. Where cats have run wild on isolated islands, their work can be more readily appreciated. On Sable Island, off the coast of Nova Scotia, they were introduced about 1880 and rapidly exterminated the rabbits, which had been in possession of the island for half a century. In one of the harbors of Kerguelen Island, southeast of the Cape of Good Hope, cats were allowed to run wild upon a little islet known as Cat Island, which has been used as a wintering place for sealers for many years. Here they live in holes in the ground, preying upon sea birds and their young, and are said to have developed such extraordinary ferocity that it is almost impossible to tame them even when captured young. Dr. W. L. Abbott states that on Aldabra, about 200 miles northwest of Madagascar, cats are common on the main island, and have completely exterminated the flightless rail (*Rougetius aldarbranus*), an interesting bird, peculiar to this group of islands. They are also numerous on Glorioso Island, 120 miles to the southeast, and in consequence birds are less common even than on Aldabra.³

The Chatham Islands, 500 miles east of New Zealand, were colonized about fifty years ago; cats, dogs, and pigs were introduced, and the native birds, represented by fifty-five species, including thirteen not found elsewhere, have since greatly decreased in numbers. Two of the most interesting birds are land rails of the genus *Cabalus*. Dr. Dieffenbach, naturalist of the New Zealand Company, who visited the islands in 1840, states that one of these rails (*Cabalus dieffenbachii*), called by the natives "meriki," was formerly common, but since the introduction of cats and dogs it has become very scarce. It is now probably extinct, and the closely related species *C. modestus* will doubtless soon suffer a similar fate, since the islet of Mangare, to which it is confined, has recently been invaded by cats.⁴

Sources of Danger from Noxious Species.

The animals and birds which have thus far become most troublesome when introduced into foreign lands are nearly all natives of the Old World. The mammals belong to three orders: (1) Rodents, including rats of two or three species, the house mouse, and rabbit of western Asia or southern Europe; (2) Carnivores, represented by the stoat, weasel, and common house cat of Europe, and the mongoose of India; (3) Chiroptera, represented by large fruit-eating bats or flying foxes of Australia and the Malay Archipelago. Flying foxes have not yet been actually introduced, but are likely to be carried to different islands in the Pacific, and are dangerous because of their depredations on fruit. The birds comprise the house sparrow and starling of Europe, and the minn of India. Other species, usually regarded as beneficial in their native homes, such as the European skylark, green linnet,

⁴ Forbes, Ibis, 6th ser., V., 1893, pp. 523, 531-533.

black thrush or blackbird, and the great titmouse or kohlmeise, are likely to prove injurious in new surroundings. Most of these species have extended their range from the east toward the west, although the minas have been carried in the opposite direction to New Zealand and the Hawaiian Islands, and flying foxes are likely to extend northward and eastward. The main danger for the United States lies in species native to central and southern Europe and western Asia, but tropical species, particularly of India, might become acclimated in the Southern States. In order to show how these animals and birds have already spread, and the damage they have done, it will be necessary to refer briefly to the history of each species.

Rats and Mice.

Rats and mice are among the greatest pests with which man has to contend, and the annoyance and damage which they occasion are beyond computation. They are ubiquitous, abundant alike in the largest cities and on the most distant islands of the sea. They have not been intentionally introduced anywhere, but have found their way by means of vessels to all parts of the earth. Small islands, populated with rats from wrecks, or otherwise, are occasionally overrun by these animals. On the island of Aldabra, already mentioned, rats fairly swarm, and are very destructive to the gigantic native land tortoise, eating the young as soon as they are hatched. Sable island, off the coast of Nova Scotia, has suffered from several plagues of rats, and it is said that the first superintendent of the light station and his men were at one time threatened with starvation owing to the inroads made on their stores by rats.

The Common Brown Rat.—The common brown rat, known also as the wharf rat and Norway rat (*Mus decumanus*), was originally a native of western China, and until 200 years ago was unknown in Europe or America. It is very prolific, producing from four to twelve young at a birth several times a year, and has spread so rapidly that at the present time it is nearly cosmopolitan. In the autumn of 1727 large numbers of brown rats entered Europe by swimming across the Volga, and, gaining a foothold in the Province of Astrakhan in eastern Russia, spread westward over central Europe. Five years later (1732) they reached England by vessels from western India. The brown rat appeared in east Prussia about 1750, and in Denmark and Switzerland in 1809. It reached the eastern coast of the United States about 1775, and in 1825, according to Sir John Richardson, had extended as far west in Canada as Kingston, Ontario. By 1855 it was abundant at several points on the Pacific Coast, including San Francisco, Cal.; Astoria, Ore., and Steilacoon, Wash., and its range on the west coast now extends as far north as Alaska, at Sitka, Kodiak and even Unalaska. At the present time it is probably abundant in all the larger cities of the United States except in the South, where it is replaced by another species.

The Black, or House, Rat.—The black rat, or house rat (*Mus rattus*), was in all probability originally a native of Asia. The time of its introduction into Europe is uncertain, but in the middle ages it was the common house rat of central Europe. The date of its introduction into the New World is placed as early as 1544, or more than 200 years previous to that of the brown rat. It evidently became very generally distributed along the coasts and in the principal seaports, and by the middle of the present century was known as far north as Halifax and Montreal, Canada, and on the Pacific Coast, at San Diego and Humboldt Bay, California. Since the introduction of the brown rat, the black rat has become comparatively rare in most places where the former is abundant. In the Laccadive Islands, in the Indian Ocean, the black rat seems to have modified its habits and become arboreal. It is said to live in the crowns of the cocoanut trees without descending to the ground, and to do great damage by biting off the nuts, upon which it feeds, before they are ripe.

The Roof, or White-Bellied, Rat.—The roof rat, or white-bellied rat (*Mus alexandrinus*), is a native of Egypt, Nubia and northern Africa, and evidently found its way to America by way of Italy and Spain at an early date. It probably reached this continent long before the brown rat, but the exact date of its arrival is uncertain. It is common in Brazil, in some parts of Mexico, and in the southern United States, and is known to occur at least as far north as the Dismal Swamp, in southern Virginia.

The House Mouse.—The well-known house mouse (*Mus musculus*) is readily distinguished from the native white-bellied mice of North America by its nearly uniform brownish color above and below. It is a native of Europe and central Asia, but now occurs all over the world. In the United States it is found from Florida to Maine, and from San Diego to the Pribilof Islands. It is not restricted to the seaports, as it made its way inland at an early date. Sir John Richardson, in 1829, mentions having seen a dead mouse in the storehouse of the Hudson Bay Company, at York Factory, among packages of goods brought over from England, and states that the house mouse was introduced at Engineer Cantonment, on the Missouri River, near Council Bluffs, Iowa, by Long's expedition in 1819-20. By 1855 it was found at many points in the interior, such as Prairie Mer Rouge, La.; Fort Riley, Kan.; Fort Pierre, S. Dak.; Fort Redding, Cal., and Parras, Coahuila, Mexico. It has even penetrated to such points as the Huachuca Mountains in Arizona, where it was introduced about 1891 in a wagon-load of seed grain. It reached Bering Island, one of the Commander group off Kamchatka, in 1870, in a cargo of flour shipped from San Francisco in the schooner Justus. In the southern hemisphere it occurs at Punta Arenas, Patagonia, and is common in such out-of-the-way places as Gough Island, in the middle of the South Atlantic and Kerguelen Island, southeast of the Cape of Good Hope. In short, its distribution is apparently limited only by the arctic and antarctic circles.

Rabbits.

The common rabbit of Europe (*Lepus cuniculus*) was

originally introduced into Australia for purposes of sport, and the results of the experiment are so well known that anything more than a brief reference to them is unnecessary. Suffice it to say that the rabbits were liberated near Melbourne about 1864, and by 1878 had extended westward over Victoria and beyond the Murray River. They were also introduced into Tasmania and New Zealand and spread over the country like a scourge. So rapidly did they multiply that in 1879 legislative action for their destruction was begun in South Australia, and the example was soon followed by New South Wales, New Zealand, Queensland and Tasmania. At the present time their range in Australia is equal in area to that of our three largest States—Texas, California and Montana. Millions of dollars have been spent for bounties, poisons and various other methods of destruction; thousands of miles of rabbit-proof fences have been built, and hundreds of schemes for destroying the animals have been suggested, but nothing has yet been found that will effectually exterminate the pest. Natural enemies, such as cats and other carnivorous animals, have been introduced, and in certain parts of New Zealand, at least, have become almost as much a pest as the rabbits they were intended to kill. In 1887 no less than 19,182,539 rabbits were destroyed in New South Wales alone, but despite the efforts of the Government and private land owners the rabbits seem to be still increasing. In the meantime, a great industry has grown up in the export of rabbit skins. For the last five years New Zealand has been shipping an average of about 15,000,000 per annum, and since 1873 has exported more than 200,000,000. Recently, canning rabbit meat for export to European markets is assuming larger proportions and gives promise of developing into an important industry.

The Mongoose.

The common mongoose of India (*Herpestes mungo* or *H. griseus*, Pl. VIII.) is a well-known destroyer of rats, lizards and snakes, and has been introduced into Jamaica and other tropical islands for the purpose of ridding cane fields of rats. The annual loss which the island of Jamaica formerly suffered on account of the ravages of the introduced black rats (*Mus rattus*) and brown rats (*M. decumanus*), and the so-called "cane-piece rat," including the expense of destroying these pests, was estimated at £100,000, or \$500,000. Various remedies were tried, but apparently with little success, until in February, 1872, Mr. W. Brancroft Espeut introduced nine individuals of the mongoose, four males and five females, from India. These animals increased with remarkable rapidity, and soon spread to all parts of the island, even to the tops of the highest mountains. A decrease in the number of rats was soon noticeable, and in 1882, ten years after the first introduction, the saving to the sugar planters was said to be £45,000, or \$225,000 per annum.

Still the mongoose increased, and its omnivorous habits became more and more apparent as the rats diminished. It destroyed young pigs, kids, lambs, kittens, puppies, the native "coney," or capromys, poultry, game, birds which nested on or near the ground, eggs, snakes, ground lizards, frogs, turtles' eggs and land crabs. It was also known to eat ripe bananas, pineapples, young corn, avocado pears, sweet potatoes, cocoanuts and other fruits. Toward the close of the second decade, the mongoose, originally considered very beneficial, came to be regarded as the greatest pest ever introduced into the island. Poultry and domesticated fowls suffered from its depredations, and the short-tailed capromys (*Capromys brachyurus*), which was formerly numerous, became almost extinct, except in some of the mountainous districts. The ground dove (*Columbigallina passerina*) and the quail dove (*Geotrygon montana*) became rare, and the introduced bobwhite, or quail, was almost exterminated. The peculiar Jamaica petrel (*Aestrelata caribbaea*), which nested in the mountains of the island, likewise became almost exterminated. Snakes, represented by at least five species, all harmless, and lizards, including about twenty species, were greatly diminished in numbers. The same thing was true of the land and fresh-water tortoises and the marine turtle (*Chelone viridis*), which formerly laid its eggs in abundance in the loose sand on the north coast. The destruction of insectivorous birds, snakes and lizards was followed by an increase in several injurious insects, particularly ticks, which became a serious pest, and a Coccid moth, the larvae of which bore into the pimento trees. In 1890 a commission was appointed by the Government to consider whether measures should be taken to reduce the number of the animals, and the evidence collected showed conclusively that the evil results of the introduction of the mongoose far outweighed the benefits rendered to the sugar and coffee plantations.

Recently there has been a change in the situation, and the mongoose is now reported as decreasing, while certain birds and reptiles, particularly the ground lizard, are increasing. Quail and pigeons are reported as more numerous, and there is less complaint concerning the destruction of poultry. Thus, Jamaica seems to have passed the high-water mark of loss occasioned by rats and by the mongoose, and while its fauna has been modified by the presence of the intruders, both native and introduced species are gradually accommodating themselves to the changed conditions, and a new balance of nature is being established.

According to Mr. Espeut,⁷ who originally introduced the mongoose into Jamaica, large numbers of the animals have been sent to Cuba, Puerto Rico, Grenada, Barbados, Santa Cruz and elsewhere, but the fate of these shipments, made at least sixteen years ago, is now unknown. It is now established on Haiti, as shown by the capture of a specimen at Santo Domingo City in the winter of 1895,⁸ and is generally distributed over the island of Puerto Rico. It is also present on the island of Vieques, east of Puerto Rico, and is abundant on St. Thomas. During a recent visit Mr. A. B. Baker found it along the coast of Puerto Rico at Arecibo, San Juan, Fajardo, Arroyo, Ponce and Mayaguez, and in the interior at Utuado and Adjuntas. It was introduced at San Juan about 1877-79, and although now becoming a nuisance, is considered beneficial by the sugar planters, who claim that the rats, which were formerly very destructive to cane,

now do little damage. These rats often live in the tops of the royal and cocoa palms and destroy cocoanuts as well as sugar cane.

The first efforts to introduce the mongoose into the Hawaiian Islands were made about 1881, when a few individuals of a large species were brought from the East Indies and liberated on a sugar plantation in the district of Hamakua, on Hawaii. These animals did not breed and soon disappeared. A few months later a few pairs of a smaller species were imported from Calcutta, but nearly all were accidentally drowned while being landed near Hilo. Soon afterwards seventy-five individuals were imported from Jamaica by the planters of Hilo, and later 215 more were imported for Hamakua. Here the mongoose is aiding in the rapid extermination of some of the native birds, particularly the Hawaiian goose (*Nesochen sandvicensis*), which is found only on those islands above an altitude of 4,000ft., and the Hawaiian duck (*Anas wyvilliana*), also a peculiar species. According to Mr. H. W. Henshaw this duck was common about Hilo four years ago, but in 1898 none were left anywhere in this region. As in Jamaica, the depredations of rats in the cane fields diminished with the increase of the mongoose, but the latter soon became so abundant that measures became necessary to keep it under control. In 1892 a law was passed forbidding the introduction, breeding, or keeping of the mongoose in the islands, and the sum of \$1,000 was appropriated for the payment of bounties on animals killed on the island of Oahu. These rewards, not to exceed 25 cents per head, were to be paid by the Minister of the Interior, but apparently no applications were made for them, the animals being regarded as a necessary evil in the sugar-cane districts.

Attempts at introduction in other countries have not succeeded so well. The mongoose was introduced into the Fiji Islands, probably about 1870, but apparently has not increased to the extent to which it has in Hawaii. Early in the eighties several experiments were made in Australia, which resulted in failure. More than a hundred individuals were liberated near the Murray River and others in New South Wales. An experiment was also made in New Zealand, but apparently without much success.⁹ In February, 1892, it was erroneously reported that the Department of Agriculture was about to introduce the mongoose into the United States for the purpose of destroying gophers in the West. Although founded on a mistake, and speedily corrected, the rumor was so well heralded by the press that it attracted widespread attention. Persons who were familiar with the situation in Jamaica and Hawaii protested vigorously against the supposed experiment. Others, ignorant of the animal's past record and anxious to try some new method of exterminating gophers, prepared to obtain specimens from Honolulu. By the most strenuous efforts these importations were prevented, and as yet the mongoose is not known to have gained a foothold on this continent.

Ferrets, Stoats and Weasels.

In the attempt to check the rabbit pest in New Zealand recourse has been had to the importation of natural enemies, such as ferrets, stoats (*Putorius ermineus*), and weasels (*P. nivalis*). In the Wairarapa district some 600 ferrets, 300 stoats and weasels, and 300 cats had been turned out previous to 1887. Between January, 1887, and June, 1888, contracts were made by the Government for nearly 22,000 ferrets, and several thousand had previously been liberated on Crown and private lands. Large numbers of stoats and weasels have also been liberated during the last fifteen years. This host of predatory animals speedily brought about a decrease in the number of rabbits, but its work was not confined to rabbits, and soon game birds and other species were found to be diminishing. The stoat and the weasel are much more blood-thirsty than the ferret, and the widespread destruction is attributed to them rather than to the latter animal. Now that some of the native birds are threatened with extermination, it has been suggested to set aside an island along the New Zealand coast where the more interesting indigenous species can be kept safe from their enemies and saved from complete extinction.

Flying Foxes or Fruit Rats.

On Aug. 4, 1893, the steamer Monowai, from Australia, arrived at San Francisco, having on board a fruit-eating bat, or flying fox. The animal had taken refuge on the steamer off the coast of Australia, and was captured and kept as a pet by one of the passengers. It was promptly killed by the quarantine officer at San Francisco, and four more, which arrived in captivity two months later from China, on the steamer Rio de Janeiro, met the same fate. Attention was called to the danger of the new pest, and one of the regulations adopted by the State Board of Horticulture in the following year prohibited the importation of these animals into California.

Flying foxes belong to the genus *Pteropus*, one of the best-known groups of fruit-eating bats. The genus includes some fifty species, which are found in the tropics of the Old World, from Madagascar and the Comoro Islands east to Australia, and the Samoan Islands, and north to India, Malay Archipelago, and southern Japan. Five species occur in Australia, two of them as far south as New South Wales (lat. 35 deg. S.), but none are found in New Zealand or in the Hawaiian Islands. The largest species is the Kalong or Malay fruit bat (*Pteropus edulis*), which measures more than 5ft. across the tips of the wings.

In Australia these bats are described as living in immense communities or "camps" in the most inaccessible parts of the dense scrub of gullies and swamps. Here they may be seen by thousands, frequently crowded so thickly on the trees that large branches are broken by their weight. They fly considerable distances in search of food, sallying forth in flocks about sunset and returning to their camps before dawn. In New South Wales, and more especially in Queensland, flying foxes are one of the worst pests of the fruit grower, and are described as a plague which threatens the fruit-growing industry in a large part of Australia. They are particularly injurious to figs, bananas, peaches and other soft fruit, and it is estimated that the damage done to orchards in the coast district of New South Wales amounts to many thousands of pounds annually. Various expedients have been

⁷ Blandford (Mammals of India, 1888-1891, p. 409), who gives Mongolia as its probable original habitat, states that it is not indigenous to India, and is unknown in Persia and Afghanistan, but suggests that it will probably be introduced into the two latter countries as soon as wheeled vehicles take the place of pack animals.

suggested to protect orchards from their depredations. Rags dipped in melted sulphur and hung among the branches, netting placed over the trees and wires suspended around the trees, and even stretched close together from poles and covering the whole orchard have been tried, but apparently without much success. The most practical method is to destroy the bats in their camps. A few years ago the Minister for Mines and Agriculture for New South Wales supplied ammunition for this purpose, and after considerable expenditure of powder and shot about 100,000 foxes were destroyed at a cost of about 30 cents apiece. Wholesale destruction with dynamite was suggested and experiments with high explosives were made by the Department of Agriculture. Charges of roborite (1 to 4 lbs.) and gun cotton (2½ lbs.), connected with wires so that they could be fired by an electric current, were placed in the branches of trees where the bats were accustomed to roost. The bats carefully avoided the trees in which explosives were hung, and when the charges were fired none were killed, even among those roosting in neighboring trees.¹⁰

Since nearly all the species of flying foxes are natives of the tropics, it is hardly likely that they could gain a foothold in the United States, except in the South, but there is a serious danger of their introduction into the Hawaiian Islands by means of vessels plying between Honolulu and the Orient, the South Sea Islands and Australia.

Game Bag and Gun.

In the Rockies.—III.

(Continued from page 406.)

Touchstone: "Ay, now I am in the forest of Arden: the more fool I; when I was at home, I was in a better place; but travelers must be content."—Much Ado about Nothing.

We got an early start the next morning for the first time on that trip. Up the cañons along the steep hill-sides, on game trails worn by the wild kine in their wanderings from range to range, through countless centuries, up and over the mountain passes, and at last our little pack train wound its way out upon a high mountain meadow, park-like with its patches of pine and aspen, and with its carpet of green bunch grass set with glittering gems—blue bells, white immortelles, and the blood-red Indian pinks. Far below, with its sapphire surface half in sun, half in shadow, lay, like molten glass, a lake locked in the mountains. This was our Mecca. I was glad our journey was over, but I fear Dan, in his desire to get away from the beaten haunts, would have pushed on clear through to civilization on the other side had he been left to himself.

For the first time some of the packs divulged their contents, and could our various appliances for making camp life comfortable have been seen by the hunter who prides himself upon his ability to rough it, we would doubtless have been scorned as duds. But it was not my first trip, and I had found out that the more comfortable a man is in camp the better hunting he can do out of it. The better he rests the better he can work. Not the least important part of our outfit was a Racine portable canoe, which Dan and I put together while our men were unpacking and making camp. I got out my fly rod, but Dan, doubtless mindful of his experience with the high-flying trout of the first day, declined to join me.

The silvery surface was spangled over with trout rising to the fly. Upon a rocky promontory stood a brood of young geese gazing curiously at the strange intruders. With much low-toned honking, in many keys, they pushed off upon the smooth surface, where they seemed to feel safer. Rounding a rocky headland, that jutted out into the lake, I came upon a flock of ducks. The young birds sat fearless within 20 ft. of me. But there was one old drake, upon whose head the verdure of many summers found a reflection of glossy green, who was wise in his day and generation. He promptly sprang into the air and labored upward with harsh, grating and insistent quacking, while the youngsters followed with simultaneous splash. It was their first acquaintance with their arch enemy, man.

The lake is simply a cañon which has been dammed up in some long past era by a volcanic upheaval, and is fed by the melting snows on the summits. The water is the clearest and coldest I ever saw, and it is absolutely alive with trout. In places the mountain wall rises a sheer 1,000 ft. from the water's edge, and it is doubtless as deep. Tying together 400 ft. of picket and pack ropes we were unable to fathom it a short distance off shore. It lies at an elevation of 8,000 or 10,000 ft., and so dry is the atmosphere that the cold was simply invigorating; and many a night we sat around the camp-fire in our shirt sleeves while the water froze in the buckets. But at that elevation water boils at such a low temperature that after a week's boiling beans were hardly soft enough to feed to a horse.

I enjoyed rare sport that evening, and rambled along the lake shore until the dusk grew dense and my flies slumbered on the dark water unmolested, when I returned to camp with a plethoric creel and a large, able-bodied appetite.

The lower slopes about the lake were clothed with a dense dark growth of spruce and balsam; higher up the aspens were kindled into flame by the first frosts, and higher still were the open parks, and mountain meadows of bunch grass upon which the declining sun lingered long and lovingly, and which could not fail to be pastured by the wild mountain kine. High above all, above the snow patches, jutted the gray rock peaks, too barren and windswept for the snow to find lodgment.

In the morning we started an hour before day, determined to reach these parks before the sun. The first rays of that luminary is the signal for the game to lie down. By the light of the waning moon we zigzagged upward through the pine-clad steeps, utterly regardless of the noise we were making. More than once while pausing for breath, we heard the thud of hoofs along the mountain side, where some startled deer fled away through the night. All too soon the darkness began to fade, the moonlit patches on the ground began to lose their rigor-

ousness of outline, and objects began to be dimly discernible under the gloomy pines. It was broad day before we reached the park-like terraces, and the game had quit moving. Fresh tracks of deer dotted the ground. Higher up we found the great spreading hoof-marks of the elk. The grass was still rising from where it had been crushed down by the feeding herd, but though we hunted hard we found nothing but tracks, and plenty of them. The game was lying down and our chances of finding it were reduced to the minimum. About noon we gave up the search and descended to camp. After a hearty meal I stretched out in the sun with my pipe in my mouth for a siesta. From beneath my shaded eyelids I saw, with some alarm, that Dan was actually busying himself about something, and in my drowsy condition it at last dawned upon me that he was preparing to leave us. When he stood at last with his blankets rolled up on his back, and his rifle in hand, I managed to arouse myself from the lethargy in which I was steeped, and inquire with difficulty:

"What's er matter?"

"Nothing's the matter," said Dan, "but it is just this way. We came out here for elk. There ain't but one way to get 'em, and that is to go up to 'em and stay all night, and then you can begin with them in the morning while they are moving. As long as this moon is full they run all night and lie down all day. It takes us just half a day to get out of this hole in the ground. Now, I've taken a room on the top floor to-night. Will you go?"

I told him not that night, some other night, and when I awoke about an hour later I went down to the lake and enjoyed the finest fishing I ever had in my life.

When night fell, and Chad, and Toad, and I sat beside the bright camp-fire, I felt sorry for Dan. For in the mountains the evening, and not the midnight, is the witching hour. When night comes up from out the cavernous cañons, when all warmth is blotted out of the Western skies, and the last gleam of color fades, then a deadly cold creeps down from the ice-capped summits, and with the night comes some vague, mysterious presentiment of that longer space of null and dark futurity.

At the same hour, high on the mountain side, almost at timber line, Dan unwrapped his blankets. The sun had sunk behind the Western range; night had already come to the cañons below, and adown the steep and savage slope on which he stood the shadows gloomed. The noisy whiskey-jacks and magpies had vanished. Silent was the dark flow of the stream in the gorge far below, silent and without a scintillation in that thin atmosphere were the stars scarcely more aloof, and silently the spectral vapors peered out from behind the rocks, and drew back again, aghast at sight of a human being in those pre-emptions of solitude. Suddenly the silence was broken by a sound with a trailing refrain of echoes, so far, so faint, so fine, that distant peaks were voiced with fugue-like feignings, mellow, flute-like notes that died away down the echo-making cañon in mellow fragmentary bugling. It was the challenge of the bull elk. The antlered monarch of the mountain had fared forth upon his midnight maraud.

As Dan knocked the ashes from his pipe, and arose from the log on which he was resting, he saw his shadow on the ground, and glancing over his shoulder beheld the full moon with its great disk resting on the mountain's misty rim. It was his left shoulder—good omen—and in answer to the challenge that came again wavering along the windless air, he muttered, "It's your night to howl old boy, but before another moon I'll have your head on a pack saddle."

Better than a century of sleep in beds, sweeter than Sybaritic slumber on couch of crumpled rose leaves, is it to lie out alone on the mountain top, with the world for a bed, and the heavens for a blanket, and sleep the sleep that only comes to the climber in that high, thin atmosphere.

An hour before day Dan awoke, and concentrating all his powers in the sense of hearing, strove to locate the bull who had been so vociferous the preceding evening; but that worthy, evidently recognizing the great general principle that there was a time for all things, remained mute.

With the first streak of daylight, Dan betook himself to the nearest snowfield. As the snow thaws during the day and freezes at night, it is easy to tell when any tracks have been made, and its surface denoted that a large bull had visited it since sunset. The spoor led quartering down the mountain side to timber line, and then in and out among the scattered clumps of pine and aspens, from which Dan judged that it had been but recently laid, and that the animal was returning from his nocturnal rambles to his daily retreat. He seemed to be moving steadily and leisurely in the same general direction. A stern chase is proverbially a long one. Having the direction the bull was traveling, Dan determined to intercept him, and keep above timber line, where the ground was less broken by lateral ravines, and where he could command a larger view. He had abandoned the trail, and cast along the mountain side for nearly a mile, when he heard a noise before and below him, and for the first time sighted the game. It was but a glimpse as he moved through the pines, but it showed a right royal head high above the stunted aspens as the mountain monarch moved leisurely along, recking little of the foe on his trail. Dan threw his rifle forward, and in the excitement of his surprise would have fired had the elk passed, although it was fully 400 yds. For an instant he stood to calm himself, and then ran swiftly along the mountain side for a short space. In the pause he heard a faint sound of snapping twigs. Forward for 100 yds. more, and yet again he spurted and stopped. The belt of pines below him broke about 100 yds. away, leaving an open space into which the elk would emerge if he continued on his way. The moments passed, and Dan stood straining for sight or sound of the quarry. Suddenly, at the upper edge of the copse, and facing him, the big bull strode into view and stopped. For an instant he stood at gaze, his great ears trimmed forward, his full nostrils titillating, and for that instant Dan's heart stood still. But only for an instant; the next he fired, as the bull wheeled, and he went down broadside; but as the lever clicked back in place the huge bulk heaved upward and stood once more erect, the shoulder a fair shot. As the rifle cracked again the elk wilted, and went down, never to rise again.

FRANCIS J. HAGAN.

[TO BE CONTINUED.]

Our Annual Hunt.

THE Colonel for several months had been recounting the many pleasures of our annual fall outings, and we had jointly anticipated what we would do "next October"; also, we had mapped out time after time—whenever we met—the territory we were to cover, the kind of hotel accommodation we might expect, the kind of team we desired, and not last nor least, we made considerable speculation in behalf of our wives, who accompany us to the country on these trips. Of all the previous trips there lives ever fresh in memory fond recollections of the many happy days we have spent together in the fields; and those jolly lunches our good wives served to us from the hamper stowed in our capacious country wagon, which we ever well provided for double the number of our little party with liberal provision for the dogs. What feast more enjoyable? When, with robes spread upon the ground under some shady tree the group assembled, the central figure was the big hamper; the party often numbering seven or eight, sitting or lounging around, and the dogs forming the outer and possibly the most expectant circle. The beauties of landscape, the scenery, the bright autumnal setting sun at eventide as seen by us when rattling over the high hills, and those little snatches of song on our homeward drive, each contributed until the close of day to those truly magnificent pleasures, to be followed with a good substantial supper and a night of rest. It is perfectly safe to conjecture that after a day of outing in October air with plenty of hill climbing and brush beating, we had just the appetite at night for both food and rest.

So the first of October found us on the way. From the stage we alighted in front of the village hotel, in presence of a full assembly of townspeople, for it was "town meeting day." There were present our old-time friends to welcome us; and after much handshaking we were engaged receiving "tips" on game, accompanied with invitations "to call around, and take time to stop at the house," and in most cases something was said about not having any new cider, but "guessed they could provide some of the old stock." Rain kept us in all that day. After a good night of rest we were early awake, anxious to behold the bright shining of a beautiful day; but it being wet again, we concluded to put in but a half-day to start with. At noon the team was brought out and our little party was soon rolling off for the fields, with faithful Dan and the guns stowed carefully away, bent on testing some of the tips of the previous day, and looking over several of our favorite spots where we had often brought to bag a fair number of birds.

This, the first time out, served to get the kinks out of our limbs, or to put more in, and to give Dan a good run, which he much needed. It also settled the point that the birds would be found on the edges of the swales and on high ground, owing to the great amount of water in the swamps, which were full to overflowing. It further proved for the ladies' benefit that a few more frosts were required to open the nuts. The leaves were quite green, and very thick everywhere we went, and of an unusual size, probably owing to a wet season; but a heavy frost at night and a bright day following gave us another full day of real enjoyment, and we brought to bag several birds. But on the following day there came a heavy rain, and for two weeks the time was about equally divided between the fields and indoors. But every day in the field showed that the woodcock were coming in more and more, and that a fair bag could be had with only usual perseverance. The leaves which at first troubled us were daily growing thinner, and the frost had been kind to the ladies in opening the chestnut burrs, coloring the maples, and bleaching the grasses. While our bags of game were not big to boast over, we had birds enough for several game dinners, with broils and stews enough for our own little party, and enough for friends, whom we several times invited to dine with us.

Woodcock we could get every day along the alder swales, and several partridges fell before our guns, with an occasional gray squirrel and a few quail. Rabbits, which on former hunts had troubled the dogs much, were entirely absent, not one being seen during two weeks. Quail were very scarce; we raised only three bevy, and of these only one seemed at all like those of former years either in point of numbers or size of birds.

One bevy we heard of, and had been invited to hunt, we found after a long and careful search, and only made four or five shots at them, as they were undersized. Another bevy the ladies passed on the road while out driving, which they located, and reported to be the "real old stock." After a good lunch we commenced the hunt for them, and after going over many acres of cover, some of which was a veritable jungle, we found them. They were fully grown Connecticut quail, and when they rose the Colonel brought down one with each barrel, while I scored a clean miss, being in a bad position to shoot, but able to mark down eight or nine as they dove into a thicket of briars and brush of acres in extent. The Colonel viewed the fallen with much pride, pronouncing them real old-timers, genuine beauties, while we hastened to those marked down. From these we succeeded in getting five singles, one of which we failed to find.

Another bevy of a full dozen I ran into while crossing a stubble to join the Colonel, who was running Dan over a bush pasture. As they went up I had shot one before discovering that they were too small to count, not being much larger than robins. After marking them down and regretting that they were not up to my standard of size, I turned my back on the last bevy of the hunt and joined the Colonel, whom I acquainted with the exact condition of affairs, and who acquiesced in the opinion that another season would be a profit both to the birds and ourselves, should fortune permit our meeting on that occasion.

Upon reaching the hotel and while talking over this day's hunt, a very responsible native of the village gave us a true statement "that he caught with his hands a full-grown partridge in his horse stable that afternoon while feeding his horse." The stable adjoins his house in the center of the village.

The last day remaining we proposed to make a grand "round up"; accordingly, the landlord, with two mutual friends, and a first-class Gordon setter—Glen—were to be of the party; and all were on hand early in the morn-

ing, and the party started for the fields, but all in strong doubt as to the weather, the sky frowning threateningly upon us when we made our first venture into the cover. The landlord, thinking his chance among so many guns but a slim one, concluded to stroll on ahead to some woods on our course, in hope that he might pick up a stray gray squirrel; as his claim for marksmanship on the wing he positively declared to be but second to his efforts at a "squirrel perched on a limb anywhere within 35yds.

The party had picked up some five or six woodcock, and were nearing the landlord's field, when the sound of his gun was heard to ring out but a little ahead; and the verdict of the party was unanimous that he had found his squirrel. In a short time we came upon him busy in the brush doing both the work of dog and hunter, with a partridge sticking out of his pocket, which was pronounced the largest ever seen by any one of the party. "Then, this is your trick!" says the Colonel. "You had an engagement with that bird," says another. But upon assurance that it had been entirely an accident, and he believed he had shot with both eyes shut, we willingly pardoned him and commenced a search for the other bird, which he assured us had risen at the same time. After spending much time going over all the grounds for acres around, we left for the road some eighth of a mile ahead, where, by appointment, we were to be met by the wagons for lunch. It was punctually on hand; lunch was served, the wagons were dispatched ahead to join us some three miles from there. Accordingly, we took to the woods and were profitably improving the afternoon when the rain began to come down, and we had to seek shelter under the trees. As soon as it let up a little we set out on our homeward tramp, occasionally diverging to an alder swale, and bagging a woodcock. We joined the ladies, who had been nicely sheltered in a farmhouse, and our outing was over. Nothing now remained but to pack up, go home, and live over its pleasures.

SID BROMLEY.

Among the Grays.

"DAY before yesterday went to Bee Hollow; killed nine. Yesterday went out on Buck Run; killed fourteen. All on the hickories. Good time to come now. Yours truly, —George H."

That is the way the card read, and it told the whole story. Monday morning early I caught the train, and at 9 o'clock was talking it all over with George. After a chat with all the family we went early to bed, for Bee Hollow was three miles away, and the gray squirrel is an early riser. After a nap of what I thought about three minutes, I heard a voice say, "I thought you were going with me this morning." Soon we were off. Swiftly we walk half an hour, when we stop at the foot of Locust Knob, a famous place for squirrels and the highest point anywhere around. George, a prince of good fellows, tells me, "Go up to the top of this knob and follow the ridge around. I will go up this other side and meet you at the head of the hollow." I obey and slowly start up the steep hillside. It is a long, hard, climb and I am about out of breath when I gain the top and sink down on a nearby log to rest and see what I can see. The early birds are just beginning to wake up; day is rapidly breaking; not a breath of air is stirring and silence is the order, save for the song of birds. Sitting there I watch the east grow red and light up with the rising sun. Suddenly the stillness is broken by the roar of George's Remington with 3½drs. of good old black powder. How it startled me and what a noise it did make in the oppressive stillness. I hear a slight sound off to my left and quickly turn, to see a gray seated on a limb about 25yds away, a nut in his mouth. He has been watching me all this time and is now ready to vanish at the least move. Slowly I raise the gun; it comes into line, there is a spiteful crack of the nitro and down he drops. Quickly I go to him and admire his sleek coat. I am sure I am even, unless George killed two at his shot, which is not likely. I sit on a root and watch when a sunbeam shoots by and lights up the whole knob and I see the shadows fall down the steep hillsides. O, what a picture nature paints for us out in the wood in the early morning, and in fact at all times of the day, if we are only there to see and enjoy them.

I am about to forget I am out squirrel hunting, when the rustle of a bough causes me to look quickly around and I spy one coming my way. He comes fast; now he is near enough and I put him in the pocket for company with the other one. George has fired three times and I feel that I am one behind; but I fail to get sight of any more, so start slowly along the ridge. Looking about 100yds. ahead, I see the top of a tree shaking, and know at once that I have a piece of stalking on hand. As easily as possible I go for 25yds. Here is a strip of corn. I step into it and on the plowed ground make no noise at all and easily get within 25yds. of the tree, when I see that it is a small hickory and that there are four squirrels on it, one near the base, one about half way up, the other two in the very top; and all cutting as hard as they can. I plan out how to get all of them. I watched them a moment, but the report of George's gun reminds me that I am surely behind. I take the one on the base and drop him dead; the one about half way up starts down, but my aim is good, and down he falls nearly on top of the other one. As quickly as I can I open the gun, slip in fresh shells and am just in time to catch the third one on the end of a limb ready to jump, and catch the fourth one in the air as he leaps out far down the hill. I get all four of them now quicker than I write this, and I hugged myself with joy at the neatness and dispatch with which the work was done. Then I sit down and enjoy the beautiful morning. I have six; that is enough. It is not all of hunting to kill; but we must be at least partially successful to enjoy anything. So far I am out six shots and have got six squirrels—a good deal better ratio than I am used to. Finally I take the path to the place of meeting. Going slowly and silently along I see one, and it takes two shots to put him with the others. I see another one on the root of a large tree, fire at it and never see hair nor hide of it again—a sudden and mysterious disappearance.

The hour is getting late; they have quit cutting. I hear George's "Whoo-e-e," and go to meet him. He has fired nine times, so I feel that he is ahead; but he did not have his shooting cap on to-day, for he only had four to show.

Taking it leisurely along, we get home at 10 o'clock. I am extremely well satisfied with my hunt. On stepping into the yard a good, motherly woman hands me a glass of buttermilk, and behind her stands a lovely young woman who asks, "How many did you get?" George lays out on the grass his four; I lay out alongside of them my seven, whereupon that maiden says, "O, I am so glad!" a blush mantling cheek and brow. "You got enough to make a good squirrel pie," and turning fled into the house to hide that blushing face. Afterwards she confided to me that she had started to say, "I am so glad you beat pa." I was glad, for I learned a thing that I was not so fully posted on as I wished to be.

I was so well acquainted with George that I did not boast of my success, a compliment he returned the next day, when he beat me two to one.

Ten years have gone since this day's hunt was enjoyed, yet the memories of that week, its successful squirrel shooting, the delicious watermelons we ate, the companionship of congenial spirits, all go to make it a red-letter week in my life.

OMO.

Game, Forests and Indians.

TORONTO, May 23.—*Editor Forest and Stream:* When near the close of the present century, it may not be out of place to take a retrospective view of what has been accomplished in game extermination in the United States and Canada during the last half of it. It may also be in order to allude to the unwise methods indulged in that have produced such undesirable results. Within the recollection of many of the readers of *FOREST AND STREAM* game and fish were abundant all over North America. The woods were full of ruffed grouse, the prairies teemed with untold numbers of prairie fowl, the cultivated lands with quail, the swamps with woodcock and snipe; in many parts of the country wild turkeys were found in abundance, our lakes and marshes contained millions of ducks and other waterfowl.

Referring to the game animals of the woods and prairies, we have an object lesson of what the greed and selfishness of men can accomplish in the extermination of the buffalo. This increasing greed and selfishness is having similar effects on the game and fur-bearing animals still remaining. This is also applicable to the fish with which nature has so abundantly supplied our beautiful lakes and rivers. Nature never intended this grand heritage of the woods and waters bequeathed to her children to be abused or even used for the exclusive benefit of combinations. Capital has its uses, but it should not be used for the purpose of enriching a few, resulting as in the case of the buffalo in the practical extinction of both game and fish. Recent events in which wise restrictive provisions have been repealed should not pass unnoticed by the genuine sportsmen, rich or poor, who delight in the pleasure derived from an outing in the woods and not from the amount of fish or game killed. They have the remedy in their own hands. County and State clubs should be formed and committees appointed for the purpose of watching legislation and checkmating the foul work of lobbyists in the interest of combines.

It is difficult to realize that there are men so short-sighted as to oppose forest reservations and subsequent reforestry. It is reasonable to suppose that with the immense increase in population and an increasing foreign demand for the products of American and Canadian forests, that fifty years hence a stick of timber will be almost as great a curiosity as a buffalo is at present. Forest reservation on a large scale and reforestry are the only remedy. The governments should set apart for reserves and reforestry large portions of the public domain from which the timber has been taken. Large tracts of these lands have already a vigorous growth of young trees on them and nature should receive all possible assistance in her efforts to assert her rights in the interest of her extensive family. The value of forests independent of money realized from the sale of timber is too well known to require further reference thereto. The Government of Ontario, at the request of the Honorable Commissioner of Crown Lands, has recently set apart a large portion of the eastern part of the Province for reforestry. I am informed that large tracts are to be set apart for this purpose from year to year. This wise policy will not only have the effect of preventing the rivers and streams from becoming mere rivulets, but will also provide food and cover for our valuable game and fur-bearing animals.

A radical change is required in the management of Indian affairs, both in the United States and Canada. If one-half the money had been spent in teaching the Indians how to farm and become independent and self-sustaining instead of herding them on reserves and making paupers of them, it would have been in the interests of all concerned. A late distinguished Canadian statesman is credited with saying that the only good Indian is a dead one. I am not prepared to accept that statement. The Indians of the present are to a large extent what we have made them, by taking every possible mean and dishonest advantage of them; nothing has ever been done to obtain their confidence and respect by dealing honestly with them. On the contrary, traders and companies have taken every opportunity of robbing them, resulting in demoralizing them to a disastrous extent.

Early writers state that previous to the Indians' contact with the whites they were moral, honest and truthful. As evidence of this we have only to refer to the works of many of those truly great and good men, the pioneer missionaries. The Indians as well as the game have been forced back from time to time by what we have been pleased to term the advancing tide of civilization. This process has in a large measure compelled the Indians to kill game and fur-bearing animals at all seasons to enable them to eke out a miserable existence. If this system is continued, it is only a question of a few years when the Indians and the game they depend on cannot be forced further back and both will forever disappear from the North American continent. Can such an undesirable result be prevented? I am sanguine enough to believe it can. It has been truly said that Great Britain is far more indebted to her honest and upright civil officials for her Eastern possessions than to the army or navy.

Indians are not all as represented to be. Many are intelligent, and some educated. These should be instructed by the powers that be to confer with their respective tribes and endeavor to convince their less favored brethren how

unwisely they are acting in the useless and often unnecessary slaughter of large game and fur-bearing animals. The Government should also have the Indians removed from the unproductive reserves and given the same facilities for making a living on productive lands awarded to natives inferior to them in many respects from other countries. This, with a systematic policy of forest reservation and reforestry will effectually prevent game extermination in North America, is the opinion of

RANGER.

Uncle Jimmy's Last Bear.

UNCLE JIMMY MOORE was one of the pioneers of Ohio, settling at Waynesville in 1802. He was my grand-mother's youngest brother, and came to see us every year. He was ninety years old when I first knew him; a man of square shoulders, well-built frame and massive head, covered with snow-white hair. The face was old and wrinkled, and the cheeks and lips sunk in about the toothless jaws, and a chronic disease of the eyes compelled the wearing of goggles. He wore the typical old-time Quaker hat, wide of brim and high of crown, gray in color and made of beaver fur. He was not well versed in the ways of urban society, but was one of nature's warm-hearted children, whose affections overflowed toward everyone around him. Once a year, in the month of August, he drove ninety miles to see our old grandmother, who was his only sister, and her children. To us, the grandchildren, he was a curiosity, a living being from that mysterious time when Indians and "painters" and bears possessed the land. Like all very old people his memory was full of reminiscences which a little invitation would induce him to relate, and many were the life stories he told while we children hung around him, full of breathless interest.

One pleasant August evening we were sitting on the porch, Uncle Jimmy with us. He sat with his chin resting on his big rough hands, which were crossed over the heavy buckhorn-handled cane that he always carried. He was saying nothing; I wondered what he was thinking about. I know now, that his mind was roaming among the years of his strong manhood when the days were not half long enough, and fatigue a thing he could not comprehend. The days when the deer came to eat his young wheat, and the bears tore down his corn when it was in "roastin'" ear, and the turkeys could be seen catching grasshoppers in the clearing.

Presently father said, "Uncle Jimmy, does thee remember the last bear thee killed?"

Raising his bowed head and looking out across the fields a moment, he said, "Yes, I remember it mighty well. It must 'a' been nigh fifty years ago. The country had got purty well settled up, and we had some neighbors within three miles of us. It was in the spring, and I'd got the corn planted, an' me an' S'lina had been a-visitin' to the neighbor's house, an' was comin' home 'bout an hour by sun. We had a little dog, a young feller, with us, and he was runnin' round in the woods, huntin'. Bime by he set up a great barkin' an' yelpin', an' seemed to be chasin' somethin'. Whatever it was, he was chasin' it towards us, an' I got up on a log to see what it was. Just then I seed it was a bear, an' the bear seen I was a man, and turned off with the dog still chasin' him an' snappin' at his heels, an' then the bear would stop an' turn round and strike at the dog, but the dog would be out of reach, so the bear couldn't hit him. I knowed the bear would tree 'fore long, if the dog kept pesterin' of him, an' there was no man in sight. We was purty nigh home, so I told S'lina to run to the cabin an' bring me the gun, while I staid and listened so the dog wouldn't get out of hearin' of me.

"By the time she got back, I knowed by the way the dog was barkin' that the bear had treed, an' I kalkilated by the sound that he must be purty nigh a mile away. It was then gittin' purty near sundown, an' I started on a run, an' was purty well blowed by the time I got to where the dog was barkin'. I knowed if the bear see me, he'd come right down an' run off, an' I'd get no shot, so I got down an' crawled through the brush till I got a glimpse of him in the fork of a white oak, over 200yds. away. They was a big poplar, 'bout 80yds. from the tree the bear was in, an' the poplar was purty nigh right between me an' the bear, so I got the poplar between me an' the bear, an' slipped up to it mighty easy; but I reckon I must a made a little noise, or mebbe the bear thought I was follerin' of him, 'cause when I peeped round the poplar he was lookin' right at me, and begun to back down the tree. I kip the gun p'inted at him as near as I could, hopin' he would stop long enough for me to shoot, but he didn't stop till he got about 12ft. from the ground. Then he stopped and looked down to see where he would land, an' I knowed in a second he would let go all holts an' hit the ground a-runnin', so I took a quick aim behind his shoulder an' pulled the trigger, but jist as I pulled, I seed him let go, an' he was fallin' before the old flint lock went off. The bullet just cut a big gash in the back of his neck, an' soon as he hit the ground he started right et me.

"I didn't have a knife, an' I knowed if I didn't get the gun loaded 'fore he got there, he would kill me, so I jerked the stopper out of the powder horn an' poured powder in the gun with one hand, and got a patchin' an' bullet out of the pouch with the other. I don't know how much powder I put in, but I noticed when I pushed the bullet down, that the ramrod stuck out 'bout 6in. further 'n common. All this time the bear was comin' for me, but the little dog was snappin' at his heels, an' the bear turned round at the dog three or four times, but he was within roft. of me when I got the bullet down, an' I had the primin' to put in yit. I seed I wasn't goin' to git the gun primed, so I drewed it back to club the bear, but jist then the little dog grabbed his heel an' held on. I reckon he must 'a' pinched his heel purty sharp, for the bear squalled, an' turnin' round on the dog, he picked him up with his forepaws an' stood on his hind feet, huggin' the dog so tight he didn't give but one yelp, an' it a mighty short one. Then I slapped some primin' in the pan, and pushed the muzzle of the gun hard against the bear, behind the shoulder an' pulled the trigger. The bear fell over an' let go of the dog. The little feller seemed to be dead, but bimeby he got his breath that the bear had squeezed out of him, an' didn't seem much the worse of

it. When I cleaned the bear, I found the bullet patchin' in his heart. There was seven small bullets in one of his shoulders. They were right against the shoulder blade, an' they must 'a' been there a good while, for there was a tough gristle grown around each one. I reckon some Indian must 'a' shot 'em there, for they used to have smooth-bore guns, an' load 'em with several small bullets, but the white men all used rifles."

O. H. HAMPTON.

INDIANA.

Iowa State Association.

ALGONA, Iowa, May 25.—*Editor Forest and Stream:* The twenty-second annual meeting of the Iowa State Association for the Protection of Fish and Game, was held here this week, President J. G. Smith in the chair. In his address to the delegates, Mr. Smith said:

President's Address.

Gentlemen of the State Association: At the twenty-second annual meeting of the State Association, now being held at Algona, in behalf of our citizens I extend to you a hearty welcome, and am glad to know that so much interest is taken in our work. In my remarks to the Association last October, at our meeting in the city of Des Moines, I called up the matter of the dam in the river at Bonaparte, Iowa, and I hope the Association will at the present meeting take some steps to present the matter of the removal of the dam to the next General Assembly. Every lover of fish and game in the State knows that that obstruction should be removed from the river, so that the fish could pass up and supply the streams of the Des Moines Valley, with all the fish needed. I hope every lover of fish and game will take pains to go to the polls next November and vote for men that will do justice to the people of the Des Moines Valley. We have the power, gentlemen, let us use it. Ten to twenty thousand votes will count, and many a man will be left at home who is not willing to attend to the wants of the people of the State; good men can be found in every legislative district. Make it your business to see that they are elected; see that those one-horse statesmen, who think there is nothing to do in the next General Assembly but to vote for a United States Senator, are left at home. We want business men in our Legislature, men who will look after the interest of our State.

Our Fish Commission should be placed on an equal footing with the Fish Commissions of other States. As it is at the present time, it practically amounts to nothing. Our lakes and streams are not stocked with fish, and the Iowa State Fish Hatchery is a disgrace to the State. The fish hatchery should be located in some place where the ponds can be kept open in the winter season; some place where there is some shelter from the cold north winds, and where plenty of running water can be had at all times. A State fish hatchery should not be a plaything to look at, it should be a place to breed fish to stock the lakes and streams of the State.

Iowa should have fifty times as many fish as she has at the present time.

A law should be passed in the State to protect the Chinese, the Mongolian and the English pheasant for the next five years. There is no reason why our State should not be well stocked with fine game; other States have met with great success in this work, and there is no reason why Iowa should be behind in the work.

The last national House of Representatives passed Mr. Lacey's bill in regard to stocking the States with different kinds of game birds, but selfishness in the Senate killed the bill, and one of the best bills was lost that was ever presented to Congress. Selfishness did the work. Many members of the United States Senate could be well spared, and it would be a great benefit to the nation if they were left at home. They seem to think that the United States Senate was created for them. They forget that they are servants of the people.

Our game and fish laws are good and fairly well enforced, and I think there is a general disposition in the State to comply with the laws. It is our duty to future generations to see that the fish and game are protected. Thirty years ago Iowa was well stocked with fish and game. Let it not be said that one generation destroyed it all.

Many of our sister States have passed laws to enforce a "license tax" upon citizens of other States, who shoot and fish within their borders. I hope the State of Iowa will never have any such law in her code. I believe that kind of a law would be unconstitutional. As the Constitution of the United States guarantees equal rights to all the people of the United States, such laws breed up a class of "pot-hunters," and are disgusting to sportsmen who enjoy being out with the rod and gun. When it comes to the point that my brother sportsmen, who live just around an imaginary line, cannot shoot a day with me without paying \$25, I want to quit shooting in the State.

More attention is being paid to the taking care of our forests than ever before. The people of the United States begin to realize that their timber will not last forever. Minnesota has taken steps to have some 2,500 square miles set apart for a sort of national park. The land they propose to set apart is one of the grandest game countries in the world. There are a large number of splendid lakes, full of fine fish, and one of the greatest breeding grounds for water fowl in the United States. Let us hope that Congress will not be backward in doing its part of the work. If we want to make a barren, desolate country of our fair land, we cannot do so any faster than to destroy our timber and kill all our game and fish.

The State of New York is alive to the fact that something must be done to preserve their timber, and if they do not many of their farm lands will soon have no value. Too much timber cannot be planted, and it is a duty we owe to future generations to increase rather than diminish our forests.

I hope the people of Iowa will soon be alive to the fact that our small birds are fast being destroyed and work together to prevent the destruction of our song and plumage birds. Thousands of them are destroyed every year, and unless something is done the song and plumage birds will soon be a thing of the past; many of our best men and women allow their boys to go into the woods

and kill the beautiful song birds, just for the sake of killing something. The poor innocent birds are left on the ground, maimed and wounded, to suffer and die. The red birds of the South will soon be heard no more. The wings of the beautiful heron and the "silver wing gull" will only be found on ladies' hats or in some millinery store. There has been a great awakening in the matter in many of our Eastern States. Ladies can always find flowers to adorn their hats and thus save our song and plumed birds. We have good laws for the protection of our birds, and I hope every member of our Association will do his part toward enforcing them.

It was voted that the next annual meeting of this Association be held in Marshalltown, Iowa.

On motion of Mr. Budd, Mr. Kibbey, of Marshalltown, was elected President of the Association for the ensuing year. Mr. Kibbey, on taking the chair, said: Gentlemen: I thank you very heartily for the honor you have conferred on me. I have been a member of this Association for the past eighteen years. I have not been able to meet with you very often, but I have taken a great interest in it, and have been heartily in sympathy with all its acts. I hope I will be able to fill the position creditably and be of benefit to the Association. I think we will be able to gather a good number of shots at our next meeting, and have every reason to believe it will be a success.

On motion of Mr. Abbott, Mr. Gilbert, of Spirit Lake, Iowa, was elected Vice-President.

On motion, Mr. Abbott, of Marshalltown, Iowa, was elected Secretary for the ensuing year.

On motion, Mr. Densel, of Marshalltown, was elected Treasurer for the ensuing year.

On motion, the following named members were elected to constitute the Board of Directors for the ensuing year: A. H. Sheldon, Mason City; Joseph Kirscher, Des Moines; F. R. Patch, Hartley; Chas. W. Budd, Des Moines, and Chas. Grim, Clear Lake.

Dr. Paul—Mr. President, I would like to ask Mr. Smith if he has any plan whereby the ideas set forth in his address might be carried out?

Mr. Smith—I have no plan outlined, but under the present law of the State of Iowa it makes our Fish Commissioner a Game Commissioner, with power to appoint wardens in every county in the State. I think he rather claims that the appropriations are too small to do much work. I have been before the Legislature several times trying to get this appropriation increased, and it seems to me it should be. Unless a fishway is well put in and looked after, it is of no benefit. It is called a fishway, but no fish will ever go over it. There has got to be a great deal of expense to get it in shape. I have already called the Commissioner's attention to the recent decisions, and said we expected to see that he did something of the kind, but it has heretofore been almost entirely left with the local clubs to do anything with the matter of fish and game. In our matter of Fish Commissioner we have never had a man in the office who cared a great deal about it. He has filled the office and drawn his pay, and that is all it amounted to in the State of Iowa. Minnesota has been very successful, also Wisconsin, Illinois and Michigan. I think there is no State that does not pay more attention to fish and game than the State of Iowa, and it seems to me that if the members of the different clubs would take a little pains to see the nominees in this State, that the Legislature would give more attention to it.

It was voted that the Secretary we instructed to send the Fish Commissioner an invitation to be present at the next annual meeting, and, if thought best, to send transportation with the invitation. Moved and carried that the Association extend a vote of thanks to Mr. Smith, the outgoing President, for his efficient service during the past year, and also to the citizens of Algona, who, by their presence and kindly feeling have contributed greatly to the pleasure of the occasion.

Notes from Gettysburg,

GETTYSBURG, Pa., May 2.—*Editor Forest and Stream:* A well-known physician of Philadelphia, who spent last summer at a hotel in the mountains near here, became so much interested in snakes that he has decided to make a study of the habits of the rattler and copperhead. He has written a letter to a friend here, stating that he will pay \$1.50 each for good, healthy, live snakes of these species. Furthermore, the doctor says he is willing to buy a large number at that price, and offers an extra inducement of \$1 per foot for all snakes over 3ft. in length.

Upland plover seem very plentiful this spring, which is a rare thing for Adams county. They can be seen in pairs in all parts of the county. Very few are shot here, which accounts for the increased numbers.

Charles Fate, a local sportsman, has quite a menagerie. It consists of the following animals and birds: Four Shetland ponies, three great Dane dogs, one monkey, twenty guinea pigs, three red foxes, one bay or red lynx, one raccoon, nine German hares, two gray squirrels, one alligator, three crows, one ringnecked dove and two parrots.

Partridges escaped the severe winter better than was expected, and will be right plenty in some parts of the county.

Three wildcats were caught in traps during the month of February on what is known as the "Green Ridge," a spur of the South Mountains. They are of the bay or red lynx variety, which extends nearly over the United States.

An alligator about 4ft. long was caught in Bermudian Creek last week. It is supposed to have been put in the stream by some of the soldiers from Adams county who were in Florida during the war with Spain, and who have returned lately to their homes. F. M. B.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Pennsylvania Game and Fish Constables.

HARRISBURG, Pa., May 24.—*Editor Forest and Stream:* A meeting of the Pennsylvania State Game Commission was held at their rooms in this city to-day, and was one of the most interesting meetings held by that body since its organization. Considerable effort was put forth by these gentlemen, to have the last Legislature perfect certain existing laws, and add new ones for the protection of game in Pennsylvania. The commission as individuals feel very much elated over the success of their efforts, especially in securing the passage of the act making a constable of the State a game, fish and forestry warden of the State, and imposing a penalty of \$50 or two months' imprisonment upon that official when he neglects or refuses to perform his duty; this act gives the help of a small army in enforcing the laws relative to their different interests, and must result in much good to game and fish protection in Pennsylvania.

When the attention of a constable is called to the violation of the game or fish laws, by the commission or an individual, he is placed in the peculiar position of reporting the case to the district attorney for prosecution, or paying the penalty. And the commission feel satisfied that when the citizens at large are acquainted with the conditions of this law, and know that the constable in their district must take notice of their protests or pay for his neglect, there will be a change in present existing conditions.

A resolution was adopted requiring the secretary to place a copy of this law in the hands of every constable in the State, with notice that the commission propose to see that its provisions are complied with; the commission desire it distinctly understood that they will at once proceed against any constable who refuses or neglects to enforce any of the laws pertaining to these commissions, more especially the game laws. And the fact that the commission has the united support of the State Sportsmen's Association, would seem to make the violations of these laws extremely dangerous.

All correspondence addressed to the Game Commission at Harrisburg, Pa., will receive prompt attention.

A general vote of thanks was given the Hon. Frank G. Harris, of Clearfield, for his interests and efforts in behalf of game protection during the session of the last Legislature, and a resolution relative to national and international game protection was adopted as follows:

"In view of the fact, that the provisions of our present laws, in the United States and Canada, permit the spring shooting of all aquatic fowl, and that song and insectivorous birds, justly protected by law in this, and many other States, are treated as game birds in some other States, thereby rapidly depleting their numbers; therefore be it resolved that the Game Commission of the State of Pennsylvania, in session at Harrisburg, Pa., on May 24, 1899, do condemn the spring shooting of all aquatic fowl, and the robbing of their nests within the United States and Canada, also the listing of certain song and insectivorous birds, which are justly protected by law in this and many other States, as game birds in certain other States in the Union. We invite the prompt and concerted support of all game commissions, associations and individuals, in the United States and Canada, to aid us in securing prompt national and Dominion laws, which will totally abolish this nefarious and inhuman practice.

"Be it further resolved that the secretary be directed to transcribe this resolution upon the minutes of the commission, and to give it as wide a publication as possible."

The next regular meeting of the commission will be held in Harrisburg, Pa., the first Thursday in July.

DR. JOSEPH KALBFUS,
Secretary Pennsylvania State Game Commission.

By special request of Dr. Kalbfus we give the full text of the law:

AN ACT.

Making constables of townships and boroughs ex-officio fire, game and fish wardens, prescribing their power and duties, fixing their fees as wardens, and prescribing their punishment for failure to perform their duties.

Section 1. Be it enacted, etc., That from and after the passage of the act the constables of the various wards, boroughs and townships of the Commonwealth shall be ex-officio fire, game and fish wardens.

Section 2. It shall be the duty of said fire, game and fish wardens to enforce all statutes of this State now in force, or that may hereafter be enacted, for the protection of forests and timber lands from fire, and for the protection and propagation of game, game birds, game mammals, song and insectivorous birds, and fish, and said constables or wardens shall have authority to arrest without warrant any person or persons caught by them in the act of violating any of the aforesaid laws for the protection of forests and timber lands, game, and food and game fish, and take such person or persons forthwith before a justice of the peace or other magistrate having jurisdiction, who shall proceed without delay to hear, try and determine the matter. Such arrests may be also made on Sunday, in which case the person or persons arrested shall be taken before the proper officer, and proceeded against as soon as may be on a week day following the arrest.

Section 3. Said constables or wardens shall have power without warrant to search and examine any boat, conveyance, vehicle, fish box, fish basket, game bag or game coat, or other receptacle for game or fish, when they have good reason to believe that any of the laws for the protection of forests and timber lands, game and fish, have been violated; and the said constables shall at any time seize and take possession of any and all birds, animals or fish, which have been caught, taken or killed at any time, in a manner or for a purpose, or had in possession or under control, have been shipped or are about to be shipped, contrary to any of the laws of this State. Any court having jurisdiction of the offense, upon receiving proof of probable cause for believing in the concealment of any bird, animal or fish, caught, taken, killed, had in possession, under control or shipped, or about to be shipped, contrary to law, shall issue a search warrant and cause a search to be made in any place, and to that end may, after demand and refusal, cause any building, enclosure or car to be entered, and any apartment, chest, box, locker, crate, basket or package, to be broken open and the con-

tents thereof examined by said constable. All birds, animals, or fish, or nets, or fishing appliance, or apparatus, seized by any constable or warden, shall be disposed of in such manner as may be directed by the court before whom the offense is tried, and such constable or warden shall not be liable for damages on account of any such search, examination or seizure, or the destruction of any nets or fishing apparatus of any kind in accordance with the provisions of this act.

Section 4. Any constable or warden, upon the arrest and prosecution of any offender to conviction under the provisions of this act, shall, in addition to the fees to which he may be entitled under existing laws, be paid for his services the sum of ten dollars on a warrant drawn by the county commissioners on the county treasurer, one-half of which shall be paid out of the treasury of the respective county, and the remaining half of said reward shall be paid by the State Treasurer into the treasury of said county, out of moneys not otherwise appropriated, upon warrant from the Auditor-General, but no such warrant shall be drawn until the respective county commissioners shall have first furnished, under oath, to the Auditor-General, a written itemized statement of such expense, and until the same is approved by the Auditor-General: Provided, That no county shall be liable to pay for this purpose in any one year an amount exceeding five hundred dollars.

Section 5. Each of said constables or wardens shall, for the purpose of this act, have concurrent jurisdiction throughout his own proper county; and they shall in the first week in each term of the court of quarter sessions of their respective counties make special returns to said court, under oath, of all violations occurring in their respective townships, or which may come or be brought to their notice, of any of the provisions of any law now in force, or that may hereafter be enacted, for the protection of forests and timber lands, game and fish; and it shall be the duty of the judge of said court to see that such returns are faithfully made, and any constable or warden wilfully neglecting or refusing to make such returns, or to prosecute any offense under said laws of which he shall have personal knowledge, or of which he shall have notice in writing by any citizen, giving the name of the offender together with the names of the witnesses, shall be guilty of a misdemeanor, and upon conviction thereof be sentenced to pay a fine of fifty dollars, or to undergo an imprisonment in the county jail of two months, both or either, at the discretion of the court.

Section 6. All sections, provisos, acts or parts of acts inconsistent with this act, or any section of it, are hereby repealed.

Approved—The 22d day of March, A. D. 1899.

Some Gun Notions.

SOME gun barrels oxidize much more readily than others, even when the price of the barrels indicates the same grade of workmanship. I have a pair of barrels which cost £50 in England. The left barrel with the same care has spotted far more than the right, and both much more than the other pair, which have been shot ten times more frequently. My past experience has taught me that thorough cleaning, wrapping up closely and laying away was the best protection I could give.

For small game such as grouse, plover and even ducks when shot over decoys or flushed in creeks, a gun not larger than 14 is the proper size; and in my opinion the day is not far distant when the small bores will displace the heavier and larger guns. A man of ordinary physical vigor is unable without great personal discomfort to tramp all day with even 8lbs. of gun to carry in addition to his shells, his lunch and his game. A 14 or 16-bore weighing from 6 to 6½lbs. is a far more agreeable burden. These guns are effective if handled properly, and really afford more genuine sport because success with them indicates a higher degree of skill. The best shot within my knowledge uses a 16-bore, and slightly closed choke at that. I prefer a cylinder gun, and the best record I ever made was with a 14-bore cylinder weighing 6lbs.

Some people suggest that the American demand for crooked stocks is wrong. I do not agree with them. Much, of course, depends on habit. But I have tried all drops from 2½ to 3½ at the butt, and at last have found that 3¼ at the butt and 2 at the comb fit me much better than any other crook. There is also a contention for long stocks. In this respect I again differ. I know I can handle a gun with 13⅞ drop far better than I can one with 14¼. It must be recollected that except at the trap and in warm weather the sportsman wears thick clothes, and a large number of persons would find that if their guns were so long as 14¼ they would often find trouble in making it clear the arm. I have tried it and I know whereof I speak. In the winter few men need a longer stock than 14in., who could easily in the summer or early fall handle one 14½in. The advantage of a short stock is that when the necessity comes a pad can be put on the butt of the gun to make it fit the arms of the shooter.

Let no man who believes in the use of much iron in a gun barrel upbraid me for my preference for light and small bore guns. For certain game a heavy gun is very desirable, but for snipe, woodcock and Bob White 6½lbs. weight is far better. To my mind the use of a 10-bore on birds is as ridiculous as Wolcot described the style of Dr. Johnson to be—

I own I like not Johnson's turgid style,
That gives an inch the importance of a mile,
Sets wheels on wheels in motion, such a clatter,
To raise one poor nipperkin of water,
Uplifts the club of Hercules—for what?
To crush a butterfly or to brain a gnat.

PEE DEE.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Home of the Partridge.

IN the year 1670 Daniel Denton, of Hempstead, Long Island, described the fauna of the island in the following language: "For wild beasts there is deer, bear, wolves, foxes, raccoons, otters, musquashes and skunks. Wild fowl, there is great store of, as turkeys, heath-hens, quail, partridges, pigeons, cranes, geese of several sorts, brants, wigeons, teal and divers others."

Unfortunately for local sportsmen, the members of the gunning clubs and the pot-hunters of modern times, have nearly completed the work of destruction begun by the early settlers with flint locks and their snares and traps. The bears, wolves, raccoons, wild turkeys and heath-hens are extinct, and the deer and partridge are exceedingly scarce. Of the upland birds the partridge is certainly the gamiest bird left. They may still be found wherever there are timber lots of considerable size, bordering on the cultivated fields.

A favorite haunt of the partridge is in the vicinity of the clearly defined line running through the island, which divides the hardwood trees, the oaks, hickories and chestnuts on the north, from the pitch pines and shrub oaks on the south. The latter extend over a plain through the center of the island. Through these shrub oaks and pines are old wood roads, which are only used when pine or the hardwoods are large enough to cut off for timber or firewood. These wood roads are not used to any extent oftener than once in twenty or thirty years, but they make a clearly defined trail, and are much easier to get through than the adjacent shrub oaks woodland. The quail is domestic, and usually keeps pretty clear to the farmhouses and cultivated fields to the north of the pine

are especially interesting. The roadbeds in the fall are often brilliant with the golden rods and asters, while the young pitch pines have a healthy and invigorating fragrance. A person may travel for days through these old roads—not fifty miles from New York City, and within sound of the church bells of large towns, and never meet a living soul, unless it happens to be during the deer hunting or wood chopping season.

An occasional pitch pine stands solitary and alone like a grim sentinel keeping watch over the plains. The large trees have escaped both the forest fires which sweep over the plains every few years, and the woodman's axe. They are a striking feature of the landscape, and furnish an excellent landmark for travelers over the plains.

QUAHAUG.

Spring Shooting in Michigan.

BINGHAM, Mich.—At present I am in camp on Carp Lake, Leelanau county, Mich. I presume my cook outfit stands very near where Kingfisher used to depart for Mrs. Nolan's. I have been on this lake each spring since 1886—not for sporting purposes, however. Never have I known the shooting that is going on now. The Michigan spring shooting law is working all right. Guns in the morning and guns by moonlight in the evening. If the poor sawbills are able to lay an egg without getting it shot at, they will be lucky. The loons are fewer and more discreet.

Since I have known this lake, sawbills and loons have nested here and reared their young in safety till now. I have always taken it as among my pleasantest experiences, to meet a mother sheldrake and her brood taking a

THE HOME OF THE GROUSE.

lands; but the partridge, especially during the latter part of the open season, is often found in the pine groves and shrub oaks, bordering on these wood roads. In gunning in the shrub oaks one is often surprised to see a partridge flushed by his dog alight on the lower limb of a pine or oak and complacently watch the dog. A shot under such circumstances may be excused when the difficulty of getting at birds in the provoking tough shrub oaks is considered. In pines and shrub oaks a bird in hand is worth at least a dozen in the bush.

To the lover of nature who travels with a camera rather than with a gun, these wood roads and the tall pines, with their rugged and blackened trunks and straggling limbs,

sun bath on a fine morning. They made no advances towards intimacy, of course, but I never have failed to keenly enjoy meeting them. There was an old abandoned scow at one time floating in the lower lake, filled with water, decks too, and with just the right slant to the deck, which was awash on one side, for young sheldrakes. This scow grounded not 50ft. from my tent. Almost any bright morning my wife and I would look out and find one or another of the broods there "taking the sun"—not quite as a sailor does—but just as effectively. I think we once counted over twenty in one brood. I believe they would have made our acquaintance in due time, but the wind came off short and carried the scow away. "Our"

wild fox squirrels eat with us mornings in Ann Arbor, in our dining room. I guess the sawbills and we might have somehow managed to become "introduced." Now, if you see a sawbill at all you will do the searching, the fowl will not. I have once this week heard the loon's voice at evening—I have seen none yet. This is "spring" shooting. I am moved to further inquiry. Is there no one in the State but "spring shooters" that they must be so carefully provided for?

I have been reflecting on game laws and the Plank a little lately, and it appears to me in this shape. The wild creatures, by law I understand, belong to the Commonwealth. Then game law reduces to this: Let the person who wants game go and get it himself, or herself, and let that person take only what their needs require—no more. Their needs may include the sick, properly, I think. But no sale, no slaughter, no catching fish by the hundred-weight and burying them in the ground behind the house, as has been done on this lake, I am told. To the above add just provision for the non-resident and for big game, and quit. The real game law is like the Kingdom of Heaven—it is within. The statute must be otherwise, as that applies to the coercion of those who must be controlled.

P. S.—I have not "jumped" Kingfisher's "claim," and should he call, there will be a welcome and a cup o' tea for him.

J. B. D.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

Where to go.

ONE important, useful and considerable part of the *FOREST AND STREAM*'s service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

On the Shenandoah.

WHEN reading the pages of *FOREST AND STREAM* (always interesting, by the way), one often sees the remark that it is seldom one writes of his trips when his kill or catch is not up to the usual standard—aye, beyond the usual; for it's one's successes that are usually given to the public, his failures are kept for his own silent meditation. But being one of those who believe it is not all fishing to catch fish; who, if his trip is otherwise satisfactory, is content that his catch is small (though hoping that the next time it will be larger), I want to tell you of an enjoyable trip I have just had to the Shenandoah, at Riverton, Va.

I am one of those who would be listed in your journal as "chained to business"; for that reason the more fully appreciate an outing, and when business, water and weather combine to make it possible to reach Riverton on the 15th of May, the opening of the bass season, I feel

Kenner Dam, North River.

that I am particularly fortunate, and, indeed, the engagement must be most pressing to keep me away.

Riverton, itself, is a pretty little town, about eighty miles from Washington, situated on both sides of the Shenandoah, but that portion mostly seen by the fisherman is built upon high ground just between the North and South Branches of the Shenandoah River, which join here and thus form one river. Two railroads, the Southern and the N. & W. pass the town, and within a stone's throw of the Southern depot is the Kenner House, a fisherman's haven, kept by a most genial host, Joe Kenner, ably assisted by that better half, a help-mate indeed. Here a fisherman has a hearty welcome. Good rooms, an excellent table, bait and boat (if notified in time), and what one appreciates much, an earnest effort to please. If Joe Kenner and that estimable wife of his do not make you soon feel at home, then you are hard indeed to satisfy.

About equi-distant from the hotel are two dams, the one across the North and the other across the South rivers. That on the North River is known as the Kenner dam; the other, the larger, is the dam to the Riverton Mills, a large flouring establishment, owned largely by Northern capitalists, and doing a most thriving business, as can be readily seen from the enlarged capacity and new buildings erected in recent years. Here also is the

Carson Lime Works, running night and day, "and Sunday for a variety," as one might say; and woe to the fisherman who is just opposite at noon or 6 P. M., when the blasting is done, for the rocks that then rain around are somewhat harder than hail—at least, they used to be.

Two rock-crushing establishments are also here in active operation, grinding rock for railroad ballast.

And one must not forget the Duck Farm. It will pay you to visit it. When I was there they had 4,000 ducks within the enclosure, and it was not a good day for ducks either, for I was informed that if the eggs, soon to hatch, turned out as was expected, 10,000 ducks would be on hand. Just think of it!

But what about your trip, I hear someone ask. In fact I had gotten off from that, hadn't I?

Shenandoah is supposed to be governed by a special law. I use the term "supposed" advisedly, for you hear some doubt expressed, and then again it would appear that whatever the law, it is not enforced as it ought to be. To my mind the special act clearly governs. Its open season commences the 15th of May, the date that the majority of the other streams in the State are closed

This is the picture which Mr. White sent us, not necessarily for publication, but as a guarantee of good faith. It shows him on the abutment of the Kenner Mill.

to bass fishermen. That the date is a good one. I have serious doubts; that the fish had not then finished spawning was shown by those I caught and that they were then spawning. I attribute, in part, my small catch. My wife and the little girl had gone ahead of me. She had friends near by to visit, and was to join me at Riverton on Sunday, the 14th. This she did. My friend, T. C. Pilcher, farmer, legislator and good fellow generally, is wont to say, in speaking of a trip from home, "If you want to have a nice time take your wife with you, but if you want to have a good time, go by yourself." This time I not only took her, but had a good time also. Well, there are exceptions, you know, and doesn't it depend somewhat on the kind of wife she is?

My friend and fishing companion, M. B. Payne, as good a fellow as ever lived, had talked over this trip far more than once. But a few seasons before I had initiated him into the joy of feeling a bass at the end of your rod, and thenceforth he became an ardent disciple of Walton. There lives at Strasburg, not many miles above Riverton, a most successful bass fisherman. In fact, his reputation is widespread. I am informed that he is of the Baptist faith—of the old school or hardshell kind; that he himself sometimes preaches, as well as fishes, and I am informed that amongst his trueisms is the following. "That a man isn't worth a — till he catches a bass, and after that he isn't worth a — for anything else." Now, I never heard him say this, but it is nearer the mark than much that passes for truth, and in this I think Podgers, whose Commentaries so often appear in your columns and are as often enjoyed, will, judging by his commentary of May 3, agree with me. While the whole of the quotation above could not be applied to friend Markham, still that fish with a few others added to the string, was the prime cause of his expending some thirty-odd dollars of these worldly goods (and he gets his tackle at wholesale too) in the necessary equipments for a successful trip—if the fish had bitten. Was it the newness of all this tackle; the fear of this mighty angler that confined his catch to one and mine to ten on that trip? Who knows?

But this is digression. My wife and the little one had gone ahead; the oldest boy off at school, and only myself and the other boy at home. When Payne and I drove off Sunday morning to Marshall, twelve miles, to take the train for Riverton and thus save a much greater distance around by train, didn't the little fellow look on longingly for the trip, and the day before he had been disappointed on account of rain in taking a promised and much-talked of fish with some of his boy friends.

Riverton was reached in safety, and I was hardly out of the train before the arms of that little girl were around my neck, even if I did have to get on my knees for her to reach me. The day was an ideal one. How enticing the water looked! One could imagine that in yonder pool a bass was only waiting to be hooked, and one asked himself if under such circumstances one might be excused for breaking the Sabbath and the law as well by then and there trying his luck. The day was spent in viewing the beautiful scenery in and around Riverton. Some of the views are lovely; the mountains grand. The climb of the very high hill just across North River and opposite

the lime works will well repay the effort. During the trip the camera was brought into play and some beautiful views obtained.

The next morning we were up and out early, but our catch was only three before breakfast. After that we went across the North River—it was clearer than the other—and fished from the abutment of the Kenner Dam. It was not long before I had on my string a medium-sized bass. About that time my wife came where we were, and as she had not become an expert in this art, I wished to see her land a bass, though she would insist upon my first hooking the fish. Pretty soon I have a strike. At the proper time the hook is fastened where a fisherman likes to find it, and I was just turning the tackle over to her to land the catch, when, hold! no bass such as I had been catching could make that break; the strength of that fish is beyond those already caught; I had better land that fellow myself. The water was swift; there was a good bit of line out; the tackle was light, though strong, and the fish was game to the backbone. If you have been there you know how it is. Perhaps the sensation is not one to be remembered! Gradually I get him closer to the abutment on which I am standing. A sluiceway from the mill seems to offer him a place of safety, and it took some good steering to keep him away and save the line from fouling. At last Mark has him in the net, and a beauty he is. How much did he weigh, you ask? Only 2½ lbs. Can the scales be right? He looks larger, truly, but another pair give him the same weight. Not so large, for I have caught them in this same river double this weight, but when one whose landing I enjoyed more? There and then I said I had been paid for the trip, come what might thereafter. And so I was. Could I fish daily, as many do; could I often make record catches, as is sometimes written about, doubtless an instance like this would hardly be remarked. Is it the "unchaining" for a few days that, like sauce, gives relish to the sport? The camera was nearby, and it had been my intention to get a "snap" when landing the fish, but the fish had been landed and was on the string before the camera was again thought of. Other fish that morning of good size were caught, though few in number, and this, notwithstanding we both fished industriously. Poor Payne, never a murmur, or even a "cuss" word, but I did want to see him have better luck; indeed he deserved it! The next morning, still full of hope, we were up early, indeed earlier than the morning before, getting out near 4 A. M. When I got on the river I could but think of Mr. Mather, who doesn't believe in early rising to the end that the early riser will catch the fish, and wondered if we or the fish were to be fooled that morning. And I must confess that as I grow older I am more than ever inclined to the belief that such early fishing does no good. My theory seemed to be at fault, at least that morning, for ten minutes before 5 I had a fish; twenty minutes afterward another, and a third before 6; and though I fished almost continuously the rest of the day, and in different portions of the river, not another one could I get. That these were not all the fish in the river was shown by the fact that other fishermen were having fair luck, and particularly that veteran fisherman, P. B. Law, of Culpeper, who delights to spend a day to himself, with gun or rod, as the season allows, though an entertaining talker, and, like most true sportsmen, a thoroughly good fellow.

Wednesday morning was rainy, but one fish was caught before train time, and with no unpleasant incident to mar the pleasure of the trip, adieux were said, with

Riverton Dam, South River.

promises to come again, and as I write I have a longing wish to go again and try my luck in that most beautiful water.

C. M. WHITE.

WARRENTON, Va.

Cayuga Lake Fishing.

UNION SPRINGS, N. Y., May 24.—I believe, and other competent judges from Brooklyn and elsewhere, who have fished in the Adirondacks and on the St. Lawrence, maintain, that the fishing at this point on Cayuga Lake is unsurpassed anywhere in the State. We have perch, pickerel, muscallonge and black bass in abundance, but it is a little early yet for the best success. I send you herewith a photograph of the catch of one man, taken in less than three hours by trolling one afternoon last summer, the four largest being muscallonge and the others pickerel, the smallest weighing 2 lbs. and the largest 12½ lbs., and the total weight amounting to 46½ lbs. There are also salmon trout in our lake as well as blue pike and whitefish, but our local fishermen have had but little experience and poor success in catching these last.

F. D. P.

The *FOREST AND STREAM* is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

CHICAGO AND THE WEST

Movements of Western Anglers.

CHICAGO, Ill., May 27.—One of our most widely experienced anglers is General McNulta, whose angling lore covers the territory from muscalunge to salmon, and from tarpon to trout. Gen. McNulta starts this week with his friend, Mr. Thomas A. Murdock, of Reid, Murdock & Co., for a salmon fishing sojourn on Mr. Murdock's preserve on the York River, Gaspé Basin. Mr. Murdock has fifty miles on the York, some of which he owns in fee. The prospects appear good for these two gentlemen.

Mr. E. F. Selz, of Selz, Schwab & Co., piloted by Mr. J. E. Strong, of the same house, start to-night for Dudley Post-Office, on the Prairie River, via Merrill, Wis. They should hit this lovely stream just about right now, and I predict for them a very pleasant outing indeed. I understand that Mr. Strong will spend a couple of weeks there.

Messrs. O. von Lengerke, C. H. Lester, Walter Dupee and their friends, Messrs. Cole and Tichenor, returned to-day from a very successful bass fishing trip at Oconomowoc Chain, Wis., where they averaged something like sixty bass a day to each boat, the party dividing up, two in each boat. I saw Mr. Von Lengerke this morning, and he seemed very brown and happy. He said the bass ran in weight from 1½ to 4½ lbs., and were taken by casting minnow. Some of the time they bit very fast, the best of the sport being for about an hour each day. The bass were all big-mouths.

Mr. W. P. Mussey and wife left last Sunday for Kabbekona Camp, Minn., and were met at Brainer by Mr. H. G. McCartney, owner of the camp, who was just coming out. It was then Tuesday afternoon, and neither Mr. Mussey nor Mr. McCartney was happy, for it seems there has been a change of time in the railroad north of St. Paul, by which the passenger train on this branch is laid off, necessitating a lay-over of twenty-four hours. This means serious inconvenience to those visiting this famous place, and Mr. McCartney was very much troubled, and is still seeking the remedy, in hope that the railroad will restore the original time table, which made it possible to leave here one night and reach the camp the following night. Still, if one is going into the wilderness, he ought not to expect to get there all at one jump. I imagine that the anglers will continue to go into the Woman Lake Chain in spite of the enforced lay-over.

Dr. McDonald and Mr. J. E. Callahan are still at Kabbekona Camp, and I presume by this time may be having sport. Mr. McCartney reports the water still very cold at the time he left, and the bass not biting very freely. He did not fish very much himself, and caught but one muscalunge, which weighed 20 lbs.

Regarding this fish, Mr. McCartney tells a singular story. It was a very thick, fat fish, and of extraordinary vitality. Having no better means of killing it, the boatman stuck the blade of his knife through its head. Instead of quieting the fish, the effect was quite the reverse, for after a time it began to thrash about in the boat, and seemed on the point of getting out. The guide again thrust his knife blade through the head of the fish, remarking that he supposed that would find it. They then piled clothing and packages on the fish to hold it from jumping out of the boat. An hour and a half later, when they took the fish out at the hotel veranda, it was my no means dead, but had strength to spring up and turn completely over from its position on the boards. I presume the cool weather had something to do with it, but I have never heard of a muscalunge living so long out of water.

Col. J. S. Cooper, of this city, has received from Grand Rapids, Minn., a tracing made upon a large piece of paper from a muscalunge, which is reported to have weighed 46 lbs. This is a very unusual weight for this region, and quite surpasses any I have seen reported for many years. The figures, however, are not supported, and no details are available concerning the matter.

Apropos of the matter of muscalunge weights, I must add the testimony of Mr. J. Garrard, of Frontenac, Minn., who writes me, "You should not call in question the weights reported of muscalunge, as you once did of a fish taken in the Mississippi River at the mouth of Crow River, of 65 lbs."

"That one taken near Pittsburg measured 5 ft. 6 in. The weight was not given, but could not have been less than 75 lbs."

"Reports of early settlers give weight of one taken in Lake Pepin at 90 lbs. With pole through the gills, resting on shoulders of two men, the tail dragged the ground."

"The hunters and lumbermen in the Wisconsin woods speak familiarly of their being as big as a man."

"The rough-backed sturgeon (lately written about by you), is a favorite article of food, and is largely used as a smoked fish. The weights go as high as 110 lbs. in Lake Pepin."

I am to-day in receipt of a letter from the redoubtable Fred Mather, who is adding to his varied experiences by acting as Superintendent of Mr. H. C. Pierce, Cedar Island Lodge, at Brule River, Wis. It would seem that Mr. Mather is getting around to the scenes of his earlier days, and I am rejoiced to discover that he has escaped from the enervating atmosphere of the East, and has come into a region where "the best is like the worst."

Messrs. Fred Peet, Harry Hascall and their friend, who, I understand, is sometimes called "Stonewall" Chadwick, will start within ten days for another trip to the trout waters north of Grand Rapids, chiefly the Pere Marquette. They ought to meet the sport just about right, as the season has been late in Michigan thus far, as indeed it has been all over this portion of the West.

Around Grand Rapids.

I passed a few days at Grand Rapids, Mich., this week, engaged in business only. Knowing what would be the result if I met John Waddell, Harry Widdicomb or any others of the fly-fishing contingent of that sportful city, I consistently dodged them all, for I did not have time to go fishing, and had hedged against my weakness by not even taking my fly-book or rod along with me. Yet, one day at lunch at the Peninsula Club, I fell into a perfect

nest of Anglers, including both the gentlemen above named, whom I had been dodging, with Mr. C. L. Lockwood, general passenger agent of the G. R. & I. Railroad (whose very fish plates smell of trout); Mr. W. R. Shelby of the same road, with Messrs. Maddox, Bundy and others there present, each of whom had a fish story as long as your arm, and each of whom also was ready to go fishing again.

"Come along with me," said Mr. Widdicomb, "I am just going up to the Boardman angler, and I want to show you what we can do up there." "Just you wait over until Saturday," said Mr. Waddell, "for I am going up again, and I want to show you the Pere Marquette. You don't need any rod, waders, flies or anything else; we've got them all waiting for you. You mustn't go away without a trout fish." It takes a good deal of nerve to break away from invitations like these, especially when a fellow is rather weak on the trout side anyhow, but I could not go, and so had to content myself listening to the reports of the good times all these other folk had had.

Messrs. Shelby, Barnhardt and Widdicomb were just back with well-developed cases of Boardman sunburn. They found the water pretty full in some sections of the river, but they got about 150 trout, some very nice ones indeed.

Mr. John Waddell, the rainbow fiend of the South Peninsula, reported good sport on his trip of a few days preceding on the Pere Marquette. Mr. Waddell's heaviest fish on this occasion was 1½ lbs. He bemoaned the cruel fate which called him away just as the rainbows were jumping in the evening. He tells me that the best time of day is just before dark. Mr. Waddell promises me a complete refutation of the entire Taylor system of casting. His own style of fishing is quite different, and he catches a great many trout yearly, and is convinced that he could not do this so regularly if his own system were not pretty near correct. Mr. Waddell is a great believer in the doctrine of persistence, and believes that a good many trout fishers fail because of fishing the water too fast. Mr. Bundy, who was of our circle, and who, by the way, tells me he was a college classmate of the Editor of FOREST AND STREAM in the days of auld lang syne at Amherst, reported that his trip on the Au Sable, with his friends, Messrs. McKay and White, was a complete success. They caught about 120 trout one day, and had all the sport they cared for. Mr. Bundy told me, what I had never known, that the Au Sable can be waded and fished for a great part of the way. I always thought it necessary to use boats on that stream, and indeed it is the custom to take boats at Grayling and run down some miles before fishing. There are a number of camps and club houses along the stream nowadays, so it is not necessary to take a tent. The Au Sable continues its grand record as a trout stream, and some fine rainbows are taken there. The warden work on the Au Sable is reported to be very efficient, and indeed it would seem to be highly desirable that something be done to preserve this splendid water. Mr. Bundy told us of one Detroit party who fished the Au Sable, who ate fish as they liked in camp, and who took home with them to Detroit, 1,800 trout. This would seem sufficiently horrible. Not quite so good was the record of a party who took out 1,100 trout from the same stream last year. Such fishing as this will ruin any trout stream that we have.

I learn that the Pere Marquette River is being fished very hard this spring, and is being robbed of hundreds of fingerling trout, which ought to be returned when caught. From all reports the Michigan streams are keeping up very well. The Boardman is as good this year as usual, though it has not been stocked for some time. This stream I should expect to be better later in the summer, more especially for big rainbows.

It takes big waters for big fish, as most fishers know, and as we discussed these matters in general conclave that day, it was determined that in some cases there can be too many trout in a stream to make the fishing good. The Rapid River of Michigan was cited as a stream where very few large trout are ever taken, though it is full of small-sized ones. It seems to be one of the necessities of nature sometimes that fish don't get half enough to eat, though they live along apparently not unhappily for years and years. Big feed means big fish, and a stream can be eaten out as well as fished out, though customarily in these days the latter situation is more apt to trouble us than the former.

The Grayling are Not Gone.

The common supposition is that the grayling is extinct, and this is perilously near the truth, though not absolutely true. It is a good fortnight which allows one to chronicle a flight of wild pigeons and a basket of grayling. Yet at Grand Rapids I learned that there had come to town from Luther, Mich., a nice take of trout, with which were included twelve grayling. All the fish were taken on the Pine River. It has been known for some time that one might once in a while take a grayling on this stream. It is a good trout stream, though very apt to get high and roily in case of rain. It is a trifle difficult to fish, and this fact perhaps has preserved the grayling. Mr. Bundy said he heard of grayling along the Au Sable, and thought one could be safe on a trip of a week or so to take several grayling in the tributaries of Au Sable.

The Maple River, once a magnificent grayling stream, has not reported any grayling for some time, so far as I know. The Maple River is reported prime just now for trout.

Col. E. Crofton Fox, one of the Grand Rapids fly-casting enthusiasts, is not doing any fishing this spring. Col. Fox has bought some zinc mines down in Missouri, and is chained to business. I regret to report this lapse on the part of so thorough a sportsman.

In the Grayling Days.

At Grand Rapids I had a short talk with Mr. J. H. P. Hughart, general manager of the G. R. & I. Railroad, who is an ardent and skillful angler, as well as a thorough-going railroad man. Mr. Hughart showed me four quarts of flies which he had just received from his favorite maker in Scotland, and which he purposed employing at an early date along the Michigan streams. Mr. Hughart may perhaps be called an old settler in Grand Rapids, as he came there along in 1874. Naturally, he soon became infatuated with the magnificent grayling fishing which prevailed in those days in most of the

Michigan streams, and he sent back to his old friend, Thad Norris, to come out and have a fish with him. They started in pretty well toward the head of the Manistee River, where they heard that a party of trappers had gone down with the boats before them. This last was true, but the trappers had gone during the high water of the spring, and the clearings they had made in "brushing out" was several feet above the heads of the party who tried later in the year. This was in the fall of 1876, and Mr. Hughart and his friend were nine days in getting down a paltry bit of the river. Then they hit upon such grayling fishing as will never be known upon earth again. They could anchor their boats in any pool and catch all they cared to, doubles and trebles more often than singles, until finally old Thad Norris quit in disgust, saying that a tenderfoot could catch more fish than an expert.

Official Trout Trip.

In the city they have theater parties, in the country trolley parties, and in Michigan they have trout parties, as witness the fly-casting tournament of last year at Grand Rapids, when the railroads took everybody out on a grand tour of the trout waters. This year it was the Detroit and Mackinac Railway which took a notion to celebrate by giving a trout party, and the function assumed something of an official nature. The personnel of the party was composed of Messrs. J. D. Hawks, president and general manager of the Detroit and Mackinac; C. W. Luce, general superintendent of the same road; T. G. Winnett, general freight and passenger agent, and D. J. Casey, chief engineer. These may be called the hosts of the occasion, the trip being into some of the trout country touched by the D. & M. Others of the party were Messrs. C. L. Lockwood, general passenger agent of the Grand Rapids and Indiana; H. F. Moeller, general passenger agent of the Flint and Pere Marquette Railway; E. H. Hughes, assistant general passenger agent of the Grand Trunk Railroad; these closing the list of the railroad men proper. Associated with them were Messrs. Clark and Yates, of Detroit, and State Warden Harry W. Loveday, of Chicago, who went along with Mr. Hughes, with one or two other friends, who joined the party at points up the road. There were three cars, each marked special and private, which carried this party, and the objective point was near Hale Creek and Smith Creek, two lovely meadow streams about fifty miles north of Bay City, and ten miles or so from Tawas City. Here the party remained three days, coming out early this week. They took about 500 trout, and a ripping good time in spite of the mosquitoes, which were new and hungry. I saw Mr. Hughes on his return, and his hands were badly swollen from the bites he had received, he having forgotten his bottle of fly dope. The trout of these two streams do not run so very large, but are very brilliantly marked. Every man in the party was satisfied with the sport he had, and willing to vote that an official trout trip can be made a distinguished success.

Mr. C. L. Lockwood, general passenger agent of the G. R. & I., who was with the above party, tells me regretfully that he fears it will be his last trip for some time, it being his fortune to be a lover of trout fishing, but obliged to take care of a business which in the spring and summer is much concerned with others who are lovers of trout fishing. I can see only one possible objection to living in Grand Rapids, which is a very delightful city of itself, and that is that I might have to get tangled up with some sort of work there, and be obliged to look on at the people who came through merrily bound for the trout country just beyond. To live in Grand Rapids and not go fishing would be to die unblest.

I wanted to see a business man in Grand Rapids, and called four times, but found his desk shut and finally learned from the office boy that he had gone fishing and left no word when he would come back. I called on another gentleman, Mr. D. H. Armstrong, and he explained to me that he must soon be going, as he had an engagement with a friend to go fishing that afternoon. The pickerel are now running in the Grand River, and I saw a number of fishermen along that stream who were casting and trolling. There is trout fishing too, within a dozen miles of Grand Rapids, but everybody goes further away from home than that for trout.

Lingering Touch.

Mr. H. English, of Von Lengerke & Antoine, of this city, came back from Long Lake, upper Illinois, one day this week with a fine lot of bass and a rolb. pickerel. Into the mouth of the latter he had carefully inserted his hand in order to get a good hold on the fish when landing it. His fingers look as though they had gone through a coffee mill, though it is only the lingering touch of the pickerel.

Drowned while Seining.

An odd bit of protective work comes to light near Waukegan, Ill. Nearly a month ago several men went out fishing, on Sunday, and one of them was drowned. It appeared later that the party were seining, which was illegal. President Nat H. Cohen, of the Fish Commission, got word of this, and sent a deputy, who arrested all the others who had been in the seining party. Surely these men ought to feel that they would not care to use a seine again.

In Comment.

Editor Forest and Stream:

I must say something. Next after Fred Mather and Robinson and Hastings, the best thing I have seen is Mr. Rogers' story in your last issue. I have laughed until the water closed my eyes. Rogers with his pole and his "magenta sky-blue moth with a pink tail." Well, well, and a 2-pounder. No wonder he considers himself "a trout killer." But really such things as these make your paper, and I can appreciate all of his article. I know, and what old brook fisher does not, of the ten thousand limbs and leaves back of him on a trout brook. I would like to take Rogers by the hand, look into those eyes of his—they must be jolly ones—and say "Good for you."

I miss the Major (Fred Mather). I hope he is having good success in old Wisconsin. Many a good day I have put in there in that old Badger State. I trapped there two years, and then game was abundant, deer in plenty,

and the sloughs in the spring and fall overflowing with ducks; and ruffed grouse and pigeons everywhere. By the way, I see that these interesting birds are coming back to us again. They are not extinct by any means, but where in the land of the living have they been for the past years? JACOBSTAFF.

Capture of Young Atlantic Salmon.

ON May 10 the writer's attention was caught by two little salmon lying on a fish merchant's stand at No. 24 Dock Square, Boston. The two were not very unequal in size and weighed 8oz. The employee who showed them to me said they were "salmon trout," and had come from Connecticut in a box of brook trout.

The fish, of course, were easily recognized as young Atlantic salmon, and the red spots on their sides gave evidence that they had been taken in fresh water, for it is well known that young salmon acquire a silvery coat before entering the ocean, or, at least, lose the red spots soon after they go into salt water.

Mr. Eugene G. Blackford informed me, while in New York a few days earlier, that he had recently sent to the United States Fish Commission, Washington, D. C., a young Atlantic salmon weighing 3 or 4oz. that was received from Bayside, N. J., in a box of shad. Bayside, I am informed, is on the Delaware River.

It would be interesting to know the exact source of the salmon found in Marshall Johnson & Son's establishment in Boston. They may have been reared at some private fish hatchery and shipped with the brook trout inadvertently, but the probability is that they originated from artificial planting, or natural reproduction, in the Connecticut River, which was formerly a salmon stream. It is easy to account for the presence of young salmon in

cation. That is usually sufficient for the purpose intended; but sometimes the most important characters are overlooked and the sketch fails to accomplish its object. The specimen is the thing to send whenever this be possible. If there be no other means at hand common coarse salt water may be used successfully, always remembering that the belly must be filled or the viscera will be spoiled. Fish thus packed can be shipped by mail as merchandise or natural history specimens. TARLETON H. BEAN.

CHICAGO, Ill., May 20.

The Salt-Water League.

NEW YORK, May 24.—*Editor Forest and Stream:* The New York Sun of this morning has an editorial on the league, of which I ask you to reprint these paragraphs:

"There has been a great deal of misunderstanding in regard to the dispute between the net men and the line men. The newly-formed anglers' league is not the creation of fools who would interfere with the reasonable and legitimate rights of the netters. Everybody knows that nets must be used to supply the markets; but few people believe that only a fourth of the choice game fish caught in nets should go to the market and the rest allowed to spoil, to be tossed overboard, or converted into material for manuring potato patches. It is against this shameful waste of food fishes that the anglers are now leagued. Of course, the spoiling of their sport has much to do with the position they have taken. This they admit frankly like honest men, and it is not at all improbable that a compromise may be made between them and the netters, by which the latter might endeavor to limit their operations to the necessary market supply. For instance, they might stop netting to some extent at least during the

unlawful netting; and where practicable to provide in place of unlawful netting the more profitable lines of industry of boating and providing for the wants of the anglers. He announced a list of committeemen, one each for the several assembly districts throughout the city.

New England Fishing.

BOSTON, May 27.—Returning fishermen still complain of poor luck. Such is especially the case on certain Maine waters, though one to read the papers running fishing departments would be led to believe directly the opposite. The Brackett and Clark party is back in Boston. Mr. Emery came out early, completely discouraged. He caught only four fish in a week's fishing. Mr. Brackett stayed longer, determined to take some fish. A few days ago some of the gates were closed at the Upper Dam, and there was then good fishing in the pool below. Mr. Brackett took nineteen trout in one day, some of good size. Much displeasure is expressed by the early fishermen in Rangeley waters concerning the smelt. They are inclined to believe that their lack of success is due to the fact of the trout being too well fed on these smelt. The last suggestion is that the smelt may destroy the minnows—generally dace—that have been the food of the trout from time immemorial, and that if the minnows disappear, what becomes of the trout? One cause of this suggestion is that the lakes and ponds that have abounded in smelt have not had minnows in abundance, while the Rangeley waters have always been noted for the great abundance of minnows, and hence the great size and abundance of the trout. There were never any smelt in the Rangeleys till put in a few years ago by the Maine Commissioners, for the purpose of food for the landlocked salmon.

Good catches of trout are reported from the Northeast Carry, Moosehead Lake. May 18 Mr. and Mrs. A. D. Foster, Reigold Foster and J. G. Wellman brought to the Winnegarnoc House one of the finest catches of the season, or of many seasons, for that matter. In six hours' fishing they took twenty-three trout, the total weight of which was 77lbs., an average of nearly 3½lbs. each.

Upper Dam, Me., May 29.—Fishing is much better here, and all through the Rangeleys. C. M. Parker, of Brockton, Mass., has caught a salmon of 7lbs. Mr. Coburn, of Lawrence, Mass., took a fine salmon in the pool below the dam here, Tuesday, which weighed well up to 6lbs. He is greatly pleased with this catch, though having done well with trout previously. He and Mrs. Coburn occupy one of the private cottages here. The Winney and Gormely party is smaller this year, but as successful as ever. These two gentlemen caught twelve trout one day last week, the string weighing over 20lbs.; largest 4½lbs. Mr. C. A. Stearns, of the Camp Stewart party, surprised the fishermen at the dam a little, Thursday, just at dusk. He had just got in, and cast his line over above the dam, where half a dozen others had been fishing betimes all day, without success. In a moment there was a swirl, and he soon had a trout of 4½lbs. H. S. Kempton, of the Boston Herald, took a fine trout of 2½lbs. before breakfast the same morning. He was scarcely gone from camp half an hour. J. D. Pickslar, of Orange, N. J., took six trout the other day, the largest weighing 4lbs., and two of these. The Birches is full of guests. The Mohawk Fishing Club is there. Other fishing guests are O. C. Davis and a friend, of Brockton, Mass., and W. Ellison, of Newton. Another party is composed of Police Inspector G. M. Robinson, Boston; A. M. Douglass, Boston; James F. Brennan, Peterboro, N. H.; T. F. Saff, Boston; Thos. F. Strange, Boston; John H. Kimball, Marlboro, N. H., and L. Wiswell, Marlboro, N. H.

SPECIAL.

Good Sport in Canada.

SOME exceptionally large catches of trout in the different club lakes north of Quebec, and unusually good sport with ouananiche, are the latest reports brought here by returning anglers. The boats on Lake St. John have now been running for nearly a fortnight, even before the whole of the ice had left the lake. This year the ice did not all sink as usual, but before it had time to rot and go down below the surface of the water, it was driven by the west winds to the head of the Grand Discharge, where it was taken in charge by the current and carried down the rapids, smashing up Price's booms above Chicoutimi. Unusually large numbers of ouananiche are being taken in Lake St. John itself off the Roverval shore by local fishermen, and anglers from the city have been making large catches at the mouths of both the Ouatchon and Metabetchon rivers. There has been such a remarkable dearth of rain in the Lake St. John country this spring that the water in the lake itself is falling very rapidly, and contrary to what was expected a month ago, the opening of the season in the Grand Discharge is expected to be as early as usual, notwithstanding the late breaking up of the ice. The middle of June ought to bring good sport in the rapids.

The trout lakes are already making full amends for the poor fishing that they yielded last year. All the anglers who have visited them during the last week or ten days report exceptionally good sport. Several members of the Triton Club were expected down by yesterday's train, but they sent word out that the sport was so good that they would stay with it a little longer. Some phenomenal catches are reported from the outlet of Lake Batiscan. A number of other American members of the club are in town, and leave for their preserve to-night.

Among those who returned here last night from the Lake St. John district on their way home, are Messrs. W. B. Hincks and E. G. Sperry, of Bridgeport, and Geo. A. Fay, of Meriden, who enjoyed fine fishing at Lake Kiskisink, on the Metabetchon Club's territory.

Mr. W. F. McCormick, of Florida, was in town this week from Lake Edward, and reports that he and his father have had some really good fly-fishing on the lakes and rivers back of Lake Edward, controlled by Mr. Robert Rowley. Mr. Follett has secured some very large speckled trout in Lake Edward itself.

Dr. Porter, of Bridgeport, is now fishing the Metabetchon Club waters, and Mr. Gregory, of Syracuse,

YOUNG SALMON DISCOVERED BY DR. BEAN IN BOSTON.

the Delaware, which has been the scene of numerous artificial deposits of fry and fingerling fish. It may be that salmon now spawn every year in the headwaters of the Delaware, and they may occasionally run into the Hudson and the Connecticut for the same purpose.

Perhaps if there were more Blackfords in the markets where fish are received in large quantities from nearly all parts of the coast and interior waters, we might learn a great deal more about our species than we know at present. Doubtless young Atlantic salmon are occasionally to be seen in various markets of the New England and Middle Atlantic States; but they are passed over as "salmon trout" or "hybrids" or almost anything but the right thing, and nothing is heard of them by interested parties.

FOREST AND STREAM publishes an illustration of the salmon secured in Boston in order that its readers may be able to recognize the fish, if they meet with it, and may report its occurrence for the information of the public, and especially that portion of the public that is trying to increase and spread a knowledge of the life history of our fishes.

Many anglers have inquired how to preserve specimens of fish which they know would prove interesting to museums or to special students. This can be accomplished in several ways: by packing them in crushed ice and sawdust (after wrapping them in paper), in acetate of soda, salt, or some similar preservative, or by placing them in a jar containing formaldehyd or alcohol and water. Formaldehyd (or formalin) costs about 30 cents per pound, and to one pound of the solution, commonly offered for sale, may be added nineteen pounds of water. Alcohol may be reduced by one-third of its bulk with water.

Whatever preservative be used it should be remembered that incisions must be made in the sides and belly of the fish, to allow the liquid to penetrate freely and preserve the viscera, always the most troublesome feature in preserving specimens. As the writer had no time to search for formalin, he bought a quart Mason jar, put into it a pint of alcohol and nearly one-half pint of water, then made a number of small openings in the salmon and placed them in the jar. The fish were sent to the FOREST AND STREAM office to be photographed, and will be permanently kept in a museum for study.

Commercial acetate of soda is said to be one of the very best preservatives for fish, especially in warm regions. It is cheap and effective. Dr. Vaillant, of the Museum of the Jardin des Plantes, Paris, informs me that his collectors use it with great success, and with very little trouble to themselves. Small specimens, under 6 or 8in. in length, are simply covered with the dry powder. Larger ones are opened on the belly and the cavity is filled with the soda. Before shipping to destination all the specimens are repacked in a fresh lot of the powder.

Anglers and other sportsmen and travelers in unfrequented regions (and, for that matter, in many well-known localities) often have it in their power to make contributions to science by means of the natural objects with which they meet. Many of them go to the trouble of making sketches and forward them to some specialist for identi-

spawning season, and raise their pounds and stop working the purses for one or two days every week during the summer months. That might benefit themselves in the long run and satisfy the anglers, the hotelkeepers and the shore railroad companies.

"The theory that the food supply of the sea can never be affected by any device of man is perfectly sound in regard to outside deep-sea fishing; but the notion that the inshore run of game fish cannot be turned back or affected by miles of pound nets stretching out in echelons along the coast is simply absurd. Evidently there is a little too much netting. It should be limited, and it would be better to have the change for the better made voluntarily by the dealers themselves than to have it forced upon them by a State Legislature."

This is just the support we have been looking for. The league seems to be progressing very nicely in its work, and I am very much delighted to see the papers giving us a lift in this matter. Our purpose surely is a good one, and we shall accomplish it.

J. BIEDINGER, Pres.

A meeting of the Protective League of Salt Water Fishermen was held at the Riverside Hotel in this city last Wednesday evening, Pres. Biedinger in the chair. About fifty members were in attendance, and the reports of President, Secretary Flidner and Treasurer Reilly showed progress. A number of stirring addresses were made. Mr. Edward Schott called special attention to the pollution of the waters by factory waste, and dwelt upon the necessity of increasing the membership of the League until it should become so powerful that it might be able to influence candidates for the Assembly and Senate, and oblige them to regard favorably and support the laws looking toward a more stringent system of preventing pollution.

Mr. Taxter said that while the bass fishermen who fish along the Hudson River were loud in their complaints of the very abuses which the League is striving to overcome, they did not join the League, and by their membership and personal participation give it aid. He urged that every fisherman interested in the Hudson River fishing should join the League.

Pres. Baywood, of the Baywood Fishing Club, an organization of the East Side, also dwelt upon the necessity of co-operation and united action by all concerned. The nets, he said, must go. He called particular attention to the bill now in the Governor's hands, relative to the Barren Island nuisance; and upon his motion the League adopted a resolution to petition the President to sign the bill. The address by Pres. Biedinger was of the most encouraging character. He said that he had had a conference with one high in authority as representing the netting interests, and had been warned that if any attempt to interfere with the netting industry were made, the League would find itself powerless, as the netters were banded together in a labor organization, which would not brook interference. But the purpose of the League, the President said, was not to injure any legitimate business, but was rather to put a stop to the

president of the Triton Club, is on the Triton tract with a party of friends.

The Lamentide and Stadacona Club limits are both yielding fine fly-fishing at present.

Colonel and Mrs. Collingwood, of England, have just arrived out from the Old Country for salmon fishing on the north shore of the Gulf. Mr. Plumb, of Detroit, who fished the Natashquan last year, will this year fish the Metapedia. Among those who will fish the Natashquan this year is Mr. Hodges, of Boston. Mr. Barney and other members of the St. Marguerite River Salmon Club are expected here shortly on their way down to their pools. Messrs. Edson Fitch and Veasey Boswell, of Quebec, and Mr. Allan and others of Montreal, have chartered a special steamer to take them down to their camp on the Moisie in about a week.

The annual meeting of the St. Bernard Club will be held at the club house at Lake Saccacoma on Monday, June 5, and the waters will get a good whipping that week from visiting anglers.

E. T. D. CHAMBERS.

QUEBEC, May 17.

Chicago Fly-Casting Club.

CHICAGO, Ill., May 27.—Following are the scores of the second fly-casting contest of the season:

	Long Fly, Feet.	Distance and Accuracy, Per Cent.	Accuracy and Delicacy, Per Cent.	Bait Casting, Per Cent.
J. D. Belasco...	90	77 2-3	79 1-3	78 2-15
I. H. Bellows...	120	86 2-3	92 5-6	95 2-15
C. F. Brown...	...	73	80 1-3	87 2-5
B. Goodsell...	112	84	90 1-3	91 4-5

Gordon—Irish.

DOYLESTOWN, Pa., May 23.—*Editor Forest and Stream:* "For Sale—Thoroughbred Gordon-Irish setter puppies. Write for particulars." The above "ad." is clipped from a local paper and has aroused some discussion. The impression which we suppose is intended to be conveyed is that the pups are a cross between a Gordon setter (in this case the dam) and an Irish setter (the sire). Could such a cross properly be described as "thoroughbred."

I do not wish to impeach the advertiser's veracity, but I have it from one who claims to know all about the case that the sire was not the Irish setter the Doctor claims, but a cross either between a St. Bernard and a mastiff, or a shepherd and a mastiff. What would the pups properly be called if this is true? Is there such a breed of dogs as Gordon-Irish setters?

[The cross between Gordon and Irish would produce cross-bred setters, not thoroughbred. The latter term is a misnomer when applied to the dog in any case. In respect to mastiff or St. Bernard cross, the progeny would be mongrel.]

Points and Flushes.

The E. F. T. Club has issued an elegant brochure, which announces its trials for 1899, contains a list of its officers, purposes and programme. On application it can be obtained of the Secretary, Mr. S. C. Bradley, Greenfield Hill, Conn.

Canoeing.

CANOEING NEWS NOTES.

The New York C. C. will hold its spring regatta on Saturday, June 10, at the club station, Bensonhurst, starting at 2:30 P. M. The programme is as follows:

1. Sailing, six miles, record event.
2. Paddling decked canoes, one-half mile with turn.
3. Tandem paddling, open canoes, single blades, one-half mile with turn.
4. Club fours, open canoes, single blades, one-half mile with turn.

In this event, for the first time in the history of the world, a crew of four real live savage Filipino chiefs will be pitted against a crew of four real live New York C. C. savages.

5. Tournament. Grand naval combat between Filipino chiefs and New York C. C. savages. Hospital ship will be in attendance.

AILEEN—NEARLY READY FOR LAUNCHING.

IDALIA ON THE STOCKS.

ALBERTA ON THE STOCKS—PARTLY PLATED.

EUGENIA—DECK, LOOKING AFT.

6. Submerged breathing contest between South Sea Islanders and any one else who cares to enter.

Note.—Any contestant remaining under water less than five minutes will be promptly tomahawked by the clerk of the course on arriving at the surface.

Members of all canoe clubs near New York are cordially invited to be present and take part in any or all of the events. In order to interest the ladies, a number of extra events have been arranged to take place during the sailing race, and between the regular events, so that the interest will never flag during the entire afternoon. The usual club dinner will be served at 7 P. M.

Regatta Committee—Barron Fredricks, chairman; R. S. Foster, Louis B. Jennings.

Yachting.

24. Burgess, 2d cham., Marblehead, Massachusetts Bay.
- 26-29. Sea. Cor., cruise to New London and return, L. I. Sound.

The New Royal Yacht.

THE accompanying illustration shows the new royal yacht Victoria and Albert, launched on May 9. In addition to the description published in the FOREST AND STREAM of May 20, the following particulars are given by the Daily Graphic:

The length between perpendiculars is 380ft., length over all 439ft., breadth 50ft., mean draft of water (under normal conditions of loading 18ft., displacement 4,700 tons, maximum indicated horse-power 11,000. The vessel will be propelled by twin screws, driven by two inverted vertical cylinder engines, each engine having four cylinders, and being placed in a separate water-tight compartment. Steam will be provided by eighteen water-tube boilers of the most improved Belleville type. There are two separate boiler-room compartments, each containing nine boilers. Two funnels will be fitted. The electric installation will be of a special character. It will provide not only for electric lighting of the interior, but for other applications of electrical power, including the working of lifts, pumps, hoists for boats, ventilating fans, the after capstan and heating the principal apartments. By using electricity instead of steam for these auxiliary services, it is anticipated that comfort and efficiency will be increased. As compared with the present Victoria and Albert, the new yacht has an additional deck, which may, for purposes of description, be regarded as built above the upper deck of the present royal yacht. This increase of the freeboard—from about 11ft. 6in. to 19ft.—was absolutely necessary to provide the desired accommodation as well as to meet the requirements for more powerful machinery and enlarged coal supply.

The state deck of the new yacht is about 10ft. 6in. above water. Between it and the upper deck are situated the Queen's apartments and those of the royal family, the cabins assigned to their suites, and those appropriated to the commanding officer and the principal naval officers attached to the vessel. The apartments of her Majesty resemble in their general arrangement those in the present Victoria and Albert, but they are more spacious, and a private dining room has been added. These rooms occupy the central portion of the state deck, where the minimum of motion in a seaway should occur. The apartments of the members of the royal family

are placed abaft those of the Queen, extending over a considerable length of the state deck. These are succeeded by the apartments of the royal suite. Rather more than half the length of the vessel is occupied by these three series of apartments, and a wide corridor extends from end to end, with convenient staircases leading to the upper deck. Above the upper deck, toward the after part, is built a large pavilion or saloon, which contains the state dining room, which will accommodate fifty persons, besides the reception and smoking rooms. The top of this pavilion forms a promenade. The grand staircase leads down from the reception room to the principal corridor on the state deck. Access from the upper to the state deck within the royal apartments will be obtained by a lift as well as by this staircase. Arrangements have also been made for entering the vessel at the level of the state deck, should that prove more convenient, either when she lies alongside piers or when passengers embark from boats and ascend accommodation ladders.

The cabins for the royal servants and for the servants of the suite are placed on the lower deck, occupying about half the length from the stern. On this deck also are placed the royal kitchen, pantries, sculleries, hot cupboards, etc., and all the service will proceed at this level to the lifts leading to the royal dining rooms and the dining room of the suite. Arrangements will be made for economizing labor as far as possible by means of lifts or other appliances. The officers of the ship have their cabins immediately forward of the middle of the ship, part on the state deck and part on the lower deck. At the higher level a large messroom is built, with all necessary pantries and fittings adjoining. The crew spaces are at the fore end of the vessel, where there are three decks, all with natural light and ventilation. Adequate provision has been made for messing and sleeping, for bathrooms and all other requirements. All living spaces on the lower decks have special ventilating side scuttles, giving light and air under all circumstances, even in bad weather at sea. In addition electrical ventilating appliances will be provided. Great attention has been given to the sanitary arrangements. Hot and cold water supply will be arranged to bathrooms and to the principal sleeping cabins. Electrical heating will be adopted in the state apartments, and steam heating elsewhere. In order to insure the greatest possible safety against fire the wood used in the bulkheads, fittings, and furniture of the new yacht has been subjected to a chemical treatment which makes it practically non-flammable. An efficient fire service of the usual kind has also been arranged for delivering water at any point where a fire may take place.

Probably by the early summer of next year the new yacht will be ready for service. Her general appearance

will somewhat resemble that of the present Victoria and Albert, but her greater size and higher freeboard necessarily involve departures from the earlier vessel. She will have three tall raking masts, two funnels, a clipper bow and an elliptical stern.

The new vessel was actually commenced on Oct. 25, 1897, though her keel was not laid until the 12th of the following December. She has, therefore, been under construction one year and six and a half months. The total cost of the vessel will be about £360,000.

New American Steam Yachts.

THE war of last year has given a stimulus to at least one industry, that of steam yacht building, as evidenced by the fleet of yachts now under construction to replace some of the twenty-seven craft purchased by the Government just a year ago. In most cases, we are glad to say, the yacht designer has profited as well as the builder, the majority of the new yachts being designed, though a few of them have been built haphazard, after the method which has produced so many serious failures in the past. The firm of Gardner & Cox, the well-known yacht designers, have had in hand during the winter four of the new steam fleet, the building being done by the Delaware River Iron Ship Building and Engine Co., "Roach's Yard," Chester, Pa., of which Mr. Irving Cox is manager. Two of these yachts, Aileen II., Richard Stevens, and Eugenia II., J. G. Cassatt, bear the names of their predecessors; the first Aileen, now used by the Brooklyn battalion of the Naval Reserves, and Eugenia, now Siren, of the U. S. Navy. The third, Idalia, replaces Illawarra, sold by Eugene Tompkins to the Government. The fourth and largest, Alberta, replaces the Watson boat, Zara, sold by A. E. Tower to private ownership last winter. The accompanying illustrations show the four under construction. Aileen, launched on May 13, is shown on the stocks, nearly ready for launching. She is similar to Malay and Sylph, built last year at Chester from designs by Gardner & Cox, the latter being now the "President's yacht." Aileen is 152ft. over all, 125ft. l.w.l., 20ft. beam and 9ft. draft, with 12ft. depth of hold.

Eugenia is considerably larger, being intended for ocean cruising, 176ft. over all, 144ft. l.w.l., 21ft. beam and 11ft. draft. The view shows the deck, with beams in place and fastened to the gussets, the steel plates joining them to the heads of the frames. The lower part of the frames and the floors crossed by the reverse frames are also visible. The timbers bolted to the deck beams are for the purpose of keeping them in fair line until the deck planking is laid.

A similar view, but looking forward instead of aft, is shown of the deck of Alberta; but in this case the stringer plate, lying on the top of the beams and next to the edge, is in place, also the steel angles on top of the plate, to which the bulwarks are riveted. The hatchways and the tieplates in the center of the deck are also shown.

The other view of the yacht shows her on the stocks, partly plated and surrounded by the numerous scaffold poles supporting the scaffolds from which the work on the exterior of the hull is done. The upper strakes of plating, up to the deck, and the bulwarks, are not yet in place, the deck beams being still visible. The height of the main deck is indicated, the archboard showing above it at the stern. Alberta is 189ft. over all, 158ft. l.w.l., 22ft. beam and 10ft. draft, and is designed for a high speed for her type.

The fourth yacht, Idalia, is 172ft. over all, 140ft. l.w.l., 20ft. beam, and 9ft. draft. She is shown on the stocks, the hull entirely plated, but the bulwarks not yet in place, the main deck is indicated, while the height of the rail is indicated by the stem and archboard. The four are of steel throughout, and schooner-rigged.

Douglaston Y. C.

THE new house of the Douglaston Y. C., at Port Washington, will be formally placed in commission on Saturday, June 3. An unusually large attendance of members and their friends is expected, due to the club location on Manhasset Bay, which has been long known to the yachting fleet as one of the best harbors on the Sound.

The house, which is situated directly on the shore, fronts the entrance to the bay and was originally a private residence, but has been rebuilt to suit the requirements of the club. On the first floor is a café and dining room, with a locker room and a bicycle room in the

ALBERTA—DECK, LOOKING FORWARD.

VICTORIA AND ALBERT—THE NEW BRITISH ROYAL YACHT.

rear. The kitchen and steward's quarters are in a separate building, connected with the main house by a covered gangway. On the second floor is a large model or reception room and two ladies' rooms, the latter being entirely separated from the rest of the house. The third floor contains seven bedrooms. A long-distance telephone has been installed for the convenience of the members.

Directly in front of the house is a large timber basin, 200ft. square, in which the float stage is located and which will also be used as an anchorage for the smaller boats. On the piers forming the basin a pavilion 24x50ft. has been erected, the entire bay frontage of which is glass, arranged to open in fine weather and from which a view may be had of the entire bay. This pavilion will undoubtedly be found to be one of the best shore features of the club.

The North Shore Division of the Long Island Railroad, on which the club is situated, gives the best service on Long Island, which will be augmented by the addition of the new club Saturday express train, making its initial trip on the club's opening day. By this train it will be possible to reach Port Washington from foot of Chambers street, in one hour, while the club property is only a few minutes from the depot, stages meeting all trains. Ample stable accommodation is provided for members driving to the club.

The necessary legal arrangements required for change of name to Manhasset Bay Y. C. are now under way, but as this will require about two months to consummate, the club will remain as of old, until the application for change of name is granted by the court.

Quite a fleet of sailing dories has been purchased by the members, and races for this class will be held every Saturday during the season, with interclub matches with the Huguenot and other Sound clubs.

The officers of the club are: Com., Clay M. Green; Vice-Com., Hazen L. Hoyt; Rear-Com., W. G. Newman; Sec'y, E. M. MacLellan; Treas., Geo. A. Corry; Chairman Regatta Committee, Chas. P. Tower; Chairman of the House Committee, E. M. MacLellan.

New Rochelle Y. C. Special Race.

NEW ROCHELLE—LONG ISLAND SOUND.

Saturday, May 27.

THE New Rochelle Y. C. opened the season with a special race for yawls, knockabouts and catboats on May 27, the course being from off Premium Point around the buoy off Hen and Chickens Reef, around the middle ground buoy, off the end of Execution Reef, and to the line two rounds making eight and a half miles.

With a fresh S.W. breeze one and even two reefs were in order. The new Herreshoff "knockabout" Oiseau, owned by J. R. Maxwell, Jr., sailed her first race, being steered by J. Roger Maxwell, Sr. The times were:

Yawls—Start, 2:35 P. M.			
	Length.	Elapsed.	Corrected.
Veery, H. S. Gibson.....	36.00	1 19 28	1 19 28
Possum, W. N. Bavier.....	33.11	1 24 16	1 22 05
Twilight, E. Lambden.....	30.98	Not timed.	
Addie, W. L. Diaz.....	27.40	1 49 00	1 42 33
Cabin Cats—Start, 2:40 P. M.			
Osage, O. H. Chellborg.....	23.50	Withdraw.	
Win or Lose, J. S. Appleby.....	23.40	4 23 39	1 43 39
Twenty-five-foot Class, Knockabouts—Start, 2:45 P. M.			
Oiseau, J. R. Maxwell.....	25.00	4 06 26	1 21 22
Alyce, W. Hennen.....	25.00	4 20 50	1 35 50
Knockabouts—21ft. Class, Start, 2:50.			
Mongoose II., Simeon Ford.....	21.00	4 18 35	1 28 35
Kantaka, G. J. Bradish.....	21.00	4 21 59	1 31 59
Spindrift, S. C. Pirie.....	21.00	4 18 09	1 28 09
Seawanhaka—21ft. Racing Length.			
Thelga, A. P. Thayer.....	21.00	4 32 35	1 42 35

The winners were Veery, Win or Lose, Oiseau, Spindrift and Thelga.

Columbia and Defender.

THE new steel mast of Defender was stepped on May 24, being taken from the shops by the steam lighter Archer and carried to the yacht as she lay at anchor off the works. As soon as it was in place, the shrouds were set up, and the work of rigging and fitting out has gone on steadily ever since. Before leaving the shop, the mast was weighted, with the standing rigging on; the weight being 6,229lbs. It is painted to represent wood, and might easily pass for wood now that it is in place.

Though the date of the launch of Columbia has been given positively as June 8, there is no proof that this is authentic or that the progress of the work may not necessitate a change. Many workmen are now busy on the yacht, finishing the work of riveting and caulking, lay-

ing the deck, polishing the bottom, and sheathing the lead keel with bronze plates, about $\frac{1}{8}$ in. thick, as in Defender. The rudder is not yet shipped, but the bobstay plate is in place, about the fore end of the waterline. While the yacht is very nearly ready for launching, none but her builders know of the exact date, though the tide tables indicate about June 8.

There has been some uncertainty as to Mr. Iselin's position in relation to Columbia, it is known that he is to all intent her owner during the races, and will have entire control of her as such, but it has been understood that Com. Morgan is the sole legal owner. Within the past week it has become known that Mr. Iselin is associated with Com. Morgan in the ownership of Columbia, his interest being stated at some \$20,000.

Royal Canadian Y. C. Skiff Races.

TORONTO—TORONTO BAY.

Wednesday, May 24.

THE Royal Canadian Y. C. celebrated the Queen's Birthday, May 24, with a race for the 18, 16 and 15ft. classes of skiffs, sailed in a light S.E. breeze. The times were:

15ft. Class—Start, 2:20.		
	Finish.	Elapsed.
Sigma, R. T. Cuff.....	4 21 30	2 01 30
Tortoise, H. W. Parsons.....	4 27 35	2 07 35
Aro, H. L. Strange.....	4 32 09	2 12 09
Hilaria, C. W. Wilson.....	4 33 00	2 13 00
May Fly, R. L. Lessel.....	4 43 00	2 23 00
Marie, W. J. Griffiths.....	4 45 55	2 25 55
16ft. Class—Start, 2:10.		
Unknown, R. Osborne.....	4 11 45	2 01 45
Unnamed, Wedd & Darrell.....	4 15 00	2 05 00
Caprice, R. Slee.....	4 16 45	2 03 45
Roxane, F. Childs.....	4 19 39	2 09 39
Spray, Hales & Underwood.....	4 21 54	2 11 54
18ft. Class—Start, 2:00.		
Nereid, Craig & Greig.....	Did not finish.	

Caprice protested Unknown for an alleged fouling.

Inter-Lake Regatta.

PITTSBURG, Pa., May 23.—A meeting of the Inter-Lake Yachting Association was held at the headquarters of the Cleveland Y. C. Saturday evening, May 20. It was determined to hold the annual regatta at Put-in-Bay, Aug. 7 to 11, inclusive, this change being made to permit the Lake Michigan yachtsmen to join.

This meet promises to be the largest yet held by the Inter-Lake Yachting Association. The entertainment committee are making special efforts to make it a memorable one, and promise some unique features, and a better time than ever before.

The race committee will have their report ready at an early day. The programme will be a large and attractive one, a large amount being put up in purses and prizes than usual.

LEONARD D. DAVIS, Sec'y.

YACHTING NEWS NOTES.

THE year book of the Yacht Racing Association of Massachusetts, just published under the editorship of Sec'y A. T. Bliss, is one of the most artistic books of the class we have yet met with, including many good photos of yachts and bound in an attractive blue cloth cover. The book contains all of the new rules of the Association, with list of officers, etc. The Association now includes thirty-two clubs from the vicinity of Boston, with twenty-four open races scheduled. The prospects for the fourth season are most encouraging.

The racing rules of the Yacht Racing Association of Long Island Sound have just been published, uniform with the books of previous years, but considerably larger by virtue of the additions made last winter. The Association now numbers twenty-one clubs, covering the west end of Long Island Sound from Sachem's Head to Hell Gate, with twenty-eight races scheduled. Copies of the book may be had of the printers, Thompson & Co., No. 9 Murray street, New York. Price, 25 cents.

Manning's Yacht Register for 1899, the twenty-fifth year of publication, has appeared within the past week, in time for Decoration Day. The book is in two large volumes, one containing the yacht register and the other the record of races for 1898 in the United States, Canada and Nova Scotia. The list includes 2,041 sailing and 444 steam yachts. The list of yacht clubs reaches a total of 155.

Bonnie Bairn, naphtha auxiliary, designed by C. G. Davis and built by Samuel Ayres & Son at Nyack for Malcolm Graham, Jr., was launched on May 22.

Jule, steam yacht, designed and built by the Fall River Iron Works, for B. P. Cheney, the husband of Julia Arthur, was launched at East Braintree, Mass., on May 24. She is 57ft. over all, 12ft. 6in. beam, and is expected to make 11 knots.

When work was first begun on the new house of the New York Y. C. on Forty-fourth street, it was expected that it would be completed before the America's Cup races in October. This has been found to be impossible, and the present house will be used for the balance of the year.

Aphrodite, steam yacht, Col. O. H. Payne, is still at South Brooklyn, the interior furnishings being put in. Last week the work was stopped by a strike of the members of the Amalgamated Society of Painters and Decorators of New York, twenty of whom were employed.

Nahma, steam yacht, arrived at Newport on May 25 from Naples, via Genoa, with the body of her late owner, Robert Goelet, on board. The yacht proceeded to New York, where the funeral took place on May 27, at Woodlawn Cemetery.

The new steam yacht Kananha II., designed and built by C. L. Seabury & Co., for John P. Duncan, was launched on May 27 at the works of the Gas Engine & Power Co. and C. L. Seabury & Co., Morris Docks, New York. The yacht is of steel and schooner-rigged, her dimensions being: Length over all, 227ft.; l.w.l., 192ft.; beam, 24ft.; draft, 10ft., and depth, 15ft.

Rifle Range and Gallery.

Sept. 4.—Sea Girt, N. J.—Meeting of the New Jersey State Rifle Association. De Lancy G. Walker, Sec'y.

Sport in ye Olden Time.

GETTYSBURG, Pa.—Editor *Forest and Stream*: Inclosed you will find a notice to marksmen for a shooting match held April 17, 1829. First prize, a bear and second prize a deer.

This tavern was about seven miles northwest of Gettysburg, Pa., on the old Mummasburg Pike, and about one mile from the mountains. At that time bear were plenty in the South mountains, but have been extinct for a quarter of a century. Deer were also very plenty, but at this writing have nearly all disappeared. I spent one week this last winter hunting, and did not get a glimpse of one. Rifle shooting has always been a practice for the winter months in the vicinity of Casletown, Pa., Every Saturday afternoon they will gather at some house for a match, the prizes being hogs or turkeys, and the old muzzle-loading rifle is still used.

F. MARK BREAM.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

June 3.—New Haven, Conn.—Yale vs. Princeton.
June 3-4.—Sheboygan, Wis.—Sheboygan Rod and Gun Club's tournament.
June 3-4.—Elgin, Ill.—Target tournament of the Elgin National Gun Club. C. E. Middleton, Sec'y.
June 5-10.—Buffalo, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Gun Club; \$1,000 guaranteed; over \$2,000 in merchandise, and \$1,000 added money in open events. Chas. Bamberg, Sec'y, 51 Edna Place.
June 6-9.—Sioux City, Ia.—Fifth annual amateur tournament of the Soo Gun Club. E. R. Chapman, Sec'y.
June 7-8.—Crawfordsville, Ind.—Indiana Trap-Shooters' League tournament, under auspices of Crawfordsville Gun Club.
June 10.—Princeton, N. J.—Yale vs. Princeton.
June 13-14.—Grand Forks, N. D.—Fifth annual shoot of the North Dakota Association.
June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.
June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

ment, under auspices of the Providence Gun Club. R. C. Root,
Sec'y.
Aug. 9-10.—Portland, Me.—Interstate Association's tournament,
under auspices of the Portland Gun Club. S. B. Adams, Sec'y.
Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate As-
sociation, under auspices of the Portsmouth Gun Club. W. N.
White, Sec'y.
Oct. 6-7.—Pawling, N. Y.—Tournament of Pawling Rod and Gun
Club; targets and live birds.
First and third Fridays of each month.—Watson's Park, Burn-
side, Ill.—Semi-monthly contest for Montgomery Ward & Co.'s
diamond badges.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in
these columns, also any news notes they may care to have printed. Ties
on all events are considered as divided unless otherwise reported. Mail
all such matter to Forest and Stream Publishing Company, 346 Broad-
way, New York.

On May 22, at Watson's Park, Burnside Crossing, Ill., Messrs.
O Von Lengerke and W. H. Dupee shot two matches at 100
birds. In the first, Von Lengerke made the excellent score of
93; Dupee, 77, with 4 birds allowed and added, 81. In the second
match Dupee was allowed 8 birds added to his score, but he did
not need them, as this time he beat his man out by the score of
88 to 85. With his added birds he scored 96. The birds were a
strong lot, and there was a high right-quartering wind.

Mr. Edward Banks and wife left New York last week, Thursday,
for Buffalo, to meet his sister and brother-in-law, who are leis-
urely en route from India to England. It is many years since
they have seen each other. The party will return to New York
some day this week, and two or three days will be devoted to
sight-seeing before the journey is resumed.

Mahanoy City, Pa., was fixed upon by the County League of
Game and Fish Protective Associations for its fall shoot. The
Pine Grove Game and Fish Protective Association and the Hegins
Shooting and Fishing Association were admitted to membership
at the League meeting on May 24, at Llewellyn. The Tremont
team captured the Peters trophy in the contest for it.

In respect to transportation, arrangements have been made in
favor of those attending the New York State Shoot, whereby all
roads entering Buffalo have conceded a special rate of one and
one-third fare on the certificate plan. Tickets can be purchased
at full fare going and one-third fare returning. Be sure to ask
for certificate when purchasing tickets.

On Wednesday of last week Mr. T. W. Morfe again got pos-
session of the E. C. cup, emblematic of the championship of
New Jersey, defeating Phil Daly, Jr., by a score of 43 to 36. The
winner was challenged by Mr. W. H. Huck, of Rutherford, N. J.,
and the contest will be in June, at a date to be fixed upon soon.

Mr. John Wright, manager of the Brooklyn Gun Club, con-
templates giving a weekly trophy of some kind, to be contested for
during the season. Thus he will have a special weekly induc-
ement for the shooters as well as the Francotte gun prize, the lat-
ter a monthly contest.

The Bergen County Gun Club will hold an all-day target tour-
nament on June 17, for amateur contestants, on its grounds at Hack-
ensack, N. J. Programmes will be ready for distribution in a
few days. C. O. Gardner, secretary.

The Oceanic Gun Club trapped about 14,000 targets during its
season, just closed, of which C. F. Dudley purchased 1,125, of
which he broke 844, and D. L. H. Bill (Schortemeier) purchased
1,440 and broke 1,053.

Mr. C. C. Chase, of Oshkosh, Wis., informs us that the Winne-
bago Gun Club will hold a shoot on July 8 and 9. Programmes
will be ready for distribution after June 15. Oscar D. Cray, Jr.,
is secretary.

Owing to the observance of Decoration Day, this issue goes
to press a day earlier than usual, and much new matter which
otherwise would have appeared, has of necessity been put over.

Mr. Paul North will be in charge of the grounds at the New
York State Shoot, which takes place at Buffalo next week.

Motto for the shooters who may be en route anywhere next
week—"Let me off at Buffalo."

BERNARD WATERS.

WESTERN TRAPS.

Eureka Gun Club.

CHICAGO, Ill., May 27.—The country about Eureka Gun Club
grounds, at Seventy-ninth street and Vincennes avenue, looked
very sweet and fresh and green this afternoon, and a good number
of the club members gathered to take advantage of the pleasant
weather. There were three squads, with something to spare most
of the time, and the sport was kept up until after 5 o'clock. The
Class A trophy was won by W. D. Stannard, 25 straight. Dr. Mil-
ler won Class B trophy on 19, J. L. Jones Class C trophy with
16, and Mrs. Dr. Carson the Class D trophy with 17, the latter

shooting also with equal success in some of the sweeps which
followed the regular events.

Among others present were Mr. E. H. Ford, of the new Velox
smokeless powder, the latest nitro to claim the attention of the
trap shooters. Jack Fanning, of the Gold Dust, was also on hand
on his way East from the Iowa shoot. The afternoon shoot was
pleasant in every particular. The following are the scores:

Von Lengerke-Dupee.

On last Monday Messrs. Oswald von Lengerke and Walter
Dupee met to settle their postponed race at 100 live birds at
Watson's and before they got done they had shot two races, one
in the morning and one in the afternoon, and honors remained
easy for the day, although Mr. Von Lengerke won the race at
the earlier contest between these two gentlemen. Mr. Von Lon-
gerke gave Mr. Dupee a mark of 27yds. and 4 birds added to
his score, he himself standing at 30yds. In the first race, in the
morning, there was strong wind to the right quarter, and the
birds were prompt; only 2 were flagged. Both men shot along
in good shape indeed, Mr. Von Lengerke making the fine score
of 93, easily distancing his competitor, who retired with 81.

Mr. Dupee shot a plucky race, although his gun was pound-
ing his cheek badly. Young, and of very slight physique, Mr.
Dupee none the less does a great deal of shooting, and can
stand a long race far better than one would suppose. He seemed
at least to have confidence in his own ability to repeat, and he
challenged Mr. Von Lengerke to shoot the race over again, this
time to give him 8 birds added to his score. This looked easy
enough on the basis of the earlier race, but did not prove so
in the event, Mr. Dupee beating his man even without the
handicap. Mr. Von Lengerke was troubled with a bad headache
and appeared more tired than his youthful rival. He saved him-
self all he could by the use of the first barrel, but did not finish
quite as strong as Mr. Dupee, who was fresh as paint. The latter
shot his Purdy gun with 24in. trap, 3/4 Schultz powder. Mr.
Von Lengerke used his Francotte gun, the same powder in trap
and leader shell, both shooting No. 7 shot. In the second race
both used smokeless cases, and Mr. Von Lengerke, having a gun
with a long chamber, could not find at the grounds just the load

he wished, neither man having come prepared for the second
race. The following are the scores:

480 CAXTON BUILDING, Chicago, Ill.

E. HOUGH.

Eureka Gun Club.

Chicago, Ill., May 20.—The day was anything but favorable for
target shooting, it being dark and the wind blew very hard. It
was cold enough for winter clothes, but with a good fire in the
club house and plenty of shooting at the traps the Eureka Gun
Club members enjoyed a pleasant afternoon. Some very good
scores were made considering the weather. All of the events were
shot over the magautrap, excepting the Mussey cup event, which
was shot over five traps, one man up.

In the preliminary event at 25 targets, the scores were: Mack
18, Morgan 20, Mrs. Carson 11, Cunningham 23, Matthews 20,
A. W. Adams 17, Lovell 16, Cornwall 16, P. Adams 11, Dr. Miller
17, E. Adams 17, F. P. Stannard 19, J. L. Jones 15, W. D. Stan-
nard 19.

The trophy event was at 25 targets, and resulted as follows:	
R B Mack.....	0010111010011001000011-12
H B Morgan.....	1110110011001101111000-17

NOTICE.

THE New York Clearing House has adopted new regulations
governing the collection of checks and drafts on banks outside of
the city. This entails a collection expense on those who receive
such checks. Our patrons are requested, therefore, in making
their remittances to send postal or express money order, postage
stamps, or check or draft on a New York city bank, or other New
York current funds.

The FOREST AND STREAM is the recognized medium of entertain-
ment, instruction and information between American sportsmen.
The editors invite communications on the subjects to which its
pages are devoted. Anonymous communications will not be re-
garded. While it is intended to give wide latitude in discussion
of current topics, the editors are not responsible for the views of
correspondents.

Subscriptions may begin at any time. Terms: For single
copies, \$4 per year, \$2 for six months. For club rates and full
particulars respecting subscriptions, see prospectus on page iv.

The FOREST AND STREAM is put to press each week on Tuesday.
Correspondence intended for publication should reach us at the
latest by Monday and as much earlier as practicable.

IN NEW JERSEY.

Jeannette Gun Club.

New York, May 19.—The Jeannette Gun Club held their monthly shoot on the grounds of J. H. Outwater's Riverside Hotel, Hackensack Plank road, N. J. The first squad was greeted by a heavy shower. It lasted only a short time.

L. H. Schortemeier again won the Class A medal for the third time from the 33yd. mark, and it now becomes his personal property, shooting U. M. C. Co. factory-loaded ammunition, E. C. & Schultze powder, 1 1/2 oz. No. 7, Trap cases.

J. Bohling, Jr., won the Class B medal for the second time and the gold medal offered by Mr. F. Ehlen for the most number of kills in the last six months for good. H. P. Fessenden, referee; A. Schubel, trap puller; J. Jones, scorer.

JOHNNY JONES.

Championship of New Jersey—E. C. Cup Contest.

May 24.—The contest for the championship of New Jersey and the E. C. cup, which represents it, took place at Elkwood Park to-day between Mr. Philip Daly, Jr., the holder, and Mr. T. W. Morley, the challenger. The weather was clear and pleasant. A stiff wind blowing straight in the faces of the shooters, as they stood at the score made very difficult shooting. Morley was shooting in fine form, while Daly was shooting much below his ordinary ability. Many of the targets were "dusted." Morley shot in much the quicker time, which was an advantage under the existing condition of wind, flights, etc. The scores were: Morley 43, Daly 36.

Mr. Al Ivans was referee. Messrs. Hobart and Waters were judges.

East Side Gun Club.

Newark, N. J., May 25.—The wind blew stiffly from right to left across the traps at the East Side Gun Club's live-bird shoot to-day. No. 1 was at 7 birds, \$3, three moneys, Rose system; No. 2 was the club shoot, and the points precede the scores.

Afterward three miss-and-outs were shot, \$1 entrance, starting at 28yds. and one yard back to 33. There were seven competitors, Koegel winning in the fourth round in No. 1; Schortemeier and Moffett in the sixth round in No. 2, and Koegel and Percy in the sixth round in No. 3.

* Guests.

Central New Jersey League.

New Brunswick, N. J., May 27.—There was a strong wind and the targets were far from easy. The conditions were five-men teams, each man to shoot at 25 targets. There were three teams, a fourth and fifth contesting on a prospective membership, but as they were not elected till after the shoot on account of the late arrival of other members, their scores did not count. Their scores were: Columbia Gun Club, of Perth Amboy—De Worth 11, T. Bloodgood 12, Disbrow 15, H. B. Bloodgood 12, Little Jim 13—63.

Brunswick, of New Brunswick—Capt. Bunk 19, Voorhies 14, Erwin 14, Sperling 15, Oakley 18—80.

The regular team contests were between the Reservoir Gun Club, of New Brunswick; the Dunellen Gun Club, the Climax Gun Club, of Plainfield, and the Brunswick, of New Brunswick.

Reservoir Gun Club—McDowell 20, Strong 15, L. Belloff 18, Carpenter 9, J. Belloff 17—79.

Climax, of Plainfield—Goodman 18, Hobart 16, Keller, Jr. 13, Arthur 12, Allen 19—78.

Dunellen Gun Club—Vandermer 19, Runyon 15, Giles 17, Fletcher 17, Hoey 14—82.

A few sweepstakes were also shot. The background was not favorable to good scores.

Buffalo Audubon Club.

BUFFALO, N. Y., May 27.—Since the programme for the New York State Shoot went to press the Buffalo Audubon Club has secured a fine horse valued at \$200 and a harness valued at \$50, which will be added to third prize in the Buffalo Audubon Club event (open handicap) on the fourth day.

Just think of it. Every trap shooter in America has a chance of competing on an equal footing in this event for prizes as follows: Horse, harness and bike wagon, value \$400; upright Shoninger piano, \$350; building lot, \$300; Domestic sewing machine, \$65; round-trip ticket to Duluth, \$30; suit of clothes to order, \$25.

BUFFALO AUDUBON CLUB.

ON LONG ISLAND.

Hell Gate Gun Club.

Brooklyn, L. I., May 24.—Eugene Doeinck, James Quinn, Emil Steffens and Emil Marquardt, in a field of thirty-six shooters, killed 9 each at the monthly live-bird shoot of the Hell Gate Gun Club, at Dexter Park to-day. Doeinck and Quinn did kill all their birds, but each lost one dead out of bounds. Scores:

Brooklyn Gun Club.

Brooklyn, L. I., May 27.—There was a good attendance of shooters at John Wright's weekly shoot to-day. He had several desirable prizes, one of which was a gun case, contested for in No. 5 event; the other a box of cigars, and was the feature of No. 7. No. 8 was the shoot-off of the latter. Each event was a handicap. The scores and handicaps in No. 5 were: F. A. Thompson, 4, 22; Waters, 6, 19; Brinton, 7, 21; Wright, 9, 10; Bramwell, 7, 18; Rensen, 2, 21; Hagedorn, 5, 14; Hopkins, 4, 23; Kemble, 4, 19; Bennett, 7, 15. In the shoot-off of No. 5 the handicaps were changed somewhat; handicaps and scores in the shoot-off were: Hopkins, 4, 18; F. A. Thompson, 4, 20; Waters, 4, 21; Brinton, 7, 14; Paterson, 9, 12.

Pawtuxet Gun Club.

PAWTUXET, R. I., May 20.—The scores of the challenge match for cast-iron trophy were:

W Thoen.....111111011111010111-17	
A Hawkins.....000110110101110111-13	

Quite a number of the lovers of the shotgun gathered at the regular fortnightly shoot of the Pawtuxet Gun Club, among the visitors being Mr. North, of the Cleveland Target Co., who happened to be in Providence on a business trip, and it was perhaps fortunate for us that he was, as we had the first little hitch with the magatrap that we have had in two years. He straightened it out all right in a jiffy. Mr. North also had a chance to try the tautog fishing in the bay, which he improved by catching not only the largest, but also the smallest fish in the party. The trip was organized by Treasurer Root, and the secretary also had a chance to go. Perhaps Mr. North can explain why he didn't.

We also had quite a delegation present from the Centerdale Club, Secretary Reiner, Harry Swindell, Sweet and Naylor being present. All of the events were optional sweeps except the sixth, which was also the regular club badge shoot. Hugh Bain won first class badge with the score of 23, and Mooney the second class with 19. The cast-iron trophy shoot was won by W. Thoen, who has been challenged by Repeater, the shoot taking place next Saturday. This is shot for from one bluerock trap, trap and handle for each other. All the other shooting was from the magatrap, which worked finely as usual.

DUSTER.

White Plains Shoot.

WHITE PLAINS, N. Y., May 25.—The two days' tournament of the White Plains Gun Club, under management of Geo. Molenaar, drew all that could be desired in fair skies and gentle zephyrs, but few shooters turned out on the first day. Although advertised to begin at 10 A. M. sharp, the first event started at 2:30 P. M., with seven entries. The new grounds are a decided improvement on those formerly used by Molenaar, and were in good order. One of the pleasant features of the day was the shooting of Miss M. E. Hyland, of Tarrytown. She shot in quick form, centering her targets beautifully and grinding them to dust. Her position at the score is perfect. This young lady should soon be in the first rank of target breakers, and I regard her as a strong opponent in her present form. Mr. W. Verplank filled the office of cashier and entry clerk very satisfactorily.

E. G. HORTON.

Sioux City Programme.

The programme that the Soo Gun Club has arranged for its fifth annual tournament, June 6 to 9, is just such that should please the average amateur, consisting chiefly of short events. The programme is precisely the same for the first three days, on which there will be 15-target events, \$1.50 entrance, or \$15 per day. The fourth and final day there will be but seven events. Nos. 1, 3 and 5 will be 15 targets; Nos. 2, 4 and 6, 20 targets. Though No. 4 is a two-men team race, teams can comprise any two men on the grounds. No. 7, the last event of the day and shoot, will be 50 targets. The purse in this is divided into five equal moneys.

On the first three days there will be \$100 average money each day, divided into ten averages of \$10 each. This will go to the ten high averages. Then there are also five special merchandise prizes, which go to the five low averages on each of these days. The purse in all events, unless otherwise stated, will be divided four moneys, 35, 30, 20 and 15. On the last day the club will add 10 per cent. of the net purse to each. This I infer to mean target money. Event No. 7 on the second day will be the cup event. This cup will go to the high gun, and winner may hold the cup until the next annual tournament, when the club will redeem the same at \$50. Ten dollars each will be paid to the next three high guns, who remain longest in the shoot-off.

Fred Gilbert very generously permitted Sheldon to take the Smith

A Trout Preserve offering many attractions is advertised in our list of properties for sale. This opportunity for a club here offered is of unusual character.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, JUNE 10, 1899.

VOL. LII.—No. 28.
No. 246 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

"Pack and be out of this forthwith!
D'you know you have no business here?"
"No; we haint got," said Samuel Smith,
"No business to be anywhere."
So wearily they went away;
Yet soon were camped in t'other lane;
And soon they laughed as wild and gay,
And soon the kettle boiled again.
Rhymes of the Gypsies.

EXTERMINATORY PEREGRINATORS.

WHATEVER may be thought of non-resident shooting restrictions, we must all rejoice at the adoption of repressive laws designed to reach individuals of the type described by our Florida correspondent, Didymus, in his comments upon what he aptly terms the "exterminatory peregrinations" of one class of traveling game destroyers. It is manifest, however, that to effect a cure of this "thirst for 'gator blood," this mania for inhuman butchery of living creatures whether game or not, we must have recourse to something more reaching than non-resident legislation. Enjoyment of indiscriminate torture of animal life finds its instigation in a depraved nature. The real cure for it is to be found in humane education, not in game laws. We must begin with the training of the child, not wait for the reform of the man. It is a question of the heart, not of the trigger finger.

There is nothing antagonistic between humanity and sport, between humane instincts with their promptings and the impulses and practices of field sports. While in specific cases it may not always be practicable to draw the precise line where humanity leaves off and cruelty begins, the distinction is one which is real, and is readily recognized in the consciousness of every right-minded person of mature years. One may be a humane man and yet a sportsman; nay, the sportsman is a humane man. What is a sportsman, the "true" sportsman? That is a question we have been threshing over for these many years. May we not say at least, as for our ideal type, that he must possess with other attributes of manhood the quality of mercy which "is not strain'd"; that he must have an ear and an eye for

All sweet sounds and all sweet things,
Whatever shines, whatever sings;

that in short he must see in the wild creatures which are put on this earth to inhabit it with him something more than mere bundles of flesh and bone and muscles and nerves, to writhe and squirm and twist when wounded by his ammunition?

Our correspondent does well to disclaim any purpose of confounding the average sportsman who visits Florida with the mere game butcher. It would be a gross wrong put upon hundreds and thousands of sportsmen who have found their way to that State, to charge them with the spirit of cruelty and its practice as illustrated in certain isolated individual cases. The great majority of us who take our guns and rods to Florida or Michigan or elsewhere feel the same indignation as that expressed by Didymus whenever we discover that the excesses committed by the few are mistakenly accepted as characteristic of the many; that the game butchers are looked upon as in any degree representative of the great guild of sportsmen. There could not be a grosser error. As we have pointed out before, the difference between the moderate shooter and the exterminatory peregrinator—if Didymus will permit us—who is consumed with an inordinate thirst for blood and impelled by a mad craze to pile up the count of fish and game, and of creatures not game, slain by him, is the difference between the rational and the insane. The typical sportsman of this country is not a peripatetic bloody-bones crazed by lust of blood.

THE PASSING OF SPRING.

It is only a little while since all the grass we saw was the dead, dun herbage of last year, and all the leafage the dark verdure of the evergreens looking as old as the trees themselves, and the nearest semblance to a bird song that greeted our ears was the drumming of the woodpecker. Now meadows and pastures unfold their living green far around us, and woods are full clad in fresh, new leafage, and many spring flowers are bygone, and the air is vibrant with the songs of summer residents and the notes of many migrants have drifted past to be heard no more for months. It is all more like the dim memory of those unhappened things which we call dreams than a recorded reality. Yet so it is and has been.

Under the green grass the last year's aftermath is barely hidden. The misty globes of the dandelion are like bubbles on the rippled green; the withered blossoms of elm and maple clog the rivulets the passing shower makes; dots of tenderest green show on the tips of evergreens; children gather the first buttercups and grope for the earliest strawberry; the songs of the robins are changed to notes of anxiety over their callow broods; the hammock of the oriole is swung on the elm branch; in the wide ramage of the butternut the cuckoo blows his flute to tell that all the summer birds have come, and as he skulks in the thickening copses the catbird mocks them all.

It is but a little while since the angler was weary with waiting for iceless streams, yet even now he counts many a goodly catch, and his nerves tingle yet with recent victories. As he steals upon the pools of the embowered brook he is startled by a fluttering grouse and her vanishing brood of downy chicks. Perhaps it seems long to wait until these mites that a wild ginger leaf now will cover, shall be fair prey to the gun, where only the quickest eye shall follow their hurtling flight and the readiest hand serve to stop it. But he will not have to wait longer than he has for the bass, for as swiftly as the spring has gone, so the summer will go, marking its passage with earliest fruitage and latest bloom, linking its last days to glorious autumn with blossoms of golden-rod and aster and gentian.

Why not enjoy the present that so swiftly passes? Why long for the future that so swiftly comes?

SNAP SHOTS.

The fishing letters which are printed from week to week in our angling columns show that the season of 1899 is to be counted, as Mr. Chambers puts it, a banner year for fish. The good word comes not from any one section alone, but from many; even Fred Mather out in Wisconsin is so busy fishing that he cannot make time to write about it. For everyone but the unfortunate who is "chained to business," with the padlock key thrown down the well, these rosy reports of trout galore make the most acceptable kind of reading. The opportunity should be improved by those who can get away, and here is a wish of good luck to every happy angler.

That is a very interesting case which is reported this week from Pennsylvania, as having to do with the right of fishing in posted streams. As a matter of fact, the principle enunciated by the court is so well established and so familiar that the finding of the jury was precisely what would have been expected. This principle is in effect that a stream is the exclusive privilege of the owner or owners, or those who lease it, whether the control be in the hands of a single individual, of a number of owners of adjoining lands or of a corporation owning or leasing the stream; and that the exclusive privilege extends throughout the entire course of the stream which is thus controlled, whether it be for a hundred feet or for miles. This is, as we have said, a familiar principle, but the peculiar circumstance of the case determined in Pennsylvania was that there exists there a prevailing popular sentiment questioning the right of stream owners to forbid outsiders from trespassing for fishing. The feeling was so strong that certain of the defendants, as they testified, had been advised by lawyers that they might fish in the posted streams with impunity. The ground for the opinion appears to have been the fact that the waters had been stocked by the State. In some States provision is made in the statutes that waters so stocked at the public expense must be kept open for public use.

This problem of protected streams is one of growing magnitude in Pennsylvania, where each year sees a decrease in the number of waters open to the public. The expedient of leasing and protecting and shutting out others from the fishing is continually resorted to by those who seek in this way to insure good fishing for themselves, until it has become a puzzling question in Pennsylvania where one may go without being confronted by a trespass notice. Many thoughtful anglers, who cannot be accused of harboring any disregard for the law or the legal rights of their fellows, declare that such posting of streams has gone to an extent beyond public interest. They ask with alarm what is to become of the unattached angler, the town dweller who must depend for his fishing on open streams. The problem is one which is likely to find its own solution. We can hardly hope for a change of public sentiment which will make those who are not directly concerned with fishing sensitive as to the preservation of fish; and under these conditions it will be left for the fisherman himself to restock, preserve and defend his fishing right. In Pennsylvania as elsewhere the fishing of the future will be done for the most part in streams which are maintained and controlled by private enterprise.

We again invite attention to Mr. T. S. Palmer's paper on the introduction of exotic species of animal life. Mr. Palmer has brought together a vast collection of facts which are instructive and full of warning. The conclusions drawn by him from the evidence here produced will form the subject of the concluding portion of his paper to be given in our next issue. In collecting this material and putting it into shape for such clear presentation to the public, Mr. Palmer has done a valuable service.

The New York Fisheries, Game and Forest Commission has performed a useful work by supplying for distribution cloth posters calling attention to the penalty for killing song birds or injuring their nests. The posters will be sent on application. They should be tacked up in the village post-office and at the cross-roads and four-corners. The Commission may be addressed at Albany.

The biggest thing yet in the way of game and fish preserve projects is the one reported in our angling columns to fence in the Lake St. John district and adjoining territory in the Province of Quebec for a private preserve of thousands of square miles. The scheme at first sight appears a bit top-heavy, but the fence will stand up if the posts are set closely enough together and the trees don't fall on them.

As a pleasing supplement to the story of the expedition among the Florida Seminoles told last week by Mrs. J. M. Willson, Jr., we find in the Valley Gazette of Kissimmee note of a visit paid by the Chiefs Tallahassee and Billy Bowlegs to the Willsons there. Mr. Willson is secretary of the Friends of the Florida Seminoles, an association of those who are interested in securing to the Indians a reservation in the Everglades, of which they shall enjoy permanent tenure, and in advancing the social condition of the tribe. Tallahassee is now eighty years old, and he came up from Indian Town costumed in the full regalia of his rank. It is interesting to note how these Florida Indians have preserved in a wonderful degree the manners and customs of the Southern tribes as first known to the discoverers. Old Tallahassee's turban, for instance, might have been one of those shown in the delineations of Florida life in 1563 by the French artist Le Moyne.

More suggestive than this is a fact which is recorded by Mrs. Willson in the "Indian Friend." At a Fourth of July celebration at Im-mo-kah-lee, on the western edge of the Everglades, when Rt. Rev. Wm. Crane Gray was present, he recognized, as the Indians chanted a hymn in their native tongue, in the Seminole word Yah-vet the Hebrew Jehovah or Jehovah. From the use of this word in the depths of the Everglades, as Mrs. Willson suggests, one may work back to the prehistoric ruined temples of Mexico and Yucatan, so similar to those of Egypt; and thus may find in Seminole speech a language link to connect the new word with the old.

The Sportsman Tourist.

Pioneer Days.—II.

BY ROWLAND E. ROBINSON.

JOSIAH HILL was up betimes next morning and presently engaged in preparations for his suddenly conceived plan of departure. The £10 were paid down, the deed acknowledged and in his possession, and Anthony Capron mounted his horse and rode away southward with a self-satisfied smile on his sanctimonious face. The Allen brothers rode northward on the way to their extensive purchases in the Grants, with which their fortunes were henceforth to be so intimately connected.

Josiah owned a yoke of oxen and a new cart, with which the journey was to be made, and it was now loaded with a barrel of pork and another of corn meal, blankets and bed quilts, his own and the hunter's guns and traps, axes, a kettle and frying-pan, and such indispensable articles of backwoods life. There was also a bountiful supply of cooked provisions for the long journey—loaves of rye and Indian bread, baked pork and beans and a bag of New England's staple luncheon, the well-beloved doughnut, whereof they were to see no more for many a month.

By the middle of the forenoon they were ready to set forth, good-byes were said, and with an interested audience of the greater part of the hamlet's population, they began the long, slow journey. The oxen swayed along the rough road; the cart creaked with jolting over it, and the two adventurers, seated on a board laid across the cart body, turned their backs on homes and friends. From the last hilltop of the valley they looked back on the smooth green fields, the snug homesteads, the winding river and its mills, the maple woodlands kindling with the first blaze of autumnal tints, and heaved a sigh of regret for all they were leaving behind.

Thus they passed out of Connecticut and into Massachusetts and across it, along traveled highways, through improved lands and by established homesteads, where shade trees of second growth shaded door-yard and well and roadside, and brooks babbled through broad meadows in unbroken sunshine, and cattle grazed in grassy pastures—so old that the stumps and debris of the former forest were no longer seen. Every few miles they came to some village on a stream, with its saw mill and grist mill, its store and blacksmith's and cooper's shops, its tavern, with its hospitable sign and inviting roadside nearness. There was the meeting house standing beside its increasing encampment of the dead—the green tents where the pioneers of the wilderness, the old Indian fighters and advance guard of the peaceful army of invasion slept the long, dreamless sleep, with many of the generation that came after them to reap where they had sown. Sometimes the travelers stopped for the night at a hospitable farm house, sometimes at a wayside inn—always welcome at either, with their budget of news from the lower country, which became fresher and rarer the further carried.

Gradually the oxen crept toward the verge of the forest and dragged the red cart into the broad belt of scattered new farms, separated by increasing miles of forests and stretches of road, always growing worse with deep ruts, quagmires and ruinous bridges. So they came to a fortified blockhouse, an outpost of the old frontier, and rude memorial of the days of constant peril and frequent alarm. They came to poorer nightly quarters in one-roomed log houses, and at last to camping in or under the body of the cart by outdoor fires, and so by degrees passed out of civilization into the wild, rude life of the pioneer.

Once in the dusk of nightfall they reached a straggling hamlet and were searching for its inn when the tired oxen started at some object near a house. Looking for the cause, the travelers saw a great panther standing on a cross piece at the top of a post and knew that this was the famous Catamount Tavern of Landlord Fay, at Bennington, the headquarters of the Green Mountain Boys, whose fame was already extending beyond the borders of the infant commonwealth. Great beams of light stretched out from the windows of the cheerful barroom athwart the road and faded out in the gloom of the opposite field, save where one maple's scarlet and yellow foliage caught the full glare and glowed like a tower of fire. A company of a dozen stalwart men were gathered, smoking, drinking and chatting, desisting a moment to regard the two travelers as they entered. Conspicuous among the company was the burly figure of Ethan Allen, standing with his back to the fireplace and discoursing loudly upon whatever topic came uppermost.

"Ah!" he cried, glaring at the newcomers as they conferred with Landlord Fay concerning the disposal of their team, "two more recruits for the army of the Lord. And where might you be bound, my friends?"

"As far as the Little Otter, nigh the lake," Dalrymple answered, setting his rifle with Josiah's in a corner, where they underwent inspection by many lovers of guns.

"That's right," said Allen. "Settle on the streams; they're the first paths of the wilderness, an open way summer and winter, and we want to head off the Yorkers on all of them. Stub and I and One-Eyed Tom, here," indicating a sedate gentleman, with a defective eye, who sat near him, "have kept that in mind, and we've made pitches twenty mile beyond you, on the Onion River. Perhaps we'll call some day as we are passing."

"You'll be welcome," said Kinelm and Josiah, in the same breath.

"You've taken your right under New Hampshire?" Allen asked, with a sudden searching look.

"In course I have," said Josiah. "I guess ev'rybody aour way does that."

"Mostly," said the other: "but there be some that prays to the good Lord and the good devil, not knowing which hands they'll fall into; but you stick to the Lord's side, my friend, an' you'll come out top. If the Yorkers trouble you, let us know. Give me your names, please."

He wrote them down, with the name and number of his location in a memorandum book, and turned away to confer with two men of very noticeable yet very different appearance—one of commanding mien and sta-

ture, a calm, thoughtful, resolute face, deliberate of movement; the other of medium height, but muscular mould, and firm-set features almost fierce in expression. The first was Seth Warner, the other Remember Baker, both kinsmen of the Allens and leaders in the opposition to New York claimants.

"Well, gentlemen," said Allen, taking up a candle and leading the way, "let us go and sit in the judgment seat." And therewith he and his colleagues left the barroom and could be heard tramping up the stairs and into the afterward famous council chamber, while Kinelm and Josiah were left to eat their "tuckernuck" supper, with only the hostler and a couple of mugs of flip for their company.

In those primitive times it was no offense to the innholder nor shame to the traveler to carry his own provisions and eat them by the barroom fire, and this was called "traveling tuckernuck," a name that smacks of Indian origin, as the custom does of the practice of the red wayfarer, whose sole dependence was on his bag of no-cake, a parched, pounded corn, and his hunk of dried venison, eked out by such game as he chanced to kill. Our travelers also adopted this plan a little later, when the old ranger would strike into the woods skirting the road and pick up a partridge or a wild pigeon.

Chat.

Editor Forest and Stream:

I don't remember how long ago it was, but so long that the thought of it makes me feel old, that I found myself in the company of a lot of old railroad conductors in a favorite resort where conviviality, congeniality and shop talk were the principal features of the meeting. In the company was a retired veteran from the Erie Railroad, an inimitable story teller with an inexhaustible fund of anecdotes, wit, and a habit of winding up his stories with the query, "What was it Susan B. Anthony said?" and whether it was Susan B. or Mark Antony, the invariable answer was, "It's a long time between drinks." Whereupon the party called for their favorite lemonade. All of which is a round-about way of saying that it's a long time since any screed of mine has occupied the valuable space of FOREST AND STREAM.

When congenial companions converse, time and words flow so smoothly that one is little apt to take heed of either, and the "wee sma' hours" sometimes finds tongues still wagging, and, if they are smokers, clouds still rolling, but when it comes to writing and one has to do all the talking, time and words must be considered, and the one who does it is puzzled for choice of subject that may be agreeable to the reader.

After reading the many good things in FOREST AND STREAM to-night, I feel like one who has shared, without contributing, the pleasures of congenial company, and the spirit moves me to say something. Whether my talk may have interest or not, it is an overflow of the feelings and must come forth.

Now, as to the word "sportsman," I don't know what we might substitute for one who loves to hunt or fish, but the word seems too broad. Nowadays anyone who carries a gun is called a sportsman. He may be anything else. I have seen men, and unfortunately been with some who carried the finest accoutrements, commanded the best dogs, and talked enthusiastically of game protection, whose whole ambition in the field seemed to be to carry home a full bag, and to accomplish that end they labored harder and showed more discontent over failure than they would in any day of successful or unsuccessful business at home. The ethics of the chase and the surroundings of nature had no interest for them whatever. At home these men were called sportsmen because they hunted. But I am glad to say that I know many more men whose dispositions are quite the reverse, and they are called sportsmen, too.

My hunting instinct was encouraged by a man who loved his gun and dog more than the game they brought him. It was his greatest pleasure to roam the woods, and I have seen him sit on a log watching a grouse scratching for its dinner, or a squirrel chattering its saucy defiance, while his eyes twinkled with the enjoyment of the scene and his gun lay across his knee without a thought of using it. I was a boy then, and the days were halcyon when my "Sam Lovel" permitted me to accompany him. What he did not know about the woods and the habits of his quarry was hardly worth knowing, and what enjoyment he did not get out of them was worth less. Why, he didn't care whether he came home with a backload of game or nothing at all. Frequently it was nothing, but I knew that if he wanted the backload he could get it.

He believed that a good man's reward is to return to earth and participate in all the enjoyments of life and wanted nothing better than he had here.

I am much interested in the recollections of other's good times afield or afloat. What a world of fun some of us have in our travels. May be not all fun, either. There are some disagreeable incidents that were better forgotten, but they all go to make up the pleasures, and, after all, one sometimes thinks of them in the light that they intensify the pleasures.

Once, while trout fishing on a favorite stream, I approached the head of a large, deep pool in which I knew there were some lordly fellows. A large tree lay across the stream, and as I lifted my foot to step over it I was greeted by the clatter of a rattler on the other side. While studying how I should get around, r-r-r-rattle on my right made me jump back, when r-r-r-rattle in the rear hurried me into the middle of the stream. I crawled under the log and got a ducking. When I arose I had the extreme pleasure of seeing the first rattler glide away into the bushes. That was one of the disagreeable incidents of trout fishing, but I look back to it with pleasure, for after my scare was over I hauled two fine trout out of the pool.

On another occasion, while sneaking along the bank of a trout stream in order to reach a favorite pool without jarring the bank, I was startled by a terrific snort and the crash of dry brush not more than 10ft. ahead of me. When I collected my senses the big buck that had been lying in the shade, was bounding a hundred yards away. How he came to let me get so close to him I am unable to understand, unless he was asleep. The scare was disagreeable, but the sight of the big chap as he

bounded so gracefully away, comes back to me as a beautiful picture.

I tracked a deer once so far, expecting to see him any moment, as I came upon his droppings still smoking, and an occasional form where he had lain down, that it became dark, and I was lost, and had to spend the night in the woods. But I had matches, and built a fire, and after a hearty supper from my haversack, with my pipe for company, I got along pretty well until morning, when I took the back track for home.

I was too green then to know that the buck was aware of my presence all the time, and was leading me a hard chase, while he was saving his energy for time of need. I say the buck, for the tracks were so big that I thought it could be nothing else, and a more fortunate hunter shot a large buck the next morning on the same line that I had been following. That was a disagreeable night's camp, because I was tired, and a misty rain set in to soften the snow and dampen my ardor. Yet I think I should like to try it again, for the remembrance of the comfortable smoke and the flickering camp-fire comes back to me with less unpleasantness than it seemed then. Still I should prefer a companion to talk to and smoke with, if he is the right kind.

Speaking of reason vs. instinct in dogs, I once owned a black setter that in leisure moments was my almost constant companion. I frequently took him to the office with me, where he would lie by my chair until I returned home. But as there were two railroad tracks to cross and constant traffic, I was fearful that he might be killed, and decided to leave him at home. One day after I had left the house, my wife's attention was attracted to the door by vigorous scratching and barking, and upon opening it was greeted by a tug at her dress and a streak of vanishing dog toward the gate. Going to see what was the matter, she opened the gate to look out, when Dot pushed through, and in five minutes was at the office, displaying as well as a dog can his pleasure over his cleverness. Was that reason or instinct? To me it looks like reason.

With a hearty invitation to spend a week in a good game country next fall, I am already anticipating. My guns and paraphernalia are in splendid condition, and the time seems long, but anticipation is a mighty good substitute for the real thing in close season. But I shall miss my best companion, the old dog who died last winter, and it will be hard to get another.

J. H. B.

PENNSYLVANIA.

Things of Night.

BONAVENTURE PILON, somewhat disgruntled, put back the rifle in the old torn canvas cover.

"Pourquoi pas?" he asked.

"I want to see them, that is all, Bonaventure. Just to paddle around."

The half-breed grunted. There was no understanding the man from the city. Last winter they had tramped together, and with an infinity of hard work had secured some good heads. In the fall they had successfully guiled a couple of moose with the birch bark horn, after several days of useless endeavor, but now that a fat deer could be got with no trouble, the eager pale man told him to leave the rifle in the tent.

The canoe seemed to drift away from the shore, and to make its way over the waters in a ghostly fashion. Not even a dripping from the paddle could be heard. The lighted jack at the bow turned into myriad gems the ripples raised by the soft night breeze, and all else around seemed a solid blackness, permeated by the harmonies of woodland night. From ever so far away came the sorrowing plaint of the loon, as of some eldritch thing hopelessly calling for a lost vision of happiness. The waving leaves upon the shores seemed attuned to a low grave chant, in which constantly recurred the same motive, as in some ancient rune sung low in olden times, in unknown tongues, to the melody of the harps of hidden minstrelsy. Strident cries of night-hawks overhead, sometimes near, then far, and further still, and the iterating sadness of the whippoorwill's cry, and the spooky voice of a great-horned owl perched high upon a blasted pine, all joined the mighty sound of the unfettered world at night, and blended with its great voice, and kept time to its strain, and lulled the slumbering earth with the marvelous strong harmony which some, hearing not, term the silence of the night.

So we floated on, and into the mouth of the stream, and the murmuring water rippled softly over the gravelly bar, with a little lullaby of its own, as if to keep good heart against the perils of its long journey into unknown worlds. Further on it seemed awed with its own daring, and stopped in a deep pool for a while. Here, on one edge of the tiny mere, near reeds that whispered soft things to some shade of night, the brilliant light fell upon a few ducks that, awakening, arose with much splashing and disappeared in the surrounding gloom. As the light fell upon a clump of alders by the water's edge a blue heron awoke suddenly, and in an ecstasy of fear he arose with a hoarse cry, with loudly flapping wings, bewildered and knowing not which way to go. As the canoe glided on, the stream narrowed once more, and again the water rippled over the shoals, and became deeper in turn, and then little black forms in the water came near, and with a tiny splash dived down, or left a silvery streak in the path of light ahead, and wondered why this strange phenomenon should disturb honest muskrats. The canoe glided on softly, and presently came to a place where a little island stands in the tiny river, and is surrounded by reeds, and the canoe thrilled and shook gently, for Bonaventure could not forbear to give the signal, though the rifle had been left home, and in the circle of light ahead shone two luminous points. Faintly we could see the head, and branching antlers, and the lithe graceful body, ghost-like and uncertain. The buck gave his blowing hiss, and slowly moved, still wondering at the light that streamed from out of the blackness of the night. And as he quietly stepped away it followed him like some uncanny thing, and of a sudden he was stricken with the terror of the unknown, and dashed crazily away, and the sound of his fleeing footsteps was lost on the wooded island.

So the canoe turned, and we retraced the same way, and came out upon the lake again, where the night wind

was blowing harder, and the melody of the silence of the night sounded in my ears with a charm unknown to those not born with that love of the woodland that passeth understanding.

We landed at the camp, and Bonaventure lighted his pipe, and like old friends we were long without speaking, for the spell was upon us, and finally, quoth he:

"He look awful pretty in the reeds. I never look at one so long at night before. It is very lovely hunting without a gun, but next fall we call the original, the moose, again."

So may it be!

Cuban Quail Fields After the War.

HAVANA, Cuba, May 30.—*Editor Forest and Stream:* Please to accept my best thanks for the copy of the *Game Laws in Brief*, which you sent me, and for the promptness of your response to my request for same.

You have rightly surmised my object in asking for it. I have recommended to the civil governor some needed modifications of our game laws, and he has referred the matter to the "Sociedad Economica" and to the "Academia de Ciencias Medicas, Fisicas y Naturales," and the commission named by these corporations has consulted with me in regard to it and I have handed in to it the copy sent with paragraphs marked ad hoc.

The most difficult task will be to secure respect for the game laws, either as modified or otherwise, in this island, where the habit has not been established in the customs of our people. Under the old regime those who took out and paid for a license to carry a shotgun and also another license to shoot with it (both for one season only) have been accustomed to use those privileges according to their own sweet will in every month in the year, regardless of the law that established a closed season prohibiting shooting between March 1 and Oct. 1 of each year.

In this island many coveys of quail come out of their shells in the last weeks of September, and consequently need the mother's care during all of the month of October, and the maternal solicitude refuses to abandon the young brood when pointed by the dog, thus falling easy victims to any pot hunter who may choose to sacrifice them.

For this reason I have recommended that the close season be extended to cover all of the month of October, and as a compensation liberate the month of March, as the quail here do not pair until April.

I have also asked to make the possession of game, alive or dead, during the closed season punishable by fine, and the hiding of it to be a higher grade of misdemeanor, and I have suggested some other modifications.

I have now some hope that with the aid of the police of the new regime we may establish here a faithful observance of the game laws in the customs of our population, which thus far has had a bad education in this regard. After this is obtained we may then establish different closed seasons for different species, as in other countries. This will not be practicable here until after several seasons of disciplinary education, because many, if allowed to take their guns into the fields, will shoot everything that comes in sight, and try to dissimulate by saying that they shoot only male birds, which they allege are of no further use after the females are served, and by other sophisms.

One would suppose that during three years of war, during which all shooting was limited to larger game, the quail would have greatly multiplied here. But this does not appear to be the case. On account of the very general destruction of the houses and cattle of the farmers, their fields have been turned into a wilderness of high grass and bushes, among which there remains no cultivated nor well-browsed fields, in which the mother birds and their tiny chicks delight to dwell and take their daily dose of health-giving morning sunlight, the absence of which at bottom of the tall, wet grass chills the tender brood to rapid extinction.

I took several outings during the season last past over fields where I had formerly gathered large bags of quail and snipe, but the grass was much too rank to get through without great difficulty and the loved ones were looked for in vain, or nearly so. Moreover, the favorite sloughs where the *Galinaga wilsonii* were wont to congregate I found quite monopolized by tall members of the vegetable kingdom, and no cattle had been there to curtail the growths and to trample the soil into the soft consistency required as feeding grounds for this lively immigrant.

The Field Sport Club, of which you inquire, passed into history some four years ago and exists now only as a pleasant reminiscence of the past. Of the twenty-five cattle farms which constituted its reserved territory, guarded by its two game constables, scarcely a house or outbuilding now remains, and no cattle are to be seen where then there were large herds bred and fattened.

Three years of most singular warfare has done its work of annihilation pretty thoroughly. Singular, because I know of no other in which both combatants vied with each other in the destruction of properties so that the other might not collect taxes upon it with which to continue the war. Both sides have been quite successful in gaining the end desired. Only the timely intervention of Uncle Samuel has limited the work of extermination of properties, although not strictly so, because many thousands of our population have actually died of starvation, reducing our population, according to my best judgment, to less than one million souls to the entire island.

These impracticable children of the ancient pseudo-ecclesiastical system of civilization (if civilization it may be called), if left to their own resources would undoubtedly follow the ideals under which they have been educated, and now they are resentful of the suggestion of Anglo-Saxon models; but as all their material interests are from geographical position indissolubly linked to that race on the neighboring continent, and Uncle Samuel has severed the political chain that bound the "Ever Faithful" to the antique system, time, the great physician to all human ills, must do the rest. There is nothing for it but to take his medicine.

The defunct regime has left us here a population that is morally sick and weak in many ways. If you Yan-

kees desire to contribute effectively to our regeneration you must begin with our material interests and send us less of embalmed beef and hard tack and more plows and work cattle, which you should widely distribute as a loan at low interest, to be paid from the products of the crops in small yearly instalments during the two or three following years.

The generous distribution of rations to the starving population has undoubtedly saved many lives, but is also raising a crop of vagrants.

Small detachments of cavalry as rural guards distributed to the country towns, each detachment accompanied by a practical and scientific farmer to teach the best use of American agricultural implements, would soon substitute the American plows for the crooked stick which we have inherited and which is still in general use stirring the soil only to the depth of about 3 in. of its surface.

We have no quail-destroying winters here, and for this reason the establishment of law-abiding customs by the strict enforcement of game laws during two or three years would populate our fields with such numbers of quail as to make of this island a sportsman's paradise.

ERASTUS WILSON.

In the Yellowstone Park.

MAMMOTH HOT SPRINGS, Y. N. P., May 24.—*Editor Forest and Stream:* I suppose we shall have to say it's spring here at last. The snow is off between here and Gardiner, and there is considerable green grass, and now and then you can see a wild flower or two along the road. I saw a few Johnny-jump-ups and the buds of some buttercups.

I see no game along the road, as most of it is working back. Antelope have gotten as far as Yancey's, although there are a few close to the town of Gardiner and on the flat across Gardiner River. Blacktail and elk have gone back too. The whitetails are not to be seen just now along the road, because there are crews of men putting the road in condition for the season's travel. It is possible to ride a horse to Norris Basin by going through Snow Gate, the old road. Golden Gate is impassable. Scouts and soldiers have been to Riverside Station and the Lower Geyser Basin this spring with horses, and to Yancey's and Soda Butte. The two troops of cavalry here now are to go to Manila; they will start soon after being relieved by M Troop of the First Cavalry. It is thought that it will be about July 1 before they can get away, as there are men at the outer stations that cannot be gotten in much before that date.

The spring is more than a month behind that of last year. Where the snow is off, the grass has not started, or is only very short. Toward Gardiner, the lowest and warmest section of the Park, the country looks a bit green.

The order I mentioned in my last, limiting licensed drivers to only one team, has been revoked. Now, five wagons for passengers, and all the baggage teams necessary for a party, are permitted with each license, only requiring the holder to accompany the party personally.

The Yellowstone Park Association are not going to have their lunch stations this year, but only the hotels. The transportation company or some other parties will run the lunch business at Norris, Upper Geyser Basin and the Yellowstone Lake (West Arm). I understand that no coupon tickets will be sold this year by the railroads including the Park trip. It will be a sort of free-for-all, and parties who are prepared for transporting tourists expect to do a large business.

Capt. Erwin has, during the past winter, added to the animals in the enclosure in front of the Mammoth Hotel two cow elk, four blacktail (mule) deer and four whitetail deer. They are looking very well, and it is expected that there will be some increase by births.

Scout Morrison, who has traveled many hundred miles this winter through the Park on snowshoes, tells me that there are over 200 dead elk between the mouth of Blacktail Creek and Hellroaring, a distance of about five miles along the Yellowstone River. These are mostly calves, with a few old bulls. There are about 300 dead elk along Soda Butte Creek and slopes toward Cache Creek, mostly again young elk, showing what a very hard winter it has been. On Falls River, during one of his snowshoe trips on March 1, he saw twelve moose, one herd of two bulls and three cows, and the others, three, two and a lone one. He saw two moose in the Madison Basin. These are more moose than ever before reported. Morrison found three dead mountain sheep along the Yellowstone River that had died of starvation. He saw twenty-six live ones that were very thin and starved looking.

After I wrote my last letter, while the ground was yet covered with snow, an order came from Washington to expend \$200 for hay for the antelope, deer and elk in the Park. Hay was scattered out where it was thought best, and as far as teams could get with it. I think it did considerable toward saving some of the smaller animals; but so few elk could be reached that only antelope and deer got much benefit.

The first young elk seen last year was May 21. This year I have not seen any, as I have not been out among them. I was out a few times after pictures, and got some of sheep, deer and elk. Some very good photos of elk and other game were secured by Scout Morrison and one of the soldiers.

The bears are out now at the Fountain Hotel. Six were seen one day last week, all black. If the bears in the Park are as troublesome as last season, some of them will have to be killed to give others a lesson in good manners, as it's not thought polite for them to climb into wagons and eat up all the provisions belonging to camping parties.

E. HOFER.

Where to go.

ONE important, useful and considerable part of the FOREST AND STREAM's service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

Natural History.

The Danger of Introducing Noxious Animals and Birds.

BY T. S. PALMER, ASSISTANT CHIEF OF BIOLOGICAL SURVEY.

From the Yearbook of the Department of Agriculture.

(Continued from page 427.)

The English Sparrow.

THE house sparrow, better known in America as the English sparrow (*Passer domesticus*), is a common bird of north central Eurasia. It is said to range as far north as latitude 67 degrees in Europe and to latitude 61 degrees in Asia. The damage which it does in destroying fruit and grain, in disfiguring buildings in cities and towns, and in driving away other birds, makes it one of the worst of feathered pests. The rapidity with which it increases in a new locality is scarcely more remarkable than the persistency and care which have been displayed in introducing it into foreign lands, in spite of the warnings of persons familiar with its habits. It has gained a foothold on all of the continents, and has been transported to some of the most distant islands in the Indian and Pacific oceans. In North America it has not increased very rapidly north of the Transition zone nor in the Lower Austral, but wherever it has become at all abundant efforts to exterminate it have been practically futile.

The English sparrow was first introduced into the United States by a gentleman of Brooklyn, N. Y., who brought over eight pairs from Europe in the fall of 1850 and liberated them in the following spring. These birds did not thrive, and in 1852 a second importation was made. In 1854 and 1858 the sparrow was introduced at Portland, Me., and in the latter year at Peacedale, R. I., and a few birds escaped at Boston, Mass. During the next decade it was imported direct from Europe to eight other cities, and in one case 1,000 birds were sent to Philadelphia in a single lot; birds were also distributed from the colonies already started in this country. By 1870 it had become established as far south as Columbia, S. C., Louisville, Ky., and Galveston, Tex.; as far west as St. Louis, Mo., and Davenport, Ia., and as far north as Montreal, Canada, thus gaining a foothold in twenty States, the District of Columbia, and two Provinces in Canada.

Between 1870 and 1880 it was estimated that its range had been extended by nearly 16,000 square miles, and isolated colonies were established at San Francisco (1871-72) and Salt Lake, Utah (1873). During the next five years it spread over more than 500,000 square miles, and in 1886 had become established in thirty-five States and five Territories, occupying practically all of the region east of the Mississippi River (except portions of Florida, Alabama and Mississippi), as well as parts of eight States in the West. Its range was estimated to cover 1,033,000 square miles, including 148,000 square miles in Canada.

At the present time (1898) only three States (Montana, Nevada and Wyoming), and three Territories (Alaska, Arizona and New Mexico), are apparently free from the sparrow. Its range extends westward to the Great Plains and in Colorado to the Rocky Mountains, and also occupies considerable areas in Utah and central California.

The true character of the bird is now so well known that it is unnecessary to dwell on its injuries to fruit and grain, the nuisance it has become in large cities, and the extent to which it has replaced native birds. The ill-directed care and energy expended on introducing and fostering it thirty years ago are largely responsible for the marvelous rapidity of its distribution. Now, when too late, efforts at extermination have been begun, and four States (Illinois, Michigan, Ohio and Utah) have offered bounties for its destruction, the expenditures in Illinois (1891-1895) and Michigan (1887-1895) amounting to about \$117,500.

Besides the United States, New Zealand and Australia have suffered considerably from the English sparrow, and in some of the colonies of Australia it is considered second only to the rabbit as a pest. It seems to have been introduced on the North Island of New Zealand in 1866, by the Wanganui Acclimatization Society.¹ By 1870 it began to be numerous, and twelve years later threatened to spread over the whole island, becoming established in the most inaccessible regions, in spite of its usual partiality for cities and towns. In Victoria the sparrow was introduced about 1865, and probably appeared soon after in Queensland, New South Wales, South Australia and Tasmania, but data are lacking as to the date of its first appearance in these colonies. It has increased so rapidly that, in order to hold it in check, "sparrow destruction" bills have been passed in several of the colonies during the last ten years.

Thus far the sparrow has not gained a foothold in Western Australia, and radical measures have been adopted to prevent its introduction. Its importation was prohibited by the "Destructive birds and animals act," passed in 1893, and when a few birds were discovered in Perth in January, 1898, prompt measures for their extermination were taken by the bureau of agriculture. All that could be found were shot, and attention was called to the necessity of stamping out the pest before it spread beyond control.

The English sparrow has also found its way into many other distant corners of the earth. It is gaining a foothold in Argentina, and has been carried to remote islands. In the Indian Ocean it is present on Mauritius, about 400 miles east of Madagascar, and on the Comoro Islands, off the southeast coast of Africa and 350 miles northwest of Madagascar. It was first reported from Grand Comoro in 1879. In the Pacific Ocean it has been introduced on the Chatham Islands, some 500 miles east of New Zealand,² probably on New Caledonia, and on the Hawaiian Islands. In the latter group it is reasonable to suppose that it was introduced by way of San Francisco in the early seventies, since it was reported to be numerous at Honolulu in 1879. In the At-

¹ Rept. New Zealand Dept. Agriculture, 1897, Div. Biology, p. 8.

² Ibis, 1893, p. 543.

lantic Ocean it is present on Bermuda, the Bahamas and Cuba. It was sent to Bermuda from New York about 1874, and two years later was given the same protection accorded to other birds, its destruction being punished by a fine of 5 to 20 shillings. Ten years after its introduction it had increased so enormously that a bounty was offered for its destruction, and between 1884 and 1886 about £530 (\$2,650) were expended, without causing any appreciable decrease in its numbers, notwithstanding the short time the bird had been present and the fact that the islands have an area of less than twenty square miles. It is said to have been imported into Cuba, and in 1877 was reported to have been introduced on New Providence, Bahamas, "within the last few years." It has not, however, increased rapidly on either island, for in 1891 it was reported as still not abundant, and apparently had not extended its range to any of the neighboring islands.

The Starling.

The starling (*Sturnus vulgaris*) of Europe and western Asia is one of the best known birds of the Old World, and during late years has been increasing in numbers in the British Isles. It is sometimes accused of stealing fruit and destroying nests and eggs of other birds, but in its native home it seems to be beneficial rather than otherwise. Comparatively little accurate information concerning its food habits is available, except the results of an examination of 175 stomachs recently made in Scotland by Mr. John Gilmour.³ According to this examination the food consists of 75 per cent. insects, 20 per cent. grain (mainly waste grain), and 5 per cent. miscellaneous substances. Some useful insects were eaten, but the greater proportion were classed as injurious. The charge of destroying eggs of larks and occasionally young nestlings was not substantiated, as no eggshells were found in these stomachs. Mr. Gilmour calls attention to the rapid increase of starlings in Fife-shire, thousands now existing where fifty or sixty years ago they were considered rare, and mentions the serious damage sometimes done to shrubs and young plantations when occupied as roosting places, but concludes that on the whole the bird is beneficial and worthy of protection.

Several attempts have been made to introduce this species into the United States, but as yet it has hardly obtained a foothold. One of the first importations was made by the Acclimatization Society of Cincinnati, O., in the winter of 1872-73. About 1877 a number of starlings were liberated in Central Park, New York, by the American Acclimatization Society, and several similar experiments have since been made, but only the last seems to have met with success. About sixty birds were released in 1890. Some of them have bred for several years, and, leaving the park, have established themselves in favorable places in the neighborhood. In 1893 and 1894 flocks of as many as fifty individuals were reported to have been seen in the suburbs about the northern end of the city, and late in 1898 a flock of about thirty took up residence at Sing Sing. During the last two or three years a few have been seen on Long Island, about Brooklyn. Thirty-five pairs were liberated at Portland, Ore., in 1889 and 1892, where they are said to have done remarkably well, and as recently as June, 1898, a few were seen about the suburbs. In the autumn of 1897 it was reported that starlings were to be imported for the city park at Allegheny, Pa., but as yet only a dozen or fifteen seem to have been introduced, and these have been carefully kept in captivity for breeding, with the intention of ultimately stocking the park.

Much has been said concerning the advantages of introducing the starling into this country, but in spite of the many arguments brought forward, the bird's character is not above suspicion, and its usefulness is still open to question. The fact seems to have been overlooked that in other countries the starling has signally failed to fulfill the expectations concerning its usefulness. Certainly the experience of Australia and New Zealand offers little encouragement. It was introduced in New Zealand in 1867, and as early as 1870 was reported as "becoming very numerous." It seems to have increased very rapidly, and in spite of its natural preference for insects, in its new home it has adopted a fruit diet to such an extent as to become a great pest.⁴ In South Australia it was reported to be common in certain localities in 1894, and measures for its extermination were considered. In Victoria, on the other hand, steps were taken in 1895 to promote its increase in fruit and grain growing districts, and this fact was used as an argument in its favor by persons who were endeavoring to introduce it into some of the other colonies. Western Australia has taken a firm stand on the question, and Mr. R. Helms, biologist of the Bureau of Agriculture of that colony, who opposed the proposed importation, gives his reasons as follows:

"Had I been asked fifteen or twenty years ago what I had to say, I would probably have recommended their introduction. But not so now. My experience has taught me better. The birds were introduced more than fifteen years ago into New Zealand, and now, like the thrushes, they have become a pest to fruit growers. They have changed their habit from being principally insectivorous to having become omnivorous."⁵

After due deliberation, the Government issued a proclamation on Jan. 22, 1896, declaring the starling a destructive bird and absolutely prohibiting its importation into Western Australia. Still more recently it has been condemned in Tasmania, where it is charged with committing depredations on small fruits, cherries and wheat. Its further distribution has been discouraged, and when the question of introducing several species of birds was under discussion at an agricultural conference at Scotsdale, on Dec. 6, 1897, the starling was promptly rejected.⁶

The Mina.

The mina, or mynah (*Acridotheres tristis*), is common throughout most of India, except Kashmir and Tenas-

serim. In its habits it is somewhat like our native grackles or crow blackbirds, but seems to resemble the sparrow in its familiarity and partiality for human habitations. It was introduced more than thirty-five years ago into Mauritius to destroy grasshoppers, and is said to have become perfectly naturalized there.⁷ It has also been introduced into the Andaman Islands (some time prior to 1873), the Hawaiian Islands, New Zealand, and possibly Australia.

It is said to have reached the Hawaiian Islands by way of China. Dr. Finsch, an eminent ornithologist, who visited Honolulu in 1879, found it very abundant, and describes its habits as follows:

"The mainas are a great nuisance to the inhabitants, as they drive away the pigeons and fowls, and are said to destroy the nests and eggs of the domestic birds. That they do drive out the pigeons from their houses, I observed many times myself. * * * In Mr. Barn- ing's garden, where the finest trees, chiefly palm, abound, hundreds and thousands come to roost, and their inhar- monious concert lasts from 6 in the evening for an hour or more. The same is the case at daybreak, a little after 5 o'clock."⁸

The Kohlmeise, or Great Titmouse.

"Kohlmeise" is the German name of the great titmouse of Europe (*Parus major*), and this designation is used to some extent in the United States. The kohlmeise is com- mon over the whole of Europe as far north as the arctic circle and also in Siberia. It is a handsome species, about the size of the common eastern chickadee (*Parus atrica- pillus*), but may be readily distinguished from any Amer- ican titmouse by the dull yellow on the sides of the body and the broad black stripe extending down the center of its breast. Like other species of the genus, it is mainly insectivorous, but in winter is said to eat nuts and hard seeds. The kohlmeise has recently attracted attention on account of its alleged value as a destroyer of the codling moth (*Carpocapsa pomonella*), particularly in Germany, where it is reported to protect apple trees in large measure from the attacks of this destructive in- sect. But although several German authors regard it as a most useful species, there seems to be no satisfactory evidence that it is partial to the codling moth, or in fact that it ever feeds on the moth to any great extent. In Great Britain where the kohlmeise is also a resident and generally distributed, its presence has not been sufficient to exterminate the codling moth or even to hold this pest in check. On the other hand, it is said to attack small and weakly birds, splitting open their skulls with its beak to get at the brains, and doing more or less damage to fruit, particularly pears. One English observer re- ported that all the pears in his garden had to be inclosed in muslin bags to protect them from the birds, which would otherwise eat a considerable part of the fruit before it was ripe. Another reported that the great titmouse spoiled most of a limited crop of apples, and then began on the pears, boring a small hole near the stem, and pass- ing from one pear to another until every one of forty or fifty trees had been damaged. It also attacked figs, scoop- ing them out before they were ripe.

In the autumn of 1897 an article appeared in a paper in Idaho setting forth the great value of the bird to the fruit grower, and strongly advocating its importation into this country. The article attracted the attention of horticul- turists throughout the Northwest, and gave rise to con- siderable discussion concerning the merits of the bird and the desirability of its introduction. While the kohl- meise might not develop its fruit-eating propensities in America, it should not be introduced until more definite information is available concerning its habits and until it has been shown beyond question that it will do no serious harm. Moreover, since there are already several titmice of the same genus in the United States, it seems entirely unnecessary to add another to the list, for it is hardly probable that the European bird would confine itself to the codling moth or be of more value to the horticul- turist than the native species. It may be added that re- cent investigations seem to show that the common east- ern chickadee feeds to some extent on the codling moth, as a few larvae, believed to be those of this insect, have been found in chickadee stomachs collected in New Hamp- shire during February and March.⁹ It may be of interest also to recall the fact that the kohlmeise was actually in- troduced in 1874 at Cincinnati, Ohio, but the experiment failed, as neither this nor any of the other exotic species imported at the same time became naturalized.

The Skylark, Green Linnet, and Black Thrush.

The skylark (*Alauda arvensis*), the green linnet (*Ligustrum chloris*), and black thrush, or black bird (*Tur- dus merula*), are all natives of Europe. They are chiefly of interest in this connection, because in their native home they are almost universally considered beneficial, but in New Zealand they have developed traits which render them far from desirable additions to the fauna of that is- land. They were introduced into New Zealand in 1867; in 1870 they had begun to breed in a wild state in the Province of Auckland on the North Island, and the green linnet was reported as already becoming common.¹⁰ At the present time they are common all over the colony, and troublesome in certain districts. The skylark confines its injuries mainly to turnips, eating the seed soon after it is planted, and thus causing no small damage to the future crop. The green linnet is similarly injurious to grain, while the black thrush is accused of taking straw- berries, currants, raspberries, and other small fruits. As a fruit destroyer the black thrush is said to be worse than the English sparrow, and the proposal to introduce it into Western Australia elicited a strenuous protest.

The skylark has been introduced several times into the United States, especially in the vicinity of New York, and recently all three birds have been liberated in Oregon, but as yet they have not increased to any extent. Both the skylark and the black thrush are noted singers, but the charms of their song hardly compensate for damage to crops.

⁴ Ibid., 1880, pp. 77, 78.

⁵ Weed, Bul. 54, N. H. Coll. Agr. Expt. Station, 1898, pp. 87, 94.

¹⁰ The green linnet has found its way to the Kermadec Islands, 600 miles to the northeast, and all three species are said to be now present on the Chatham Islands, nearly 500 miles east of the South Island of New Zealand.

[TO BE CONTINUED.]

The Wild Pigeon.

Editor Forest and Stream:

Wild pigeons seem to be the all absorbing topic now, and although the light that I can throw on it is only the light of a tallow candle, FOREST AND STREAM can have it for what it's worth.

Something like forty or fifty years ago I was visiting a friend on the then open grounds of Euclid avenue, in Cleveland, and pigeons were flying over in such vast num- bers that people got so tired of them that it was difficult to give them away, so my friend and I stopped shooting them. They flew very low, and on the glorious Fourth we thought we'd make our powder do double duty, so we took our chairs out under a tree in the yard and shot single ones out of the flocks as they passed over. By noon we had dropped about 100, and as we found it difficult to give them away we quit the business. It was in June and July, and they were feeding on the cherries in the yard from morning till night. They were so tame that they were not in the least disturbed by our walking under the trees, and as I was sitting at the window one day a flock of them walked along the path not roft, from me. They seemed to be swarming everywhere, and the air was about black with them for about two months, all going one way, and if they did not go to some feeding ground and re- turn by another route there must have been such countless millions of them that all the market shooters—otherwise loafers—could never have exterminated them. My theory in regard to their mysterious disappearance is that being heartily tired of ceaseless persecution they held a conven- tion to devise ways and means of preserving their health and decided to move to Central America, where people are too ignorant to know they are good to eat.

Dr. Blaisdell says he has written to all parts of South and Central America, but can find no trace of them. I know Central America well enough to know that he might write till doomsday without learning anything from them, for I never met a man down there who knew a pigeon from a porcupine.

I tried on one occasion to tempt my host with as nice a string of yellowlegs as I ever saw, but he hooted at the idea of eating such things, and I was forced to make a fire outside and roast them on the end of a stick. They have but one cooking utensil—a pot—into which every- thing goes, from a lizard to a monkey.

While stopping at Santa Marta on the Carribean coast I took a mule ride across to Cieriega, about twenty or thirty miles, and found the scenery commonplace and rough, with poor, hard soil, and plenty of cactus trees, on the fruit of which wild pigeons were feeding by wholesale with none to molest or make them afraid.

When I reached my destination I took a stroll in the woods close by the town, and as a pigeon flew across I shot it to see what it was like. I could see no difference between that and our own, though an ornithologist might, and had I known what a fuss their migration was going to make in the world, I certainly would have skinned one and brought the skin along.

They were flying about in all directions, usually singly, and I could have stood in the road and shot them as fast as I could load my gun. My individual belief is that our pigeon and that are one and the same, but that doesn't settle it.

ST. AUGUSTINE, Fla., May 20.

Wild Pigeons in Connecticut.

NEW HAVEN, Conn., May 29.—Editor Forest and Stream: Such an interest seems to exist about the wild pigeon as to cause me to keep a sharp lookout for the birds. One year ago last fall I saw eight or ten in a flock; then again I saw one last summer, and I reported both cases to FOREST AND STREAM. Now I am pleased to say that about 4 o'clock last Friday afternoon I saw two more, probably mates. I came across them while driving home, and they were about in the same place where I saw the flock. This is in the town of Hamden, and five miles from New Haven. The birds were in a tree by the roadside, and I had a good look at them before they flew and after.

H. H. AVIS.

Weights of Raccoons.

LOON LAKE, N. Y.—In a recent issue of your paper S. asks for data regarding the weight of raccoons. I have hunted them in this section and in northern New Eng- land for many years, and have seen some large ones, but none so large as the one whose weight he records. The largest I ever secured was a fine old male that tipped the scales at just 25½ lbs. The coon will average, I think, about 17 or 18 lbs., one of 20 lbs. being considered an un- usually large animal. I once heard of one being killed that weighed 40 lbs., but, as I did not see the animal, could not vouch for it. A short time ago a man near here, in St. Lawrence county, killed two that weighed 28 lbs. each. Late in the autumn the coons are in the finest condition, and consequently reach their greatest weight. In the spring, after their winter's hibernation, they are often only skin and bone. Deer wintered well in this section and are very plentiful, and everything points to a fine time for the sportsman this autumn when the season opens.

KENEWAH.

The Jumping Deer.

THE Indian name for the jumping deer quoted in Mr. Hallock's paper in May 27 issue, should have been printed "Wa-wash-ka-she."

THE FOREST AND STREAM is the recognized medium of entertain- ment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be re- garded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

³ Trans. Highland and Agr. Soc., Scotland, 1896.

⁴ It is also interesting to note that nearly twenty years ago an eminent English ornithologist predicted that in foreign countries the starling would undoubtedly aid in destroying native birds. (Newton in Yarell's British Birds, 4th ed., II., 1876-1882.)

⁵ Producers' Gazette, Western Australia, V., January, 1898, p. 29.

Game Bag and Gun.

Exterminatory Peregrinations.

ST. AUGUSTINE, Fla., May 29.—*Editor Forest and Stream:* I observe what you have to say in your issue of May 27 in comment upon the new Florida game law, which restricts the amount of game a person may kill in a year and imposes a license fee of \$10 on the non-resident shooter. You may perhaps be sustained in your somewhat cynical suggestion that we have "locked the stable door after the horse has been stolen;" but I think you will grant that at least we deserve credit for having waked up finally to the situation. We should surely have your sympathy, too, and the sympathy of all right-minded sportsmen in the North, if they could realize a tenth of the obstacles we who are enlightened in the matter have had to contend against, and still are opposed by, in the ignorance, indifference, obstinacy and animosity of our opponents. In this new law we have at least something to build upon, a foundation upon which in the future may be established legislation which shall be in every respect sound and efficient to accomplish the purpose we are fighting for. Visiting sportsmen may resent the discrimination made against them. They should understand, however, that, as you suggest, we need money to enforce the law, and they should be willing to contribute to this end. The revenue derived from licenses is to be expended exclusively for the purpose of game protection through enforcement of the law. This means that the stock is to be preserved in so far as obedience to the law will insure that end. Certainly if the limit prescribed by the statute shall be observed by all shooters, both native and foreign, the fecundity of the birds may be depended upon to restock the covers, and we may expect a sufficient supply for years to come.

Moreover, while I am not prepared to say that any spirit of hostility to the non-resident shooter had influence in framing the law just as it is, there is a growing impatience at the wanton character of many of the shooters who invade the State from the North. Indeed, when one considers the abominable atrocities which have been perpetrated in Florida by game slaughterers of what I may call the "Coquina" type, one marvels at the indifference, not to say complacency, with which their bloody exploits have been permitted to go unpunished. I have used the expression "of the Coquina type" because the practices of game butchers of this sort have been so well set forth by Mr. Geo. O. Shields (Coquina) in his narrative of his personal exploits in Florida. I have just been looking over the story of his doings here as told by himself, and it is worth while to recur to it, because it is typical of one kind of "sportsmen" we have had to deal with.

Mr. Shields made a trip up the St. John's River and to the Gulf Coast. The story of the expedition is told in a volume which now lies before me, entitled "Hunting in the Great West (Rustlings in the Rockies)." While the bulk of the volume is given up to the record of slaughter of big game in the West, some chapters of it are devoted to an account of his Florida expedition. From Jacksonville Mr. Shields took passage up the St. John's River on the steamboat Georgea. Game, he tells us, was then abundant in all that vicinity—deer, turkeys, quail and alligators.

"On the morning of the 17th," he relates, "at 7 o'clock A. M. we were under way. Capt. Schoonmaker, master of the Georgea, informed us that we would find plenty of game from this point up, so we brought out our guns—Dr. W. got his shotgun and I my rifle. We took up our positions on the quarterdeck ready for business."

And he was not long in getting to "business," for he relates:

"We had gone but a few miles when the ladies, who occupied seats in the pilot-house, shouted, 'There's an alligator!' We looked in the direction indicated, and there, sure enough, was one of the gigantic saurians lazily swimming across the river, some 200yds. ahead of the boat. The captain said they were wild, and that he would not let us come much closer, so I opened fire on him, and in quick succession landed three bullets in such close proximity to his eyes that he at once sank out of sight."

When the next alligator was seen, after carefully adjusting his sights our sportsman put a ball "through him just behind the shoulder. Then there was sport! He gave us such a gymnastic exhibition as only a wounded 'gator can give. He first tried to stand on his head, then he tried to stand on his tail. Then apparently tried to turn himself wrong side out. Finally, recovering temporarily from the shock, he reached the water, and was lost to our sight forever."

The satisfaction manifested here appears to have been based on witnessing the contortions of the wounded and dying creature. This gleeful enjoyment of the death throes of his victims is manifested on other pages of the volume. To witness the convulsions of pain and the death agonies appears to have been so pleasurable as to afford an adequate reward for the long journey from the North to Florida. Alligators, however, were not the only objects of this slaughter waged from the deck of the passing steamer. The beautiful plume birds we are now lamenting were conspicuous in those days and offered marks which received unremitting attention. Mr. Shields records:

"During the remainder of the day we had fine sport shooting blue herons, white egrets, blue and white ibises, ducks, cormorants, coot, etc., but owing to the motion of the boat (she made about fifteen miles an hour) I made rather a poor score with the rifle. The Doctor with his shotgun did much better. Game is very abundant all along the river."

It is not so abundant now.

The pictures painted of these practices of Coquina and his fellow sportsmen are very vivid, and if anyone wonders at the present condition of our Florida rivers compared with what then existed of the wild life peopling them, he may find his perplexity fully satisfied in such paragraphs as this:

"A brisk 'norther' was blowing this morning, accom-

panied by a cold, driving rain that rendered the cabin far more comfortable than the open deck, so we oiled our guns and laid them away. But time did not drag, for the captain entertained us with many interesting stories of life on the St. John's. He says he frequently has as many as twenty-five sportsmen on board at once, armed with shotguns, rifles, revolvers, etc., and that they make sad havoc among the waterfowls, 'gators, etc. That if a birds escapes the fusillade that is opened on him the moment he appears within range, it can be regarded as only a miracle. The 'gators, he told me, fare no better, and hundreds of each are killed every winter, and still there is no perceptible decrease in their number. Many of the latter are wounded who speedily recover. He thinks there is not an alligator on the river five years old but carries 20 to 30lbs. of lead in his carcass, and he notices that it is very difficult for some of them to swim with even their noses above water, on account of the extra ballast they carry."

When Mr. Shields got to the Gulf Coast he found the wild birds there in a condition of blissful ignorance and unsuspecting security, which made easy the sport of doing them to death. Going through the pine woods out from Manatee, Mr. Shields came to some ponds. Of one, he records:

"We saw in it a dozen or more of the large water birds which are so numerous in this State. I brought out my rifle and bagged a beautiful white ibis. A mile further on we came to another pond. A large white egret sat near the center of it, about 250yds away. I drew a bead on him, let go, and he immediately sat down."

"We passed a dozen or more of these ponds during the day, and at each of them I got a shot, making a very handsome bag, considering that I was 'going somewhere' and not on a regular hunt."

Again, in a series of ponds in the open pine woods, he tells us, "We found plenty of the large water birds so numerous in this State. We took an occasional shot at them when one offered a tempting mark and bagged a large number during the day."

So much for the Florida plume birds, whose destruction we have all of us been making so much ado over and blaming the millinery hunters for exterminating.

There were alligators on the coast, too, and our sportsman reaps new honors in his warfare waged upon them. He appears to have come to Florida as a modern St. George, imbued with a ferocious determination to find here the Dragon worthy of his lead. "I was thirsting for the blood of a 'gator," he tells us. But he was not so thirsty for 'gator blood as to disdain a "fine young doe," upon which he drew a bead and "she doubled up." Nor were the garfish swimming in the creek beneath his attention. He tells us, "We saw large numbers of garfish sporting in the sunlight. We shot a few of them merely for pastime." You see, he had come to Florida for pastime, and Florida, in its humble way, was trying to afford pastime.

But the alligators were the real "game" the expedition was after, and the saurians were found in the creek which was the destination of our hunting party.

"One of them stuck his head out of the water, whereupon Capt. S. gave him a charge of buckshot in the vicinity of the eye and ear. He lashed the water into a foam in his gyrations, and sank out of sight, probably mortally wounded. Presently another one puts his eye out of water to look at us. He was near the opposite shore, perhaps 50yds from where we sat. I let go at him, and although I scored a palpable hit, did not kill him."

The actions of a wounded alligator are described vividly, and with gusto. Mr. Shields gives us this lesson in the torture of reptiles:

"A 'gator always tells you, unerringly, whether you have killed or only wounded him. If wounded, he plunges and thrashes around at a lively rate for a few seconds, and sinks out of sight; but if killed dead he performs about the same series of evolutions, turns on his back and dies, remaining on top of the water."

And he goes on to tell about what happened when he got himself fairly in action:

"The smoke had scarcely cleared away after my last shot, when a third 'gator looked up near us, and instantly caught a right fielder in his left eye, that turned him over. We then supposed we had made it so warm for them that no others would show themselves for a while, so we started down the stream. The Captain and I had gone a little ahead, when Jack, who had not yet started, called to us, and said: 'Here's another 'gator.' I went back, and there, sure enough, was an old fellow swimming along down the creek as unconcernedly as though he had never heard the report of a gun in his life. I waited until he came within about 50ft. of me, and then gave him one in the leeward optic. He turned two or three somersaults, and stopped on his back with one forefoot sticking out of the water. We left him there as a warning to his kind."

"As we were now thoroughly sated with this class of sport," he concludes this interesting episode, "we returned home."

We Floridians are frequently accused of being indolent and lazy; and when your true sportsman from the North came among us in those days he set us an example of energy and assiduity and industry which should have put us to shame. There are only twenty-four hours in a day here in Florida, as further North, and the short twilight gives quick place to a rapidly falling night. The days are not long enough for the activities of sportsmen of the Coquina stripe. Mr. Shields' book tells us that his nights were well employed. One night would be spent in fishing for sharks by means of set lines, hauling them in to butcher in the morning; another night in fire-lighting for deer with buckshot; another night in spearing fish by firelight.

But the main purpose of this expedition, if we may judge from the amount of space given to it, was the alligator. I quote again:

"Presently I saw two lying on a low grassy bank away up the creek, sunning themselves and looking like great black logs. I drew back again and proceeded as quietly as possible to a bend in the creek that would bring me

within range of them. They heard me before I reached the point, however, and plunged into the water. I stepped behind a neighboring pine tree and waited a few minutes for them to come up. I did not have to wait long. One of them arose to the surface 100yds. below me. I did not molest him, for I thought I could do better. In a few minutes the other put his eyes out of the water near the opposite bank, not more than 50yds away. I looked through my globe sight, saw his great black eye glisten in the sunlight, and pulled. He doubled up, and his back came out of the water until he formed a great half circle. Then he went down, and next his head and tail came out approaching each other until they almost met. Then he disappeared again, and at once reappeared, doubled and twisted into an almost indistinguishable mass. When he unfolded himself this time he remained on top of the water, lying on his back, and then I knew that he was dead."

Our admiration is compelled by the thoroughness with which Mr. Shields quartered his ground. Our admiration or disgust; it depends upon how we look at such things.

All was game that had life and lacked sense to know he "was loaded" and to keep out of range of him. Going through a tract of pine woods, he tells us, the "monotony was relieved by ponds scattered along the entire distance, at each of which we got a shot or two at the large water birds which always hover around them"; (parenthetically, they don't hover so much as they did before Coquina passed that way). "This is indeed the happy hunting ground—the sportsman's paradise," he tells us as he found it. There is not much paradise about it now except for an occasional turkey buzzard.

And even those nocturnal creatures which hide in caverns and hollows were not permitted to escape his keen scent for game. The party was camped one evening, when:

"Jack started to the river to get water for our coffee, and as he passed the end of a large hollow log that lay a few feet from the fire, he heard a slight noise in it. We cut a stick and passed it in, when we found there was 'something alive in it,' as Dundreary says of his hat. We put a bunch of dry moss in the opening and set fire to it. In a few minutes a 'possum came tumbling out through the fire, and old Rover, who stood there waiting for him, made short work of him."

I shall always regard that picture of a burned 'possum tumbling out through the flames into the jaws of the dog as one of the finest things in the literature of true sport as it is here literated by Mr. Shields.

That same night a great owl, all unsuspecting the explosive character of the strangers who had invaded his wilderness haunt, ventured to perch on a limb above the camp. It was his last perch. The owl went the way of the plume birds, alligators and 'possums. The next day "while we were at supper, a large 'gator raised his head in the middle of the river opposite our tent. I sent a message from 'old reliable,' and in an instant more he was lashing the water into a foam, minus an eye."

Judging from his own record, as given by himself in this account, Mr. Shields counted the success of a shooting trip by the amount of torture he was able to inflict upon his victims, and the success of a fire-fishing trip by the number of fish taken or the pounds they weighed. One night when he was fire-fishing with a party sticking fish with spears, he records with exultation, "We killed over 100lbs. of fish during the two or three hours we were out." Again, "We returned to the house about 9 o'clock, having taken over 60lbs. of fish." This Florida fishing, however, really did not amount to much, compared with the scores made by Mr. Shields, which Mr. Shields here records with exclamation marks, as having been made by himself and friends in Michigan, among them an "afternoon's catch 180lbs. of fish!" Again, "Total catch for the day weighed 210lbs." Again, "They also brought in a fine string of bass, making the day's catch weight in all 240lbs., and the grand total for the three days 620lbs."

While we are in Michigan I may be permitted to quote an illuminating paragraph from his account of a little excursion in that State, as given in this same book. After having formed the night before one of a party which had headed off a deer, driven into the water by hounds, and killed it by a ball in the head as it was swimming for the shore, in the morning he went on board the little steamer Northern Belle to go to Cheboygan.

"The captain informed us," he writes, "that we would probably see plenty of ducks, loons, etc., on the trip, so we brought out the 'hunter's pet' rifle and enjoyed some very fine sport, shooting from the bow of the vessel. Several ducks were taught the folly of exposing themselves to the unerring aim of some of our crack shots. A small diver was killed by an unusually long shot, several on board pronouncing the distance at least 200yds. A woodduck was cut down on the wing as he crossed the channel about 40yds. away. Several others were killed as they sat in the water, and all while the boat was in motion, making, altogether, a rather remarkable score for a morning's shooting with the rifle."

But to come back to our own Florida. I have not pretended to give all of the game slaughtering exploits here recounted, for I hesitate to trespass upon your space. It is evident from the widespread death and destruction which followed in his wake, and from the prodigious rain of ammunition erupted by him, so to speak, as he passed through our pine barren and hammocks, and along our water courses, that Mr. Shields must have been heavily loaded with powder and ball and buckshot. He does not give us the details of his armament, but we may get some hint of it from this advice he gives intending Florida tourists as to how they should fit themselves out before invading our devoted land:

"A shotgun and rifle will both be needed, though a cylinder-bore shotgun and supply of buckshot cartridges in addition to the supply of small shot may answer all purposes. The greater need of the rifle is for the larger game, which frequently offers long-range shots where a shotgun is entirely useless, and if the sportsman be a clever rifle shot he should always provide himself with both."

"A large supply of ammunition should be provided for

each, for there is such a great variety and such countless numbers of birds and animals constantly presenting themselves, that although many of them be not game, still the temptation to shoot them is so strong that few resist it. For instance, there are cranes, pelicans, cormorants, water turkeys, alligators, etc., offering shots at all ranges, and affording such fine opportunities for practice that anyone is justifiable in improving these opportunities when not in localities where game is to be found. I estimate, from experience and observation, that an enthusiastic sportsman will shoot away 300 shells in each week that he may spend in Florida, and if he be provided with rifle and shotgun both, perhaps an equal division of this number between the two would not be far from the proper figure."

Heaven defend us!

Verily, if his name were not on the title page, I would hesitate to believe that the Mr. Shields whose personal doings in Florida and advice to other visitors are contained in this volume is that very same Mr. Shields whose persistent and iterated hue and cry of "game hog" is dealt out as generously to his fellow human beings as here in Florida he distributed his bullets and buckshot among the unwary brute creation. Methinks that if that alligator which Mr. Shields "gave one in the leeward optic" could come to life again he would "wink the other eye."

Now, I need not say that I am very far from having any intention of classifying all the Northern sportsmen who have visited our land as being driven about by a restless spirit of destruction as was I by the gadfly. It would be a scandalous libel upon the craft of sportsmanship to picture it as made up of such lust for blood, such devilish cruelty, such fiendish enjoyment of the death agonies of inoffensive creatures as pervades the pages of these Florida "rustlings." But you must remember that such accounts as this given by Mr. Shields of his doings in Florida are those which make the strongest impression and go furthest in forming public opinion about sportsmen and their character. This is very unfortunate, but it is true. The guild of sportsmen has often suffered obliquely which was altogether unmerited because an ignoble part was thought to stand for the whole; and as I have said, the astonishing thing is that in spite of the boasts in print of men who have waged a war upon animate nature in our woods and along our water courses, we have been so long in taking any measures to put a stop to the killing. As you suggest, the horse is stolen. All we can do now, however, is to make the best of it, and trust that with a better administration of our native resources the waste places may once more be made vocal with the songs of birds, the wilderness may be brightened with the brilliant colors of our native plume birds, and even the ugly and unamiable alligator may greet the eye of the traveler on our rivers and our fresh-water lakes.

The non-resident tax will help to accomplish this end. If in addition to exacting a license fee we had the game-tag coupon system to restrict the amount killed by an individual, that would be better still. This Mr. Shields, I hear, is the president of a league of American sportsmen. If there are any members of the league who are ambitious in their humble way to emulate the exterminatory peregrinations of their president, we would do well to charge them double price or shut them out altogether.

DIDYMUS.

CHICAGO AND THE WEST.

Ate Quail in May.

CHICAGO, Ill., May 27.—The annual banquet of the St. Louis County Medical Society was held at Duluth, Minn., a week or so ago, and the management intending it to be a rather swell affair, offered as one item that of "larded quail." Among those present was one Dr. T. D. Titcomb, who said that he did not think it was right to serve game in that way out of season. He did not eat his quail, but wrapped it up and took it away with him, declaring that he would have suit brought against the house. He was dissuaded later from taking this course, but made request through the city attorney to the hotel, asking them to serve no more game out of season. Now, the odd part of this whole thing is that other members of the Medical Association are very much scandalized by Dr. Titcomb's action, and say that he was very wrong to make a row over such a little thing as Bob White quail served in the month of May. The Association intends to pass a vote of censure for the man who seems to have been about the most decent of those present. It would appear that the lawyers of St. Louis county ought now to hold a banquet and pass a vote of advice for the use of the doctors.

Deer in May.

I am in receipt to-day of a letter from Brule, Wis., which would indicate that human taste in the cold Northwest now and then hankers after deer as well as quail, and is not particular about the season. My informant says, "The game laws in Douglas county, Wis., are as nil. Deer are killed at all seasons if a settler wants meat, or a sportsman thinks he needs venison. A buck was killed near Lake Nebagamon last week, and two sportsmen went up to Brule last Sunday night with rifles and jack lights."

Hunting Knives.

Mr. J. S. Jouett, of Washington, D. C., writes me on the always entertaining topic of hunting knives, going on to say: "The blade of your knife is right, at least that is my opinion. I send tracing of my knife blade, which I had made and used for five years in New Mexico, and it is the finest steel and most perfect temper I ever saw, and I have been a big game hunter since 1875 in Texas, Arizona and New Mexico."

The outline of the blade sent by Mr. Jouett shows what seems to me a very serviceable and stout looking point. So far as skinning is concerned, it is all in the point, of course. I don't know when the knife will see daylight which my friend and myself figured out, but I should think the knife might be a useful one, though very unpretty. As to the temper of knife blades, I feel

obliged to state that the temper of the blade of the hunting knife sent to me by Mr. Philpot, of South Hanover, Mass., is the finest that I ever saw in any piece of steel. I like to wear a belt knife when I am out in the woods even on a trouting trip, and I think I shall wear this beautiful one whenever I go trouting hereafter. It will cut a feather or a tree, just as you like. When I was fishing the Prairie River this spring my companion pointed out a little tree which hung out over a pool. He said, "I have been wanting to cut that thing away for a long time, but I never have an axe along. It always spoils the fishing of that hole under the bank." I gave him my knife, and he waded over and cut off the big stem, which was over 3 in. through, with perfect ease. "Where on earth did you get that knife?" he asked me when he came back. "It certainly is a cutter."

I notice that the maker of my knife states that he doubts whether any knife will cut open a can of beans, and still remain keen enough for skinning game. This is, of course, true, though his own knife goes far toward refuting the statement. The big Hudson Bay knife will chop a can of beans in two, but its edge is thick and cleaver like, and the weapon is too heavy for use in skinning anything but very large game, and even at that work a smaller blade would far surpass it. The temper of a knife is the same as the disposition of a man. I have some knives which are tempered so hard that they are almost useless, whereas the ordinary butcher knife is so soft that it is good for very little but skinning purposes.

Personal.

I have located Noel Money at last, but he will not hold still very long. He is now in Montana, but is going to visit Colorado, Utah, Idaho and the Yellowstone Park; was thinking of going back to England by way of Siberia, but admitting that it might be a little cold next winter, thinks he may come back East during the fall. There have never been any who might justly accuse Mr. Money of cold feet.

Major Dabney, of Clarksdale, Miss., otherwise Coahoma, of FOREST AND STREAM, paid this city a visit all too brief one day early this week. So far as I can discover, Coahoma remains unregenerate in the matter of his fondness for snakes. I hope he will spend more time in Chicago the next time he comes here. I want to ask him about a few things which I forgot. I had a dog once which was bitten by a snake, and his face swelled up. Now, was the pup merely letting on that the snake-bite hurt him, and was it all in his mind? Answer me this, oh, Coahoma!

Mr. Platt Adams, of New York City, leaves to-night for his home in the East, after a stay of about a month in Chicago with his brother, Mr. A. W. Adams. Both are gentlemen very fond of the gun, and no novices in its use.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

Digging out Foxes.

Editor Forest and Stream:

In FOREST AND STREAM of May 27 B asks about who is thought of digging out a fox after being holed by a dog. My advice to all who wish to get a fox in this manner is, don't. Let him alone for another run. In the years in which I have been hunting foxes in our New England manner, I have holed a great many. Now and then I have dug one out, but not during the past winter, when my dog holed ten. One fox we did try to dig out. A friend was visiting me who had never shot a fox, and I think I can safely say he never will under ordinary conditions. My dog holed one quite near my house, and we planned to dig him out and let my friend shoot him; but although such was our intention, we failed to reach the fox after some hard work. I think I know just how to get a fox out of any ordinary hole without much digging, but I do not intend to tell how it is done, as I do not believe in getting a fox in that way.

While on a trip after moose in Nova Scotia I was told by one of the men in our employ of how they snared foxes in the Province, using three strands of fine copper wire. I tried this on two foxes my dog holed one day. The foxes did their part; that is, they both poked their heads through the noose; but when they found they were fast they bit the wire off and got free.

Trapping wild animals of any sort when using steel traps, unless traps are so set as to drown whatever is caught, is the most cruel manner of killing anything. I know one man in this locality who wants any and every fox he can possibly get. When he holes one he puts in a number of steel traps and fastens the entrances to the hole, and I have known of his keeping a fox shut up in this way for three weeks, and when it was finally caught it would be nearly dead from starvation.

A few years since we had a sort of half-way law passed to prohibit the trapping of foxes. Like all such measures, it has proved a failure. Last winter I met a man, a stranger to me, in a gun store in Boston, and as something was said about foxes, he said he had just sold quite a number of skins and that he did not fool away his time hunting them, as he could get more of them and much easier by trapping. This man said he came from New Hampshire and that he lived in the same town as one of our State Fish and Game Commissioners.

Protection of all kinds of birds and animals in New Hampshire is not what it should be. The prohibition of the sale of game at all times and in all places, according to the doctrine of the platform plank of the FOREST AND STREAM, failed to pass the Senate in our last Legislature, because the manager of a certain hotel, who either was in or had influence in the Senate thought it would interfere with his serving game now and then to his guests. I tried to interest our game associations in the necessity of adopting the plank, but although at their meetings they voted to adopt the same, they apparently did nothing more and the market hunter still has his way. During the past winter I saw in a Boston daily paper a rather sarcastic allusion to the game laws. It was then considered advisable by many to exterminate the English sparrow, and the article in question said that the best way would be to make the sparrow a game bird and pass game laws for his protection, and that by so doing his extermination was assured. Verily, under the

present outlook we might as well adopt a measure which was proposed in our last Legislature to the effect that all game laws be abolished, the Fish and Game Commission be ended, and everyone kill everything they could at all times and in all places.

C. M. STARK.

DUNBARTON, N. H., May 26.

"Types of Sportsmen."

WASHINGTON, D. C., May 29.—Editor Forest and Stream: As a constant reader of your paper, permit me to say a word regarding the stories of Mr. W. W. Hastings. He beautifully portrays the true "Types of Sportsmen," and anyone, after reading his No. 3, would not belong to the true class if they "ridiculed" him for so appealingly portraying his great affliction. While I sat reading it, the wings on memory carried me back to my old Virginia home, where I spent the happiest and saddest days of my life. Returning home from a grand fox hunt on my faithful old friend Rod, I was met at the gate by my sister, who whispered to me, "Madge is dying." I could not understand what she meant, for I had left her in the morning bright and happy, and singing my old favorite, "'Twas twenty years ago." During my absence she had met with an accident, and she now sleeps beneath a beautiful willow in front of my old home. Every year I make a trip, just to be near her. I shall ever be faithful to the one who once welcomed me, and give her often a place in my thoughts, as I know I was ever in hers. It is so rare to meet noble hearts and true friendship that sympathy, from no matter what source, is a treasure; it is the purest pleasure I have. I have come to look upon death as a temporary separation, after which the reunion will be happier. I hope Mr. Hastings agrees with me.

RODERICK.

Mr. Harry E. Lee in Alaska.

We were much pleased to meet Mr. Harry E. Lee and wife, of Chicago, Ill., who spent several days in our city recently. Mr. Lee is one of the most noted crack shots and sportsmen of the United States, and has a large and valuable collection of specimens brought down by his own gun. Last year he spent several months on the Kean Peninsula, and secured some valuable specimens. Mr. Lee is not alone this year, but just before leaving Seattle took unto himself a very charming wife, and they will spend their honeymoon in the wilds of Alaska. They have the best wishes of the Alaskan for their future happiness.—The Alaskan, Sitka, May 13.

Camp-Fire Flickerings.

"That reminds me."

THE Indians of Mexico know nothing of the laws of contagion. They display an apathy toward certain loathsome diseases which surprises a foreigner.

In a recent hunting trip in the Sierra of Puebla, our party of eight was descending toward Zacapoaxtla. We rode leisurely, for the trail was narrow and hemmed in by Indian huts. At the door of one of these stood a woman and a little girl. We stopped to inquire the way, when the following conversation took place:

"Good morning, Señora."

"A very good morning, at your orders, Señor."

"This is the road to Zacapoaxtla, is it not?"

"You are quite right, Señor."

"And is it very far?"

"On the contrary, it is but a very little ways."

"A thousand thanks for your kindness, Señora."

"There is nothing for which to offer them, Señor."

"Is the little girl sick, Señora?"

"She is a little sick, Señor."

"What is the matter with her?"

"She has the smallpox, Señor."

"Ah, good-day, Señora."

WM. S. SPENCER.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Chat of Boston Sportsmen.

BOSTON.—Office of Massachusetts Fish and Game Protective Association, May 29.—Editor Forest and Stream: I will jot down a few happenings hereabout that will, I think, be of interest to many of the live sportsmen who read your valuable paper. One of the jolliest parties that seeks recreation outside the limits of our own State is known as the Hopewell Club, named for Mr. Frank Hopewell, who has been for many years an earnest member of the Massachusetts Fish and Game Protective Association. The Hopewell cottage is located on Great East Lake, which is partly in New Hampshire and partly in Maine.

Members of the club returned a few days since, bringing a hundred pounds or more of black bass. Besides Mr. Hopewell, there were in the party Dr. E. W. Bränigan, A. J. Selfridge, Dr. M. A. Morris, Messrs. W. B. Hastings, Thomas H. Hall, W. L. Henry, C. S. Clarke, R. V. Joyce, A. A. Glasier, E. L. Pillsbury and Mr. Mertz, all of Boston, and Messrs. Dexter and Haskell, of New York, and others.

They report excellent success in taking bass from 3 to 6 lbs. in weight, and as many as they cared to catch. The members who went from Boston were joined by the Goodall brothers, the well-known plush manufacturers of Sanford, Me. My classmate, Col. Ezra B. Parker, of Boston, has just returned from West Waterford, Vt., where he succeeded in capturing a fine string of trout, and met an adventure which he had not expected. While fishing from a bridge, the plank on which he was standing gave way, precipitating him head foremost into the pond below, where the water was several feet over his head. The Colonel says as he found himself drifting down toward

the dam below, he realized that it was work or drown, and he "thought he better not drown then."

Three Boston devotees of the rod and reel—Dr. J. T. Stetson, Dr. Heber Bishop and Mr. W. S. Hinman—all loyal members and officers of the old Massachusetts Fish and Game Protective Association, started for Rangeley last Saturday morning for a three weeks' outing. They will go in by way of Kennebago Lake to Ed. Grant's camp at Beaver Pond, and other portions of the Megantic preserve, and spend some time at Dr. Bishop's cottage in the Kibby Valley.

As regards legislation in our State, the marketmen failed to secure an open year-round season for the sale of quail at the present session, although they made a vigorous effort to secure it. No very important changes in game laws have been made. The Committee on Fisheries and Game was composed chiefly of new members, and of the most conservative sort.

This committee reported against the Talman bill for reorganizing the State Board of Commissioners, and the establishment of a board of six members to serve without compensation, and to employ an executive officer on a salary. Some amendments were made to the original bill in the House, and the amended bill was passed by the House, but was defeated by a small majority in the Senate. The terms of Chairman Brackett and Commissioner Young will expire next October. Whether Governor Wolcott will reappoint them or not will be known before many weeks.

The affairs of the Association are in a flourishing condition, and its work in providing members with quail to be liberated, has attracted considerable attention. At the meeting on May 19 at the Copley Square Hotel, reports were received from about a dozen of those who had received the birds, most of which were very satisfactory, indicating that only a small percentage of them were lost.

Some of these reports were of great interest and importance, as they gave details as to the methods of handling, and caring for the quail.

A letter received from Mr. A. B. F. Kinney, President of the Worcester County Game Protective Association, states that that organization "has liberated seventy-five dozen Kansas quail without the loss of a bird, and Mr. Kinney says "we get word from some of them every day or two, are lively and doing well—all liberated last month." Mr. Kinney has become a member of the State Association, and has been elected a Vice-President. The President of the Fitchburg Rifle and Gun Club, Mr. H. A. Estabrook, has also been elected a Vice-President of the State Association.

There are quite a number of active protective organizations in Massachusetts, and we hope before long they will all become vitally connected with the parent Association.

I believe, Mr. Editor, that your paper can serve the cause of game protection in no better way than by demonstrating to the sportsmen and all lovers of birds and animals the importance of combined action. Let there be formed fish and game leagues or societies in every important town and city. Let those who are interested get together and have an interchange of ideas on the many subjects connected with sportsmen's interests. Let these local associations look after the interests of their immediate neighborhood and at the same time place themselves in touch with sportsmen in other sections. One such organization is located in East Weymouth, Mass., where the smelt fishing is the paramount interest. Within a very few years the society has grown to a membership of 175, and it is widening the scope of its work all the time. Others might be named, not only in our own State but elsewhere, that are not only improving the care of game, but are exercising a great educational force in their communities. Let the good work go on until every public official who is called upon to make or administer laws shall feel the influence of a constituency of intelligent sportsmen.

HENRY H. KIMBALL.

A Tame Seal.

MANY years ago, before the great River Moisie was resorted to by cod fishermen and others, the harbor seals used to come up the stream in great numbers for the purpose of bringing forth their young in its quiet upper pools. After staying with their young for a couple of weeks, the mother seals would return down the river, and a few days later the little baby seals would drift down with the current and be carried out to sea, there to hunt and grow big, and in their turn become father and mother seals and visit their native river.

Many a calm evening I have stood on the gallery outside the house and listened to the infant-like cry of the poor little seals as they drifted on the river past the post. One evening, toward the end of "the run" we heard one crying in a most pitiful and heart-rending way. Every now and then we could see the snow-white little mite as he floated on the surface near midstream.

I got a large salmon scoop and joined the man on the beach. We waited till the seal had floated past us, then quietly pushed out the boat. The man headed obliquely down stream to come up with the baby from behind, while I took a position in the bow, ready to land it in the boat. In a few minutes we were up to him. The poor little deserted fellow was pawing about in the water much after the manner of a blind puppy and uttering plaintive cries, startlingly like a real baby. I slipped the scoop well under him, and in a moment he was safely landed in the bottom of the boat.

I fixed up an extemporaneous feeding bottle, made of a piece of rubber tubing, a cork and an empty soda water bottle, which we filled with some nice warm milk. We got him comfortable on a sheepskin alongside the kitchen stove, and with a little instruction he very soon knew how to work his end of the tube. The warmth from the stove and the bottle of milk very quickly sent him into sweet forgetfulness.

My first intention was to keep him only a few days, until he got a little larger and stronger, and then let him continue his journey to the sea. But the little fellow became such a pet and evidently liked his surroundings so well that it would have been heartless in the extreme to send him away; so Jack, as the cook christened him, became one of the family, and grew and waxed strong, and followed me about between the buildings with his flopping gait in a most ridiculous manner.

In September, numbers of fine sea trout used to come in the river each tide and go out with the ebb. We placed a stand of old useless salmon nets near the last sand point to create a back-water, from which to fly-fish. Jack used to accompany me on these fishing tours, and he very soon came to understand what my whipping the water was for.

One day he wobbled down to the very edge of the river, gazed up and down and across the water, and the next instant dived in, with a greasy, sliding motion. The waters closed over him, and I paused in my pastime to see what would happen next. I looked about in all directions for Jack, but not a ripple disturbed the placid waters. He could not have been meshed in the folds of the net, because I would have seen the floats vibrate. So I stood there pondering, my thoughts partly perplexed and partly sorrowful for the possible loss of our pet.

All at once I heard heavy breathing almost at my feet, and looking down, there was Jack with a fine 3½lb. sea trout crossways in his mouth, which, on my calling his name, he deposited at my feet. Then you may be sure I petted the dear young fellow, and he seemed to understand that what he had done was appreciated by his master, for after rolling himself for a few moments on the sand he made another dive, and another, and another, always with the same successful results, and the best part of his fishing was that he only selected the largest and fattest fish. We went home, both very proud in our own way—Jack for having been made so much of, and I because of the useful accomplishment of my pet.

As long as the run of fish continued, Jack and I used to resort each day to the eddy. He brought the fish ashore and I put them in the basket. What we could not consume at the house the cook salted for winter use. Yes, the winter was coming on, and the thought occurred to me several times what we would do with Jack. Jack, however, made no attempt to take his freedom and forsake us. On the contrary, he manifested greater affection for us all, and, as the days became shorter and the nights colder and longer in that northern latitude, he used to sleep for many hours on a stretch, huddled up with the dogs in the kitchen, only going out of doors for an occasional slide in the snow once or twice during the course of each day.

Even the long winter of the North comes to an end in time, and once again we had open water; the fast-bound river was again free from ice, and Jack used to take long swims, but he always came back. Finally the run of salmon struck the river, and I took Jack down to the bight of the sandbars to fly him at bigger game than the trout. He made one or two dives and came ashore empty-mouthed. He saw there were no caresses for Jack, so he tried again.

This time his efforts were crowned with success, for he landed with a 12lb. salmon struggling in his strong jaws. He received my patting and expressions of satisfaction with unbounded joy and seemed to know he had done something to be proud of, for he ambled up the sandbank and slid down to the water several times in rapid succession.

Soon it was the season for the seals to enter the river as in past years, and the Indians were shooting them from their canoes whenever they had a chance. Jack used to go so far afield now, probably trying to find the mother that had so shamefully deserted him last year, that we feared he might be shot by the Indians by mistake; so we tied a piece of blue worsted gartering about his neck to distinguish him from the other seals. But alas for the poor Knight of the Garter. One day Jack was out among the other seals off the mouth of the river, and in some way the blue garter must have been detached from his neck, for an Indian shot him.

The man brought him ashore and told us of the mishap. As soon as he handled him to put him in the canoe, he knew at once from the roughness of his coat it was poor Jack. And thus ended our intelligent and useful pet.

We buried him near the flagstaff and put up a board bearing the inscription "Jack." MARTIN HUNTER.

ANGLING NOTES.

Truth Stranger than Fiction.

A SHORT time ago, in a moment of weakness, I consented to prepare and read a paper upon the history of artificial fish propagation before a natural history society in the city of Albany. I say moment of weakness, because at that time the date fixed upon for the meeting of the society seemed so far away I thought I could easily find the time to prepare the paper; but as it drew near and the paper was unwritten, I realized how rash I had been in making the promise, and I determined that never again would I allow myself to make such a promise unless the paper was written in advance.

My promise was kept, however, and on the evening in question as the people were gathering in the audience room and I was talking with members of the reception committee in an adjoining room, one of them, a very charming woman, well-known in the educational world, said: "I hope you have some fish stories in your paper for the entertainment of this large audience, for many of them are not members of the society."

In reply, I said: "Madame, I do not know any fish stories, if by that term you mean the exaggerated tales of fish, fishing and fishermen, told in some of the newspapers by people who know nothing apparently about the subject, and whose chief aim seems to be to make the tale as improbable as a fertile imagination can conceive of, but I will tell you now of the experience of a gentleman that I knew. Dr. W. W. Aldrich, a practicing physician residing in Weverton, Warren county, N. Y., was fishing in the Kungamuck stream in the Adirondacks for trout, and caught a fish with something sticking to its body near its tail, which proved to be a one-cent United States postage stamp. Mr. Gilbert Sheffield, who was fishing with Dr. Aldrich, saw the trout taken from the water with the stamp adhering to it. The captor of the fish made no attempt to explain why or how the trout had picked up that stamp in the water of a wild Adirondack stream where postage stamps are extremely rare, even in the few cabins or log shanties found in that region, or why the stamp had not washed off in the water after the trout

had annexed it and before he caught it. He simply, when he told me of the occurrence, could not explain it." The lady said: "That is a most delightful fish story."

"No, madame, that is not a fish story in the sense you understand the expression; it is a plain fact which happened in connection with fishing, and if such facts as have actually occurred in connection with fish and fishing could be gathered together in a book, it would make a collection of true stories stranger than all the fictitious fish stories that have been printed since the landing of the Pilgrims."

"But do you believe that story about the postage stamp being found on the trout?" "Certainly I do. Both the gentlemen I have named are perfectly reliable, and would not make a false statement concerning the matter when telling it for an absolute fact."

"Well, how do you account for it?" "I do not pretend to account for it, and yet it might have been possible for some sportsman to have thrown an envelope or newspaper wrapper, on which there was a penny stamp, into the water, and the stamp might have washed off of the paper (for it was a stamp that had been cancelled) and come in contact with the fish and adhered to it because of the slime on its body. Had it occurred in the wilds of Canada there might have been another explanation, for a gentleman told me that he once fished for trout in Canada with postage stamps on his hook. In his case, however, they were red stamps, and he put the hook through the stamp and tied it down to the shank of the hook with the red outward to cover the shank and give the appearance of an artificial red ibis fly, and he said the trout took the postage stamp fly as readily as though the hook had been covered with red feathers instead of red paper; but it took a postage stamp for each fish, and the supply of stamps were limited." "I am inclined to think that after all you may know a very few fish stories, for certainly what you have told me are as interesting as any fish stories I have ever heard."

"Let me add, madame, that they have the merit of being true. Call them what you may."

Later in the evening, after I had read the paper, another lady remarked to me: "Some of the things you said to-night are most surprising, for instance, that shad have teeth until they are about a year old, and thereafter have none; but the most astonishing thing to me is that flat fishes should first swim in a vertical position and have an eye on each side of the head, and then swim flatwise and the under eye should travel around the head until both are on top of the head." "You accept both as statements of facts, do you?" "Most certainly, for you have simply declared what has been observed as perhaps a strange possession of nature, and while new to me, and so astonishing to me, it is not at all improbable, for nature is mysterious in her ways."

Then I again told of the fish with the postage stamp attachment, and asked if it seemed to her improbable or impossible. She said not impossible, for it had happened; but in her mind it would come under the head of "queer," and when we were joined by the lady to whom I had first told about Dr. Aldrich's fish, I said I had a story for her. That a fish had been imbedded in a ball of clay, and clay and fish had been sent 12,425 miles and then the clay was moistened and the fish was found to be alive. There was a raising of eyebrows which I ascribed to astonishment rather than doubt, and I explained that the fish was a lung fish, and was sent from Calcutta to New York, and that Dr. Bashford Dean had softened the clay at Columbia University and released the fish, and when I saw it it had been alive in an aquarium in the university for a year.

The lung fish looks not unlike an eel, and is said to be very good eating. In fact, Dr. Dean advised that they be cultivated in this country. I have reached that point where I never doubt anything that may be said of fish that is curious or out of the way, because I have known of so many curious things concerning them that could not be doubted, that I prefer to be on the safe side and accept everything until a statement is proven to be inaccurate, for truth is often stranger than fiction artistically colored.

Fish Notes from Abroad.

At the meeting of the American Fisheries Society at the New York Aquarium in 1896 one of the most interesting papers presented, and one that caused considerable discussion, was read by Dr. Tarleton H. Bean, entitled "New Method of Pond Culture," it being a translation of an account published in France of a lecture by Dr. Jousset de Bellesme, relating to his experiments in rearing certain fishes confined in fresh water ponds, notably the California salmon, the rainbow trout and our native brook trout (*fontinalis*). The proceedings of the American Fisheries Society for 1896 may possibly be obtained from the Secretary, Hon. Herschel Whitaker, of Detroit, by any one interested in the subject of pond culture, as in it the lecture by Dr. Bellesme, as translated by Dr. Bean, is printed. Mr. S. Jaffé, of Osnabruck, Germany, has written me a letter which is in the nature of a postscript to the lecture referred to, and should be read in connection with it. Mr. Jaffé is one of the best known and experienced fish breeders in Germany, and his letter is in part as follows:

"I was in Paris last week consulting about the 1900 Exposition, and I took occasion to talk with Dr. Bellesme about his quinnat salmon. You know about his report on pond culture, for you mentioned it in the 1895 report of the Fisheries, Game and Forest Commission of the State of New York."

The fish (breeders three and four years old, 1 to 3lb. fish; two-year-olds, ½lb., yearlings, eight to the pound) in the Trocadéro Aquarium are very good and healthy, and curiously enough quite free from fungus, which had badly attacked some rainbows and *fontinalis* they had in the same water. The particular water (rather hard from the Paris limestone) seems to suit the quinnat, but I think much of the success is due to the great size and depth (fully 12ft. in depth) of the tanks. Dr. Bellesme assures me that he knows that the quinnat now breeds (going down to sea and coming back for spawning) in at least one river in Normandy. The quinnats we have here do well, the males (two years old) had plenty of milt, and the females are now forming eggs toward the third year, but the great drawback to the fish is the facility with which it loses its scales in handling, and altogether it seems to have less power of resistance in transportation than any Salmonidae I know of. Dr. Bellesme admits as much, and

I am afraid this will prove a serious drawback over here; however, we will see.

Rainbows still do wonderfully well; we now get nearly perfect impregnation by letting the water which envelopes the ova drop and remain in the spawning dish before milting, this water, of course, is not the water which is avoided in dry spawning, but the watery fluid which sustains the ova inside of the female.

The steelhead ova forwarded by Captain Dougherty, and sent over via Cape Vincent Station in Mr. Stone's care, arrived beautifully about fourteen days ago. Loss in hatching and transit under 720 out of 10,000 eggs, and I hope the fry, which are vigorous, will give a good account of themselves. The ova arrived packed on trays bottomed with strong bleached swansdown (canton flannel) and on which swansdown moss was packed. The ova were placed on the moss in single layers, and covered over with the usual coarse mosquito netting. Plenty of air space was provided between every tray by driving small nails, with about $\frac{1}{4}$ in. of their length sticking out, into each tray corner. I think this would be the correct way of transporting the *mykiss* ova too, and in view of this I have had the following equipment made here, as the *mykiss* ova develops so quickly, and your plan of hatching en route is still rather dangerous.

I have put freshly spawned and freshly impregnated rainbow ova, immediately after the washing and after the first white ova were picked out, on similar moss trays very thinly, omitting, however, the top mosquito netting and leaving the ova loose on the moss with $\frac{1}{8}$ in. air space next to the swansdown. The moss pads were well soaked before putting on the ova and the woodwork and swansdown was soaked for forty-eight hours before putting on the moss (I found this necessary as the woodwork absorbed too much moisture afterward if not so treated); the six frames were put on top of one another and a moss box (moss $\frac{3}{4}$ in. thick) added at top and bottom, moss well soaked. No ice was applied, and the ova was packed in an outer case with moss lining (not hay nor chaff, which would heat) 8 in. all around.

The ova were left undisturbed except for the closed box being sent by rail around about here and back several times, and then opened after twenty-four days, and the ova were found to be doing remarkably well toward eyeing, the loss in dead and fungused ova being small comparatively.

I understrapped (cotton ribbons nailed tightly across below the swansdown, crosswise), some of the frames to obviate the puddling of the moss, and these frames did best. Could you have a similar experiment made with some *mykiss* ova?

German fishculturists are very thorough with all these experiments, and this letter from Mr. Jaffé contains valuable information. Very recently I have learned that the Pennsylvania Fish Commission will not cultivate the rainbow or brown trout in the future. Our breeders have had much trouble in impregnating and rearing the fry of the rainbow, as compared with the ease that the eggs and fry of the native Eastern trout may be impregnated and reared, and the fish find greater favor abroad than it does in eastern Nova Scotia waters when brought from the Pacific slope. The *mykiss* (Rocky Mountain or black spotted trout) mentioned by Mr. Jaffé have been hatched in the East only in New York State, so far as I know, and they are a spring spawning trout like the rainbow. The Fisheries, Game and Forest Commission find no difficulty in getting an impregnation of from 90 to 95 per cent., but the embryo is apt to burst the egg just before hatching, and there is loss between the times of hatching, and the times of feeding, so there is a loss of 40 per cent. on such a matter.

From the Salmon Rivers.

If any one of the many vexing things in this life is more vexing than another, it is, in my estimation, to have two invitations to fish two of the best salmon rivers in Canada, and think about it during the winter, and when the season for salmon fishing comes, to be kept at home by "official duties." My physician (he is an angler, and an angler makes the best kind of a physician—for an angler) says that I am suffering for the benefits to be derived from a vacation on a salmon river, and I feel that he is right about it; but I have a conscience (what an entirely unnecessary thing a conscience is at times, when it rears up on its hinder legs and pricks your entire system so that no argument can knock it out), and that conscience has been wrestling with me for several weeks. Twice I have had it down, so that I thought I might get the decision, but it rose again, smiling, and as busy as a boy digging angle worms. Last year I knocked it out in one round when a telegram came to me saying the salmon were coming into the Ristigouche, and it did not recover until I was across the border in Canada, where I had it at a disadvantage, for my conscience does not understand Indian or habitant French. It has been a little weak this morning, since I received a letter from my friend Mr. Archibald Mitchell, dated at Runnymede, P. Q., on the Ristigouche River, May 30, which reads: "My son and I arrived here Friday last. The Matapedia bridge is half gone, not on account of a freshet, though the ice got jammed on one side, which made the current so strong on the other side that the water undermined the piers and carried part of the bridge down. We fished Friday afternoon, Saturday afternoon and all day yesterday (Monday), and have had all the fun we want beaching kelts and letting them go. I beached eight yesterday, all large and mended kelts, nearly if not quite as bright as fresh sunfish. I hooked one on one of his fins just above the vent, and he made lots of sport and crossed and recrossed the river, and we all thought it was a fresh-run fish for some time. They are not getting many salmon in the nets below yet, and there appear to be very few in the river although Mr. Falls killed a 28-pounder on the Goelet water yesterday morning, and a 40-pounder is also being reported as taken on the club water above Matapedia Saturday. On account of salmon being so scarce, we are going down to Tide Head to-day to try and get some trout fishing. We are the first fishing party on the river this year. You make a mistake not to see your way clear to have some salmon fishing this season. You will accomplish more in the long run by breaking away from your desk for a while and killing some salmon than by grinding at it all the time."

That sounds like advice that should be followed, and I know Mr. Mitchell is a man of good judgment and something of a doctor, for he can mend a reel or a rod and splice a fractured line and even make salmon flies. Since I have read his letter I have smoked several pipes over it and must confess that my thoughts have been less on "official duties" than on the last salmon I killed at Runnymede last year, a fish of 26 $\frac{1}{2}$ lbs., gaffed from the canoe, which gave me a fight so interesting that while it lasted if my conscience had roared at me through a megaphone I would not have known that I had it in the canoe with me. I am not sure, but this day seems to be not a good one for a conscience that cannot talk Kanuck to be prowling around.

A. N. CHENEY.

Fishing on Posted Streams.

POTTSVILLE, Pa., May 27.—*Editor Forest and Stream:* For many years it has been a disputed question whether it was possible to prevent fishing in private or preserved streams in this State, and it may interest you to read the result of a case just tried in Monroe county. I inclose you Judge Albright's charge to the jury, and the circumstances of the case as reported by the Monroe Democrat. The case was tried at a special term of the Civil Court, Judge Edwin Albright presiding. W. D. S.

For several years there have been in existence in this county a number of fish and game associations, which have purchased or leased many miles of streams and many acres of land for the purpose of the preservation and propagation of fish and game. Their right to forbid hunting or fishing on their respective preserves has been questioned, and especially so with respect to the right of all persons to fish for trout in the streams in which the State had placed trout fry. Articles have been published in some newspapers to the effect that the Supreme Court had decided that this right could not be abridged, and the various fish associations could not prevent fishing in their streams if fish from the State hatcheries had been placed in them. Everywhere throughout the county the subject has been discussed and many people are honest in their conviction that they have the right to fish in any stream for which fish commissioners have furnished fish.

Consequently the several cases for trial in court this week were of more than usual interest. These suits were actions in trespass against John Ely, William Seiple and Joseph Delp, all of Northampton county, for fishing and taking trout in the McMichaels Creek in Chestnuthill Township in April, 1898. The actions were brought by the Pohoqualine Fish Association, the owner of about six miles of this stream, and upon which the fishing was done. The court, Judge Albright presiding, began consideration of the three cases, which were tried together, on Monday noon.

The Fish Association was represented by Messrs. Storm and Palmer, while Messrs. Staples and Erdman represented the several defendants.

The several witnesses for the plaintiff showed that each of the defendants had been fishing in the stream, and had taken fish therefrom. They also testified that sixty-three printed notices were posted along the streams showing them to be private, that the fish warden told the defendants the stream was private and fishing was forbidden and Wardens Haney and Siglin threw stones in the stream to prevent any further catching. It was also testified to that the defendants left the stream at about noon, but in the afternoon again returned and resumed fishing and endeavored to bribe the wardens who were persistent in their efforts to prevent their fishing. The Association further showed that it had expended large sums of money in the propagation of trout.

The plaintiffs completed their case on Tuesday forenoon, when the defendants' counsel moved a compulsory non suit, which was refused by the court. Mr. Erdman then opened for the defense. The position taken by the defendants was that the plaintiffs were entitled to nominal damages. The ownership of several miles of the stream by the Pohoqualine Fish Association was admitted as well as the fact that they, the defendants, had been guilty of trespass. They also admitted that in the event of the defendants having gone on the stream wilfully and maliciously then the plaintiffs were entitled not only to nominal, but also to punitive or vindictive damages. They, however, maintained that such was not the case. They offered to show, in order to avoid punitive damages and show their innocence of wilful entering and trespass upon the lands and streams of the Association that for some time the rights of fishermen had been agitated and somewhat in doubt, that they had seen an article in the Times which led them to believe that they had a perfect right to fish in any stream which had been stocked by the State with trout, that they had consulted two attorneys of Northampton county, who had advised them that they had a perfect right to fish the stream provided they waded the creek, that fully relying on this advice they actually believed they had a right to fish, and on that account persisted in fishing even after they had been warned off by the warden. A portion of the above evidence, the Times article, was not admitted by the court, the court not being of the opinion that newspapers were safe advisers in legal matters.

The several defendants were then sworn and testified virtually to the above facts, and denied having gone into the stream to make a test case.

An attempt made to show that Justice of the Peace D. M. Haney had informed the defendants that according to law they had a right to fish in that stream was ruled out.

Hon. Nathan M. Lesh and others testified that they had placed trout fry in the stream about three-quarters of a mile from where the defendants fished. The defense closed at about 3 o'clock.

In his charge to the jury, Judge Albright called their attention to the several kinds of damages from trespass, and fully defined the rights of property owners. As there are a number of facts of interest in his charge, and permission has been given us to print it, we give the main points below.

The jury found the defendants guilty of trespass, and nominal damages of one dollar each was placed on the defendants, and also one dollar each vindictive damages.

In regard to the costs, it is very probable that they will be placed upon the Wind Gap men, although the matter

will be determined at an argument court. The law is that where the court will certify that the trespass is wilful and malicious, the defendants must pay the costs. In this case the judge charged the jury that if it found the defendants guilty of wilful and malicious trespass they must find the damage more than one dollar, which was done.

The Pohoqualine attorneys asked the court to make the certificate that the trespass was wilful and malicious. The defendants' attorneys moved against it and an argument will follow.

The amount of the costs will be in the neighborhood of \$150.

Judge Albright's charge to the jury covered the following points of law:

In each of these three cases the plaintiff seeks to recover damages from the defendants for the alleged trespass on the plaintiff's property. It appears that the Pohoqualine Fish Association is a corporation enacted under the laws of Pennsylvania in the year 1894, and it appears that shortly after that they acquired by purchase, and by lease a right to the stream known as McMichaels Creek in this county, and an ownership of a strip of land on each side of the stream for some four or five miles.

Both this corporation and other persons put in trout that were hatched artificially. It appears that above the holding of this corporation the stream extends a number of miles, and it extends for miles below their holdings, and the fish were not confined on the company's property. They could go up beyond it and down below it. It is not a case of fish confined in a stream which belongs to a single owner, nor is it a case of fish in a pond. The fish themselves under the conditions we have to do with here are not the subject of property; they are considered to be wild creatures like bees in an undomesticated state, rabbits and other wild creatures.

The defendants in April, 1898, fished in this stream where the company owns it. Each of these three defendants has testified that on a certain day in April they went together and intended to go to this stream and fish and did go there. They entered the stream and each caught some fish. They fished in the forenoon and afternoon of that day. The wardens employed by the company say they told them they had no right to fish there, but that the defendants continued to fish, saying they had a right to fish, and then the wardens, in order to prevent them from taking any or many fish, threw stones and sticks in. The result was that each of the defendants caught, took and carried away several fish, and for that alleged unlawful act the company has brought these three actions. This is not an action or prosecution brought for a violation of the fish laws. It is simply an action of common law trespass brought by one man against another, who it is alleged unlawfully entered upon his land.

At this point the Judge gave some general directions as to the duties and powers of juries.

These defendants admitted that they waded the stream belonging to the plaintiff, and they fished. That constituted a trespass. One who intentionally enters upon the lands of another, when there can be no pretense that it was accidental or unintentional or necessary, commits a trespass; and when a party goes upon your lands or any other person's land, insisting that he has a right to go there, and particularly when he persists in remaining when he is warned off by you or your servants, he commits a trespass; and when he is such an intruder he becomes a trespasser, and it is the right of a citizen to have that declared. It is all the same when in passing from the land of another you walk upon the land or in the stream, it is a trespass, and the excuse set up by the trespasser, that they thought they had a right to fish there does not affect the question of right. It does not affect the question as to whether they were trespassers or not. If you have a stream flowing through your land with fish in it, or if you have a flock of chickens, and some one comes and insists upon fishing in your stream, or taking your chickens, it is no defense when you sue him for trespass, if he says he thought he had a right to fish in your stream, or take your chickens, inasmuch as some lawyer told him that. So in each of these cases the plaintiff is entitled to recover.

In every action of trespass where it is found that the defendant is in the wrong and the plaintiff is in the right then the plaintiff must be awarded at least nominal damages; that is, some small sum to indicate that the plaintiff was adjudged to be in the right and the defendant in the wrong. Such nominal sum is some small sum. We say to you that you can treat \$1 in each case as nominal damages, to which the plaintiff is entitled, and that in each of these cases you are to return a verdict for plaintiff for at least \$1.

In addition to such nominal sum, in actions of trespass, where the plaintiff prevails, he may be entitled to further sum as compensation for what he lost or for the injury that he sustained. In this case there was no damage done, as it is not said they spoiled anything of plaintiff's property, and consequently we say to you that as compensation the plaintiff is entitled to nothing, beyond the \$1, so far as we have presented the matter to you. They took fish which were of value, no doubt, but inasmuch as there was an open stream these fish were wild creatures, which one person had as much right to as another. Therefore, we say to you that you cannot give plaintiff any sum as the value of the fish as compensatory damages.

The question remains, gentlemen, as to whether you shall add to the \$1 nominal damages in each case a further sum in the nature of vindictive or punitive damages. In an action of trespass where the charge is some wrong and it appears that the wrongdoer acted oppressively or outrageously, and with a high hand, or recklessly disregarded the rights of another, or that he warily disregarded another's rights, then a jury, after awarding nominal damages, may add punitive damage as a proper punishment of the defendant, and in such a case, when the plaintiff prevails, and such ground for further vindictive or punitive damages is not shown, then no such damages shall be given.

Defendants' counsel here has not taken the ground that you shall find a verdict in favor of the defendant. He had too much regard for you to mislead you, if he could into the disregard of your duty and to find a verdict against the law and against the right, but insists that you ought to stop at nominal damages, \$1 in each case. The plaintiff insists that under the circumstances

as they are apparent here, there ought to be a sum beyond the \$1 awarded as punitive damages.

We say to you, gentlemen, that if you find that the acts of these defendants, or either of them, were high handed, and that knowing they had no right there, and after they knew they had no right there, if they defiantly, knowing they were in the wrong, persisted in fishing and intended to brave the thing out, or if knowing the rights of the plaintiff knew they had no right there, they wantonly commenced to fish or persisted in fishing, then there is such a case presented to you which will warrant you in adding to the \$1 such further sum as in your opinion would be just punishment for them.

When it comes to a question with a jury as to whether a person did what he knew was wrong, then his opinion and intention may be considered, and when it is a question of law and he in good faith goes to a lawyer, and fully and fairly states the whole case to the lawyer and the lawyer advises him, then it is taken that he may follow the advice of the lawyer, even if the lawyer should be in the wrong, and it is not to be imported to him that he did what was intentionally wrong. The lawyer's advice may be considered when the jury, after awarding nominal damages, come to consider whether a further sum shall be given against the defendants for punishment. Then, as to what the defendants believed what they were told, may be considered by you and you may also consider the matter as to what they were told when they came on the ground, whether they were not then given to understand and did understand that they had no right there, as to whether they persisted right or no right. All these things you will consider when you come to pass upon the question whether you shall award a further sum beyond the \$1 in each case as damages, and if to be awarded, then how much. If you award punitive damages you will fix such sum as you deem to be just, regarding the rights of plaintiffs and also of the defendants.

If a corporation owns a stream its rights are the same as if a dozen farmers owned that same stream; and if the corporation forbids fishing, its right to do so is the same as if a dozen farmers owning the stream should say there should be no fishing, and if people persist in fishing on our private property we will sue them for trespass. And the situation of this corporation is the same as the different individuals who are owners of the stream several miles above and below their holdings.

A man who owns land through which a stream flows for a mile has the same rights as another through which the stream flows for 100 yds. or 100 ft. You could not say that the man who owns the stream for 100 yds. may recover damages for fishing against his will in his stream, and the man who owns the stream for a mile should have no damages.

And so, gentlemen, we instruct you that under the facts in this case as it is conceded and admitted by the defendants in each case the plaintiff is entitled to at least nominal damages, which we say shall be taken at \$1. We fix that sum in order that if you go beyond that sum in your verdict it may be known whether you inflict punitive damages, and if it is not shown that the defendants acted in wanton disregard of the plaintiff's rights defiantly, and against their knowledge of their rights did what was wrong, then you will stop at nominal damages. If it is true that they thus defiantly and wantonly acted, then you may add such sum as may seem just to give in each case.

Banner Year for Trout.

If the season of 1898 was one of the most disappointing that the trout fisher has ever experienced hereabouts, he may obtain ample compensation this year for the lack of sport in the past. To say that the fly-fishing in northern Quebec has opened auspiciously only half expresses the truth. From all parts of the Lake St. John country come reports of magnificent and in some cases unprecedented success in fighting the fontinalis of these far northern waters. The usual large trout from Lake Edward are now coming in every day. Messrs. J. T. Lavallee and J. A. Delisle, of this city, arrived here a few days since with forty-seven of these trout taken by them, and weighing 125 lbs. Of the six best of this catch, the heaviest turned the scales at 5½ lbs., and the smallest registered 4½ lbs. Other corresponding catches are reported from the same vicinity. Mr. D. S. Rickaby, at the Iroquois Club, captured with the fly in two hours eleven trout ranging from 1 to 2½ lbs.

Thursday night's train brought here a number of very successful anglers, who have been fishing on their waters at Lake Kiskisink. Some of the more successful of these gentlemen are Messrs. William D. Bishop and K. S. Hincks, of Bridgeport, and Mr. Geo. H. Wilcox, of Meriden. They are enthusiastic about the splendid sport enjoyed by them. They report fish large and plentiful and rising ravenously to the fly. Another large party of members of the Metabetchouan Club have also returned home with big catches. It included F. N. Benham and J. P. Warner, of Bridgeport; Samuel Dodd, A. Chamberlain, William B. Ives, C. P. Bradley, Jno. W. Coe and W. R. Hall, of Meriden; J. Bury Peets, of New Haven, and William P. Morgan, of San Francisco.

Quite a lot of lively sport with 1 to 2 lb. trout in the present cold waters of this club's territory is also reported by Major Bailey, of Washington; Marcellus H. W. Page, of Newark, N. J., and Geo. Wilcox and F. Stevenson, of Meriden. Dr. Porter, of Bridgeport, and a friend have been enjoying some of the brook trout's lively struggles, on his new territory west of the Metabetchouan Club's limits, and several members of the Triton Club are prolonging their stay on their limits beyond what they had intended, in consequence of their unusually good success with their finny foes.

A number of members of the Laurentian Club are now up on their waters in the St. Maurice district, including Dr. W. H. Drummond, of Montreal, who has for his guest Major Drummond, of Ottawa, Military Secretary to Lord Minto, Governor-General of Canada. American members of this club are now able to take advantage of the new railway line to the St. Maurice from the Lake St. John country, and so cross over into this territory and fish for trout and quananiche on the same trip.

Quananiche are at present very plentiful in Lake St.

John. Several good catches have already been made at the mouth of the Metabetchouan, and in one day at the mouth of the Ouiaichouan, Mr. Frank Ross, Jr., of Quebec, took no less than sixty. The fish so far are not large, but there is, of course, the prospect that the usual heavy weight ones will make their appearance in the Grande Décharge when the fishing opens there, which from present appearances, will be about the end of next week.

Salmon fishermen are flocking down to their respective rivers. I. H. Stearns, of Montreal, passed here on Wednesday, going to his preserve at Chamberlain Shoals on the Restigouche. Messrs. Toland, of Philadelphia, and Edson Fitch and Veasey Boswell, of Quebec, left here yesterday on the specially chartered steamship Lord Stanley, for the Moisie. Surgeon-Major Nicholson, of India, is on his way here from England for salmon fishing, and Lieut.-Col. Andrew Haggard, D. S. O., is expected back from Japan very shortly to measure his strength and agility again with Canadian trout and ouananiche.

Some little excitement has been created here by the announcement of an opinion from the law officers of the Crown, to the effect that supposed owners of riparian rights possess no fishing rights whatever, except in cases where such rights were specially conceded by the Crown with the land itself. The matter will probably be tested before the courts.

E. T. D. CHAMBERS.

QUEBEC, June 2.

The Maine Waters.

Boston, June 3.—The interest of Boston sportsmen in fishing in Maine waters does not flag in the least. They go by nearly every train. Frequently every passenger over the Rumford Falls & Rangeley Lakes road, from Rumford Falls to Bemis, is interested in fishing, and the same is true of the Phillips & Rangeley road from Phillips to Rangeley. Such was the case one night last week on the former line, when there was a good car full of passengers. Interest in fishing is greatly on the increase, and the railroads and transportation lines are reaping the benefits. They may thank the newspapers and periodicals that have devoted a lifetime to spreading the delights of angling. Without the papers and periodicals the interest in fishing would die, from sheer want of being told about. Fishermen and novices are inspired by reading of the exploits—the successes—of those who do go, and they go themselves.

Some good catches are reported from Lake Auburn, Me. Mr. L. F. Chase, of that town, has taken a salmon of 9 lbs. M. L. Thayer has caught one of 8 lbs. weight; James Daws one of 8 lbs. 2 oz.; H. Richardson one of 8 lbs. Later Mr. D. C. Paine, of Lewiston, caught a salmon of 8½ lbs. from the same lake. Mr. P. O. Vickery, a gentleman much interested in fish and game, has lately returned from Great Pond, Belyrude, Me., with thirteen trout of from 2 to 5 lbs. weight. Mr. Jerome Marble, of Worcester, has made a record of a salmon of 13 lbs., taken near Senator Frye's camp, Mooselucmaguntic Lake. Mr. H. S. Kempton, of the Boston Herald, has broken his own record and that of some others. He caught a brook trout from Richardson Lake last Friday that weighed 8 lbs. He has fished those waters for many seasons. The same evening, Mr. E. S. Coburn, of Lawrence, Mass., caught a trout of a little over 7 lbs. weight. Mr. Coburn is naturally much pleased with his success this spring, since he caught a fine salmon a day or two before from the pool below the dam. The Robinson party made a fine catch of trout last Friday. Mr. Thomas F. Strange, of Boston, caught a trout of 3 lbs. 2 oz.; Mr. T. F. Saff, same city, two trout of 3½ lbs. each; Mr. G. M. Robinson, Boston, a trout of 3½ lbs.; James F. Brennan, Peterboro, N. H., a trout of 5½ lbs. The total catch of the party for that day was 40 lbs. That was a great day for fishing, and one of the best for the season thus far. Mrs. W. K. Moody, of the Camp Stewart party, caught several fine trout that day, including one of 4 lbs. The next day she made a record of six trout of good size. Mr. C. A. Stearns, of the same party, caught one of 3 lbs. the same day, in addition to one of 5 lbs. a day or two before.

Somehow the new hand—the greenhorn, if you please—always takes the best fish and the most of them. Mr. Fred Lambert, of Denver, Colo., assistant principal of the Edward Little High School, Auburn, Me., on his first morning out from Camp Stewart, Richardson Lake, became harnessed to a trout that gave him all the fun he desired. He was captured after a fight of some twenty minutes, and weighed over 4 lbs. Mr. Lambert took several fine trout afterward, but continues to delight in his first experience. Prof. J. P. Moody, of the same institution, caught a number of fine trout from Friday to Wednesday, when school duties called the gentleman home. Mr. Henry Porter, of Andover, Me., has taken a salmon of 5 lbs. from the same lake. Mr. N. G. Manson is at Camp Leatherstocking, on the same lake. He hooked a salmon the other day, but the rigging parted at the wrong moment. He did not regret the accident much, however, since he is to be in camp nearly all summer.

June 5.—Rod and reel sportsmen are coming and going, with more or less of success reported—more, if one reads the newspapers, and less, if one listens to the anglers who have returned. The H. T. Rockwell party is back in Boston, from Allerton Lodge. Fair success was with them, though sickness destroyed the pleasure of one of the number. The railway general passenger agents of several noted lines, to the number of nearly a dozen, have just been on a fishing and camping trip, over the Bangor & Aroostook. The party went by invitation of General Agent G. M. Houghton, of that line. From Norcross Station they were conveyed by steamer to Ambajelus Lake, and thence by canoes to the West Branch of the Penobscot. Eight guides accompanied the party, the small streams and waterways being fished. A record of nearly 500 trout was reported, the most of which were returned to the waters uninjured. The guides say that such fly-fishing they have never witnessed. Good reports come from the Northeast Carry, Moosehead region. The Tisdale party this spring comprised the following gentlemen: A. A. Tisdale, Leon A. Tisdale, Eddie R. Tisdale, E. H. Bates, F. W. Gray, G. R. Porter, H. P. Bassett, and Perry Stuart, all of Leominster, Mass. This club has for over a dozen years fished Moosehead waters; and last spring they built a permanent camp at the Northeast Carry. The best

day's catch reported by the party was made on the 28th, when Mr. E. H. Bates and Mr. A. A. Tisdale took forty trout—twenty-nine square tails and eleven lakies—in five hours' trolling. The brook trout averaged 2½ lbs. each, the largest weighing a little over 4 lbs. The day before breaking camp a handsome catch was made at the mouth of Norcross Brook, the trout rising to the fly in a manner which indicates grand sport in these waters during the month of June.

The Sperry party, of New Haven, Conn., came out from the Rangeleys, via Bemis, on Wednesday. Mr. Sperry has fished those waters for many seasons. He was accompanied this time by two daughters and a friend. They had good success, taking home a fine string of trout. Mr. C. A. Manson and son, of Boston, are beginners at angling in Maine. They took in one day's fishing, from Cupsuptic Lake, 50 lbs. of trout and salmon. They secured fish weighing 5½, 4½ and 3½ lbs. Mr. and Mrs. John S. Doane, of Boston, are at the Upper Dam. They have already secured several trout and salmon. Mr. H. W. Clark, of Boston, is at the Mountain View House, Rangeley Lake. This is Mr. Clark's thirty-fifth season at the Rangeleys, and he may well be termed a veteran angler. He has taken one of the largest fish yet secured from Rangeley Lake this year, a salmon of 8 lbs. Dr. Heber Bishop, Dr. John Stetson and W. S. Hinman, all of Boston, have gone to the Seven Pond region, where the fly-fishing season will open early in June.

From Moosehead come reports of early fly-fishing. The Linder party, composed of G. H. Linder, Charles H. Maynard and Garrett Schenck, all of Boston, are at the Linder cottage on Green Point. This is one of the oldest fly-fishing parties to the Moosehead waters; never fishing otherwise than with the fly. Good records are always in order with them. Nearly thirty members of the Night Hawk Club are at their cottages at the "Thoroughfare." They were joined Thursday by C. W. Diffin and E. J. Murch, of Boston. Mr. and Mrs. E. F. Gelleson, of Boston, are at the Lake House, and are making good catches, bringing in as many as 30 lbs. of trout one day. Dr. W. E. Baxter and E. S. Beck, of Boston, have been making trips over the lake, and have had good success fishing. J. H. Connor, of Boston, with Charles Bennier, of Leicester, Eng., have been enjoying the fishing at Moosehead. To say that the Englishman is pleased with Maine waters only partly expresses his delight. Fish and Game Commissioner L. T. Carleton, of Maine, in company with G. G. Downing and W. E. Parsons, have had good success at Silver Lake, making a catch of seven trout one day that weighed about 30 lbs.

Good reports come from Haine's Landing, Mooselucmaguntic Lake, with almost everybody catching trout and salmon. Senator W. P. Frye, stopping at his cottage at the Narrows, has caught a large number of trout on the fly. Mr. Pickard and daughter, of Auburn, Mass., and Mr. and Mrs. Roelofs, of Philadelphia, have been having their usual excellent success. They have been quartered at the Oquossoc Angling Association's camps. Geo. R. Moosler, of New York, at the same camps, took six good trout in one day last week with the fly at Stony Batter. Mr. John Woodbury, of Boston, has also had good success.

At Billy Soule's Pleasant Island camps, Cupsuptic Lake, the fishing has been good all along. The Stanley party there caught about 100 trout in three days, the largest weighing 5 lbs. Mr. Harry Dutton, of Boston, has secured the largest this season, a trout of 6½ lbs. Mr. Geo. R. Remington, of Philadelphia, has taken one of 5 lbs.

A newspaper report of Saturday says that ex-President Cleveland has again arrived at Gray Gables, Buzzard's Bay, on his yacht Oneida. He was so much pleased with his early fishing trip that he has decided to try the trout streams of that section again. These streams are leased by himself and the veteran actor, Joseph Jefferson. Saturday afternoon they captured good strings of trout from their Sagamore and Spring Hill streams. SPECIAL.

The Place where Salmon Taste Good

I KNOW a place where salmon tastes good. It is not at the restaurant on the dusty street, where hurrying men who have stopped taking advantage of each other long enough to get something to eat order salmon cut from a dull-eyed, cold-storage corpse, whose flabby gills and sodden flesh make pitiful suggestion of the beautiful thing that was. The flies trail their troublesome legs along the edge of the restaurant platter, seeking what should be theirs by right. The hum of the patent ventilator in major key is fit music to go with its bogus breeze.

I know a place where salmon tastes good. It is where clean cinders lightly drop upon the spluttering chunk of silver and pink that is fast turning to a rich brown, while the fat juice adds its aroma to the fragrance of the spread boughs overhead. The sociable jays have arrived from the depths of the pointed firs. A little bit of a brook trickles through the moss at my feet, and the water of it will make a man stop and drink when he is not dry. The little brook sings in happiness as it runs because it has done good deeds for the pitcher plants and the sun dews and the ladies' tresses along the way. The hermit thrush cleared his throat at the brook and then filled the forest with spiritual notes. Little red-spotted trout keep flip-flip-flipping out after ephemeras that swing around in the eddy where my pretty brook pours into the big sweeping river 5 ft. away. The foam-covered river whirls its current past in ceaseless dignity, and the thunder of the booming falls keeps the air a-tremble. The breeze that bloweth just when it listeth wafts fine spray into our faces betimes. A mighty salmon hurls himself out of the flood in exuberance of vigor and splashes shimmering drops of water over my canoe that is drawn up upon the sand. Another salmon will splurge out at the same place in a minute or two. There's a bear track and a caribou track in the sand by the canoe. Let's sit upon this dead birch trunk that was polished by drifting ice and splintered by a plunge through the rapids before it stranded at the right place for camp. Let's hold a tin platter on our knees and poke a lot of tender, juicy, hot salmon out of the fry-pan, shake over it a little pepper and salt, shoo away a mosquito that hovers in the air. Ah! There's the place where salmon tastes good.

ROBERT T. MOORE.

CHICAGO AND THE WEST

Chicago Fly Casting Club.

CHICAGO, Ill., June 3.—There is in progress to-day at Bass Lake, Ind., a little outing party of the Chicago Fly-Casting Club, who are this time out after bass. At this writing returns are, of course, not available, but the prospects may perhaps be determined from the following letter of invitation:

"At the contest held May 27 it was decided to have a fishing excursion to Bass Lake, Ind., Saturday, June 3. We leave Dearborn Station, Erie Railroad, 3 P. M., arriving at lake 5:16. Boats and guides will be in attendance and the evening can be devoted to fishing. We can return Sunday evening, or, by taking 5 o'clock train, arrive in Chicago Monday morning at 7. Railroad fare, round trip, \$2.25. Brother Braybrook has offered a hotel rate of \$1 per day for this occasion. He will also furnish guides for Saturday afternoon and Sunday all day at \$2. Bass Lake is two and a half miles wide by five and a half miles long, and conceded to be one of the best lakes within that distance of Chicago. To the occupants of the boat (two fishermen) catching the greatest number or pounds (to be decided by the vote of those in attendance) have been donated, and will be given, two silver flasks, also a handsome sterling match case has been donated as the booby prize. Please notify secretary by Friday noon if you will join us. Be sure to come and invite your friends.

"Fraternally yours,

"ITHA H. BELLOWES, Pres.

"GEO. A. MURRELL, Sec'y-Treas."

Western Waters.

Our Western trout season is now on in full swing, and those parties who have gone out to-day either to Wisconsin or Michigan ought to have the best of success. June is the month of mosquitoes and fish. We go out fishing a great deal in May, but the weather is so variable that a good many trips are water hauls. June is the anglers' month.

It is now permissible to catch bass in Wisconsin, and I should think that the present warm weather would set the bass moving in great shape. Indeed, numbers of good catches have been made, mostly of big-mouth bass, in the Fox Lake chain and the lakes of lower Wisconsin.

I have word that the Grand River and the Kalamazoo River of Michigan are now getting about prime for bass. Do not forget the Thornapple River of Michigan, also, which has bass and also trout, a combination which is not often found.

Mr. W. P. Nelson, of the American Wall Paper Company, Chicago, is a gentleman who has been chained to business too much and too long. Finding himself breaking down from the strain, he resorted to travel, and has spent much time abroad. Recently no less a specialist than Dr. S. Weir Mitchell told him that he was making too hard work out of traveling, and would not be benefited by it. "Go to some far-off country, where you will have to wear a flannel shirt," said Dr. Mitchell, "and just loaf and take it easy. You'll get all right then." Mr. Nelson having consulted one great specialist, concluded he would try another, so he came in to see me the other day. I have sent him to a place in Wisconsin where the foot of man never trod, and where he will probably get lost and not be heard of for six months or so. If he ever comes back I may report on his case further. What difference does it make how much wall paper you have, if you do not have your health?

'Lunge Country.

Messrs. H. L. Stanton and Frank Willard, with their wives, will leave next Friday for their annual muscullunge trip to Squirrel Lake, Wis. Col. J. S. Cooper is now, or should be, in the wilds of Minnesota pursuing his favorite sport. Mr. Oswald von Lengerke visits Kabbekona Camp country, Minnesota, within the fortnight. The muscullunge season should be at its height within the next ten days. This has been a very late season for all sorts of fish.

Wanderers.

Mr. R. B. Organ, of this city, who is connected with the freight department of the Nickel Plate road, is at large somewhere in the West, among the big wool ranches. He visits Colorado, Utah, Wyoming, Montana, Oregon and Washington, and will not be back to Chicago until about the first of July. If he has any time free from business he ought to have some sport of some sort or another in the country which he touches.

Mr. T. A. Divine, of Memphis, Tenn., paid a flying visit to this city last week, and called upon a few of his numerous friends here.

Mr. Charles Cristadoro, of St. Paul, Minn., paid the FOREST AND STREAM office a call during a hurried stay in this city June 1. Mr. Cristadoro continues his interest in the National Park proposition, to which attention has been called earlier in these columns.

The "Saginaw Crowd," including Mr. W. B. Mershon and a lot of his near angling friends, left Saginaw, Mich., yesterday for a trouting trip. It would have been a liberal education to join the party had that been possible in accordance with the kind invitation.

Dangers to Michigan Trout.

There is a dangerous measure up in the Michigan Legislature, which takes up the very old and dangerous question of the marketing of trout caught in private ponds. No thinking man needs to have it explained to him just why this is a dangerous measure. We have the same thing here in Chicago when we allow grouse from one State to be marketed while our own grouse cannot be sold. How can you tell them apart? The answer is, You can't. These are the good words which a Saginaw newspaper has to say about this pernicious trout bill:

"Senate bill 371, A. G. Smith, allowing the sale of trout caught in private ponds, which has just been passed by the Senate and has gone to the House, ought to be killed. The measure will act simply as a loophole whereby the effect of the present fish law will be completely counteracted. It will give the opportunity to hundreds of dishonest people, who await eagerly every possible opportunity to escape the action of the law, in order to fill their purses by dealing in fish protected so as to make it in

great demand. Should this bill be passed it would simply result in the "wild trout" being seined, dynamited or speared in such quantities that, within five years, there would not be a stream in Michigan where a trout could be found. Upon reliable information, the News has learned that not long ago the game warden suspected that a regular shipment of frogs to the Chicago market was not entirely right. As a result he opened one of the boxes and found it filled with trout which had been illegally killed by dynamite, spear or seine. If this bill is passed it will not only mean the complete annihilation of the trout in private ponds, but the throwing down of all barriers in trout streams by making detection and conviction of a violation of the fish law simply out of the question. All methods known would be used to secure the fish, and shipment after shipment of trout would be made to the markets; but the shippers would lay claim to having caught the fish in private ponds, and the game warden would be powerless to act. There are now enough pirates continually violating the game and fish laws who escape detection, but with such a provision as this, which they could use as a cloak to their methods, the streams of the State would be thrown open to such a rapacious onslaught, by those having only a pecuniary interest in the fish, that absolute devastation of the trout streams would result in a very short time. If there is any virtue whatever in the laws protecting fish and game, and it is admittedly a fact that the measures have provided most efficacious, this bill should be killed."

Chiefly by Hunting and Fishing.

On the lake front of Chicago, there is a long pier known as the Twelfth Street Pier, which runs out into the lake nearly a mile, which is sometimes visited by fishermen who angle for perch, but which is a little frequented sort of place, and sometimes is not entirely safe during a heavy storm. Far out at the end of this pier, with a dry goods box for a house, two ten-year-old boys, Dan Stewart and Albert Whitney, have been living for a week. They ran away from home, and have been, I presume, for the past few days, about the happiest boys in the world in this reversion to savagery. They had nothing to eat but fish, but when taken away by force from their singular camp declared that they had caught all the fish they wanted, were fond of the diet, and did not want to go home. It seems too bad to try to civilize these little heathen near at home, who are only doing what a good many of us would like to do one way or another; which is to say, to live chiefly by hunting and fishing, as the geography used to say when we were boys and read about the Indians.

E. HOUGH.

480 CANTON BUILDING, Chicago, Ill.

The First Tuna.

SANTA CATALINA ISLAND, Avalon, Cal., May 25.—*Editor Forest and Stream:* The first tuna of the season, weighing 96lbs., was caught to-day by Prof. C. F. Holder, of Pasadena (who has also caught the heaviest tuna on record). This of to-day was taken on rod and reel with 21-thread cuttyhunk line.

KELPIE.

AVALON, May 28.—The enclosed clipping is from the Los Angeles Times of May 27.

KELPIE.

Leaping tunas have towed boats twenty miles and worn strong men out, jumped over boats and performed all kinds of tricks, but it remained for one to tip over a boat to-day and involve two members of the Tuna Club, C. F. Holder, president of the club, and Mr. Townsend, of Philadelphia, and Jim Gardner, boatman, in what might have been a tragedy. Mr. Townsend and Mr. Holder went out in Gardner's boat towed by his new launch, the Minnehaha, in charge of Mr. Bassett and son, of Pasadena, and Mrs. Gardner as spectator. They went early and were trying for the prizes of the Tuna Club, which are two handsome silver-mounted rods for the first fish of the season. They found the fish at Long Point. Mr. Townsend got the first strike and lost his fish. A few seconds later a tuna went into the air and was hooked by Mr. Holder, who brought it to gaff in a little over half an hour, after a hard fight, in which the boat was towed stern first about two miles, the launch standing by or following when the fish was gaffed and hauled into the boat, and just as the anglers were raising a cheer it made a tremendous leap and tipped the boat over. Gardner hung onto the fish, that was struggling violently, and they hailed the launch, which was some way off, all being a mile or more from shore. The boat sank at once under them, the stern, on which Mr. Holder sat, going down first and completely leaving him afloat; Gardner, the struggling tuna, Mr. Townsend, oars and gaffs sliding down toward him, the boat now standing on end. It was evident the skiff would not hold them all, so Mr. Holder, to lighten it, started to swim to the launch and finally reached it, but was so weighted down by a heavy fishing suit that for some time Mr. Bassett could not haul him in. By this time Gardner had found that the sunken boat would not support even two, and to give Mr. Townsend a better chance, who did not care to undertake the swim, and who, it was afterward found, was wound up in the wire leader, started for the launch, swimming with one hand and holding onto the struggling tuna with the other, the gaff still holding. A more plucky swim was never made anywhere. Jim was bound to save the tuna if he died for it, and despite the screams of Mrs. Jim to let the fish go he swam on, the tuna carrying him completely under water three times, but every time Jim came up with the fish, and finally he caught a rope and reached the propeller. Mr. Holder and Mr. Bassett got a hold on the fish and hauled it in, and finally got Jim in. All this time Mr. Townsend was lying coolly on the bottom of the overturned boat, watching the proceedings and refusing to allow them to help him until they had landed the fish. Finally the launch was run near the boat and a rope was thrown him and he was hauled in. When Mr. Gardner was hauled in, Mr. Holder's hook was in his leg, and the rod and reel 600ft. down at the bottom of the bay, but it was saved by hauling in the line. The launch came in amid great excitement, and every boat is out tuna fishing to-day, the fish never biting so readily.

Fred Scott Gerrish successfully landed the second tuna of the season last night, after a most exciting battle. It tipped the scales at 97lbs.

Stanley Bates played a monster for an hour and forty minutes, being towed twelve miles to sea, but unfortunately losing the fish, the hook tearing out part of its jaw.

In Long Island Waters.

A Night with the Turtles.

EAST ROCKAWAY, L. I., June 5.—A party of men in rough fishing clothes got off the Long Beach train the other night and were at once recognized as the turtle catchers who make an annual visit to the ponds and creeks in this vicinity. They went to the East Rockaway House, and under the guidance of Lockwood Pearsall got boats and proceeded to set their lines for the night's work. The hooks were attached by snells or short lines to larger lines or small ropes, and the hooks were baited and placed in position. The lines were tended during the night and examined at intervals. In the morning, before the arrival of the early train for the city, the lines were hauled ashore and the night's catch placed in heavy bags provided for the purpose. The total result of the night's work was six turtles, ranging from 18 to 30lbs. in weight. It was estimated that the total catch exceeded 150lbs.

Weakfish Running.

INNER BEACH, L. I., June 5.—Fishermen have had rather hard luck. During the early spring fish have not been as plentiful as usual, owing doubtless to the cold weather. During the last few days, however, weakfish have arrived in large numbers, and are now caught by the dozens. One party took fifty-three in less than an hour. B. Moldor has built an addition to his place, and has increased the attractions of Queens Water and Inner Beach by new board walks, new rowboats and a large auxiliary yacht, sloop rigged, with steam power if required. Queens Water may now be reached by bicycle within a couple of hours' run from the city, or frequent trains are run on the Long Beach branch of the L. I. Railroad. From Wreck Lead or Queens Water Station yachts may be had to go outside the Inlet to the fishing banks, wreck of the Iberia or other famous ocean resorts, or small boats for channel and bay fishing. The latter seems to be the favorite method of fishing, probably because it is less expensive; but the large catches of fish are usually made from the yachts in the ocean.

Scarcity of Blackfish.

WRECK LEAD, L. I., June 5.—Yesterday was a great day for fishing. The air was perfectly clear, and there was just wind enough to agitate the surface of the water without kicking up sea enough to be unpleasant—just a nice full sail breeze. A large number of fishermen came down; some went outside to the fishing banks, wreck of the Iberia, etc., while others took small boats and went for weakfish in the bay. Returning parties reported a good day's fishing, although flounders in many cases made up the bulk of the catch. A peculiar feature of this year's fishing is the absence of blackfish—the tautog of New England. Even around the wreck of the Iberia, one of the most famous fishing spots on the coast for blackfish, scarcely any have been caught this year. Weakfish are very plentiful; one party caught sixty-five fish in fifty minutes. One of the bluefishing parties caught 104 fish in one forenoon.

Newfound Lake.

NEWFOUND LAKE, Bristol, N. H.—The fishing here has not held out so well as the opening of the season seemed to indicate. But few trout have been taken lately. It seems as if the trout fishing gets poorer each year. Salmon have been taken out in fair numbers; one hooked and netted by one of our local fishermen—estimated weight 12lbs.—gleefully slipped back into the lake from the hands of the astonished fisherman, on account of his using a defective net.

About four years ago a screen was placed at the outlet of this lake to prevent salmon and other fish passing down the river and thus being lost to the lake. The screen also is a direct stop to dead or maimed fish that float down the lake, as in the fall, after the trout and salmon have been artificially stripped of their spawn, they are frequently found there and taken out. This has now been stopped by the Fish Commissioners, who prohibit the taking out of dead or maimed fish, or live fish of any kind, minnows, perch, etc. The other day a man saw a maimed salmon lying lengthwise against the screen, and instead of hooking it out with single hook and line he inadvertently used a line with three hooks on it. The Commissioners heard of it, asked him about it, and he said he hooked out a disabled fish. They charged him \$10 for his rôle of public health benefactor. They then posted a notice prohibiting for three years fishing of about an acre or more near the screen. Why? That is what the men and women of that locality are asking of the Commissioners. Why try to punish a number if one man did commit the offense of using two hooks more on a disabled salmon than the law allows? As the Governor of this State in his Fast Day proclamation deplored the drifting into spiritual darkness of the inhabitants of the rural districts, the inhabitants of one rural district deeply deplore the drifting into worldly darkness of the Governor's Fish Commissioners, and hope more light be given them.

LANDLOCKED SALMON HOUSE.

Grand Lake Stream.

GRAND LAKE STREAM, Me., May 24.—Salmon fishing is not as good as usual, small fish, 3½lbs., being the largest so far. It is thought the stripping of fish for breeding is the cause. Plenty of small ones. Weather fine. No flies.

PINK EDGE.

Lake Geneva.

LAKE GENEVA, Wis.—A report comes dated June 1: The cisco flies have put in an appearance at Lake Geneva. It will be all right to tell the fishermen that the cisco fishing at Lake Geneva will be excellent for next ten days.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

A Big Canadian Park Scheme.

A MONTREAL dispatch to the New York Evening Post, under date of June 5, says: "The Limited Privilege Fish and Game Club of Roberval and the Island House" is the name of an organization that promises to dwarf all other clubs of the kind in existence in size as well as in the extent and value of the territory that will be at the disposal of its members. It is understood that among those who will be first enrolled in its membership are Gov. Roosevelt, of New York; Sir Wilfrid Laurier, Frank Ross, Quebec's millionaire; C. M. Hays, general manager of the Grand Trunk Railway; T. G. Shaughnessy, vice-president of the Canadian Pacific Railway, and others. The headquarters of the club will be the Hotel Roberval, at Lake St. John, and it will benefit by an expenditure of \$400,000, in the construction of buildings and steamboats, the purchase of canoes and camp equipment, and the securing of hunting and fishing privileges in some 30,000 square miles of territory.

Mr. H. J. Beemer, who is the principal promoter of the new organization, estimates the total cost of the project at from \$1,000,000 to \$1,200,000 before this territory is made what the club intends to make it. Two game parks of about a thousand square miles each are to be established and inclosed by heavy wire fencing, and stocked with moose, cariboo, elk, red deer, black bear, etc., as well as with other animals and birds from lands subject to the same conditions and climatic influences of the Province of Quebec. The angling privileges include almost all the waters in the Lake St. John district, in which one may hope to find an ouananiche, namely, the whole of Lake St. John and all its islands, the Grande Décharge, and the best of the Saguenay fishing, the Mistassini, and the Peribonca, and all their tributaries. The Peribonca alone may be followed for 300 miles before reaching its source. Salmon are to be introduced into all the club waters, and hatchments and breeding ponds maintained for trout and ouananiche as well. The membership fee of the club has been fixed at \$500.

New Jersey Coast Fishing.

ASBURY PARK, N. J., June 3.—Surf fishing has dwindled to a minimum during the past week. Nothing of interest is to be gained from any of the prominent points. Bass are rare, and kingfish are equally so, just why is hard to account for. Weather and water conditions are favorable, but all efforts are of but small avail. Our inland waters are, however, more productive. Plaice fishing has never been better. Particularly is this true of Shark River; the new dyke which extends out to the sea has given us an inlet with about 10ft. of water, and the river fairly teems with plaice. Weakfish too are in the waters, but as yet none have been taken on the hook. To take thirty to forty plaice to a boat in a few hours' fishing is a common experience. In the absence of better things they are very welcome, and receive most assiduous attention. They really afford good sport when taken on light tackle, using a float. The common green minnow or killy (Mr. Mather says none but Jerseymen use the latter word, and I guess he is correct) is by all odds the most killing bait.

Barnegat Bay is holding out some inducements in the way of weakfish and bluefish, but not sufficiently so to induce our local anglers to make a trial as yet. All varieties seem to be fairly abundant outside the bar in the ocean, but as that isn't within the anglers' pale, to wait seems the only alternative.

LEONARD HULIT.

Trout Streams in Michigan.

NEW YORK, June 2.—*Editor Forest and Stream:* In last week's columns of your Chicago correspondent, Mr. Hough, there was a query from a gentleman in relation to trout fishing in Michigan.

As I've just returned from a business trip through that State, and enjoyed some excellent fishing on the opening of the season on the Pere Marquette and the Au Sable rivers, perhaps I can give a few pointers that may be of use to him or those going into that State for trout fishing.

From my own experience and what I have learned from others, the Pere Marquette and Au Sable are the trout rivers of Michigan. They both are splendid streams to fish, being free from underbrush and logs, and can either be waded or fished from boat, and the trout, particularly the rainbow, run large, and there are a great many of them.

To one going into that country I would advise taking a particularly large assortment of flies, as, from my own experience, should say that from hour to hour, as the conditions of the water and light change, one cannot tell with any degree of certainty what they will rise to.

For particulars as to the Pere Marquette, write Mr. Wm. Trott, Big Rapids, Mich. As to the Au Sable, communicate with F. L. Mickelson or E. Hanson, Grayling, Mich.

Manitoba Field Club Trials.

WINNIPEG, Man., June 1.—The entry blanks are now ready for the thirteenth annual trials of this club, to be held at Morris, Manitoba, commencing Sept. 6, the stakes to be two in number, namely, Derby and All-Age.

The club enters on this, its thirteenth season, with more promising prospects of successful trials than for a number of years past, recent reports from the club's grounds being that chickens are very plentiful this spring, and with even a fair rearing season the supply of birds by September should be abundant.

Morris, Manitoba, is a thriving town, with ample hotel and livery accommodation, charges for both being very moderate, while the adjoining prairies are of the best for field trial purposes, spectators being able to drive anywhere. The town also being connected with daily train and mail service.

As judge of the trials the club has been successful in securing the services of Mr. W. W. Titus, of West Point, Miss., one of the most prominent and experienced field trial men of this continent.

Handlers desirous of training in Manitoba, can obtain good quarters in the best of game localities at very moderate charges.

Arrangements have been made in order to prevent expense, trouble or delay at any of the customs ports of entry—viz., Neche, Pembina and Gretna. All dogs that have been duly entered in any of the Manitoba Field Trials Club events are allowed to enter Manitoba, and remain for ninety days, free of all duty.

In order to benefit by this arrangement, an accurate description of each dog is absolutely necessary, giving name, breed, sex, color, event entered in, owner's name, name of person having charge, and line of railway traveling by, must be mailed to the undersigned one week previous to date of arrival at port of entry.

WILLIAM C. LEE,

Hon. Sec'y-Treas. M. F. T. C., Winnipeg, Man.

Dog Sense.

My neighbor over the way has two dogs. One full of years and discretion, the other, a puppy, full of the devil and destruction.

After my ride the other day I could not find the leather calking boot that my horse always wears in the stable, and which I had thrown on the floor upon going out. As I came from the stable another neighbor, whose piazza faces it, informed me that he had seen the puppy carrying the boot across an adjoining field.

I looked around for the culprit, but he was missing. His mate, the old pointer Pete, was there, however. Calling the pointer, I started across the field and said to the dog: "Pete, come help me find that boot." Pete was willing and hunted for it faithfully, quartering back and forth, covering the whole field thoroughly. Finally he gave it up and came and "held up" in front of me. "Pete," I said, "you are no good. Why don't you find that boot?" He looked me steadily in the eye for a few seconds, and I could see that a gleam of reason or instinct was being telegraphed from his brain to his eyes. Of a sudden he jumped up and ran rapidly away in another direction, returning after a few minutes with a man's boot in his mouth. Now, I claim that he knew what the word boot stood for, that he remembered where he had seen a boot, and reasoned that as I wanted a boot he would fetch the one he knew of. Perhaps this was instinct, handed down by some ancestor who had off been booted; but it looked to me like a case of pretty sound reasoning.

C. E. C.

Sporting Spaniels on Canvas.

PICTON, Ont.—Canadian fanciers are beginning to recognize the advisability of having an organization to properly look after the interests of the sporting breeds of spaniels. At a meet held in Toronto, the Canadian Sporting Spaniel Club organized. Mr. H. Parker Thomas, of Belleville, was elected President. Mr. Thomas is a capable judge, as well as an enthusiastic fancier, and no better choice could possibly have been made. Mr. Geo. Douglas, Vice-President, of Woodstock, needs no introduction. His success as a breeder and exhibitor is well known. Mr. R. Jeffs, Toronto, is the Secretary-Treasurer. With such men as these at the helm, if the proper support of the breeders and fanciers is accorded, we can confidently expect this club to be a success.

Points and Flushes.

We have received inquiries of late concerning breeders of bloodhounds and breeders of French poodles, but regret we have no exact knowledge concerning them in the absence of definite information, as is found in an advertisement.

Our advertising columns offer the best medium for promoting business between the owner who wishes to sell a dog and the man who is minded to become an owner.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

24. Burgess, 2d cham., Marblehead, Massachusetts Bay.
26-29. Sea. Cor., cruise to New London and return, L. I. Sound.

Decoration Day, 1899.

THE holiday that is now universally observed by American yacht clubs as the formal opening of the season was marked this year by exceptionally fine weather in many localities. About New York the day was bright and warm, with a fresh S.W. wind that made good racing. While some of the clubs, like the Harlem and the South Boston, made racing the feature of the day, in most cases the ceremonies included only the putting of the clubs in commission with a review of the fleet and a general reunion at the club house.

Atlantic Y. C.

SEA GATE—NEW YORK BAY.

The Atlantic Y. C. began the day with a gun at 10:30 from Ramona, schr., Vice-Com. Whitlock, answered by a salute from the fleet. At 11:20 a special race was started from off Craven Shoal Buoy, the 36ft. and larger classes sailing by the Swash Channel Bell Buoy, around the Old Orchard Shoal Buoy by the bell buoy off the Hook and home by the Swash buoy, 19½ miles; the smaller classes sailing the same outward course, but coming home from Old Orchard by way of the S.W. Spit Buoy, 16½ miles. The one schooner entered sailed alone over the Scotland Lightship course, 21½ miles.

After being changed from cutter to yawl, Katrina is out this year under schooner rig; she had no competitor. Acushla II. is a new yacht, for the 5ft. class, a center-board boat designed and built by C. C. Hanley late last year, and sailing her first race.

There was a fresh S.W. breeze at the start, making a reach down the Lower Bay, Acushla leading. The Old Orchard mark was turned: Acushla II., Uvira, Memory, Oiseau, Eidolon, Chispa. The times were:

Schooners—Start, 11:20.

	Finish.	Elapsed.
Katrina, Robert E. Tod.....	2 51 52	3 31 52
Cutters and Sloops—Class K, 52ft.—Start, 11:25.

Zenobia, J. C. Swan.....	3 07 40	3 42 40
Memory, E. Hope Norton.....	2 55 42	3 29 42
Sloops—Class N, 30ft.—Start, 11:30.		
Oiseau, J. R. Maxwell.....	2 35 48	3 05 48
Newasi, A. H. W. Johnson.....	2 51 32	3 26 32
Mainsail Cabin Yachts—Start, 11:30.		
Qui Vive, George Freeth.....	3 00 50	3 30 50

The winners were Katrina, Acushla II., Eidolon, Memory, Oiseau and Qui Vive.

Harlem Y. C.

CITY ISLAND—LONG ISLAND SOUND.

The first open regatta of the Y. R. A. of Long Island Sound, that of the Harlem Y. C., was a success in point of starters, and also in the matter of weather. Out of the fifty-four yachts which crossed the starting line, all but twelve finished; and in most of the classes there were from four to nine competitors. The start was made off Belden's Point, the courses being around Matinnicock and Parsonage Points, 20 miles, naut.; around Matinnicock and Delany Points, 18 miles, and around Old Hen Buoy and Delany Point Buoy, 13 miles. In addition to the regular prizes, the Williams cup was offered in the 43ft. class, open to club yachts only, and to be won three times before becoming the property of the winner. The start was made at 1 P. M., with wind enough to call for a reef in some of the smaller boats, while Nimrod lost her topmast after passing Parsonage Point. The times were:

Prize, H. H. Van Rensselaer	3 07 44	0 42 44
No Name, H. E. Doremus	3 08 58	0 43 58

South Boston Y. C.

SOUTH BOSTON—BOSTON HARBOR.

The South Boston Y. C. was specially favored in its first race from its new station, where the new club house was crowded through the day and evening by members and guests. There was a good fleet of yachts and plenty of wind to try them, a reefing sou'wester with hard spots that brought sorrow to masts and gear, but made a lively and exciting race. In the regular Y. R. A. classes there were fifteen starters, with eighteen in the different special classes, under the old rules. Ashmet and Elfreda started in a way that promised a fine race, but within a quarter of an hour the mast of the latter was over the side. In the 25ft. class the new yawl Jeanette was over the line before the gun, and in returning made some trouble for the other boats. She too lost her mast, while Eleanor lost her bowsprit and Mindora carried away a throat halyard block.

The knockabout Hazard, with no competitor, went into the 21ft. class with the schooner Bud and the new Heiress. She led from the start and beat the schooner easily. The new boat was disabled and withdrew. The times were:

30ft. Cabin Class.		Elapsed.
Ashmet, W. F. Bache	1 29 00	
Elfreda, Hall and Johnson	Did not finish.	
25ft. Cabin Class.

WOLLASTON, MASS.

A race was sailed in a variable and puffy S.W. wind, the times being:

	Elapsed.	Corrected.
Thelura, E. A. Merrill	1 37 00	1 43 01
Beatrice, W. D. Gwin	1 42 03	1 43 09
Muriel, J. L. Smith	1 44 40	1 46 16
Gwendoline, E. A. Snow	1 44 52	1 53 15
Ziska, A. L. Baker	1 37 00	Not meas.
West Wind, W. M. Chase	Did not finish.	
L. J. F. Burgess	Disabled.	
Premier, Hayden, Bros.	Disabled.	

The judges were Com. A. C. Gardner, H. E. Nelson, Geo. A. Dickey and A. T. Barstow.

Plymouth Y. C.

PLYMOUTH, MASS.

The Plymouth Y. C. opened the season with a race in a reefing breeze from S.W., the times being:

First Special Class.		
Grace, M. S. Weston, Jr.	1 49 27	
Amie, Bittenger Bros.	1 57 42	
Dolphin, N. Morgan	1 58 59	
Seaweed, P. S. Bailey	2 03 57	
Ideal, Winslow Whitman	Withdrew.	
Second Special Class.		
Veritas, Alex. Holmes	1 23 21	
Kittewake, H. M. Jones	1 24 28	
Scrap, Arthur B. Holmes	1 26 14	

Fall River Y. C.

FALL RIVER—MOUNT HOPE BAY.

The usual Decoration Day regatta was sailed by the Fall River Y. C. in a fresh S.W. wind, the times being:

First Class.		
	Elapsed.	Corrected.
Nellie, J. Oates	3 00 26	...
Adelia, F. Laboutie	3 01 13	...
Emeline, F. White	Did not finish.	
Second Class.		
Patience, J. Millward	3 05 41	3 05 41
Marguerite, M. Peck	3 08 50	3 06 50
Third Class.		
Colleen, M. Considine	1 54 21	1 54 21
Ida A., J. Harris Foster	1 58 33	1 57 31
Rival, I. N. Arnold	2 01 46	2 00 44
Inez L., W. Whittaker	Did not finish.	
Fourth Class.		
Alice W., Ed Morse	2 10 02	2 08 47
Fedora, Hinkley & Copping	2 09 16	2 08 48
Dora, J. Conboy	2 11 42	2 10 46
Laloo, J. Whitehead	2 20 46	2 20 46
Fifth Class.		
Columbia, Wood Bros.	2 04 42	2 04 43
Curio, Borden Bros.	2 07 03	2 05 40

The race committee included R. D. Briggs, T. D. W. Wood, William J. Wiley, Fred A. Gee and Fred B. Durfee.

Corinthian Y. C. of Philadelphia.

ESSINGTON—DELAWARE RIVER.

The Corinthian Y. C. of Philadelphia celebrated the day very pleasantly by a racing cruise to Claymont, eight miles distant, where time was taken for dinner, the fleet afterward racing home. The times were, morning race:

Schooners—Start 10:59.		
	Finish.	Elapsed.
Lesbia, E. W. Clark, Jr.	12 09 25	1 10 25
Vigil, A. N. Chandler	12 09 43	1 10 43
Atalanta, C. H. Brock	12 34 29	1 35 29
Sloops.		
Zealand, H. F. Smith	11 59 01	1 00 01
Surprise, J. J. DeKinder	12 00 51	1 01 57
Narounya, R. P. White	12 04 10	1 05 10
Knockabouts.		
Grilse, Mrs. M. D. Geary	12 10 04	1 06 04
Fareeda, Robert Toland	12 10 05	1 06 05
Kid, Alex. Van Rensselaer	12 10 30	1 06 30
Fly, Mrs. Edith S. Crozer	12 13 07	1 09 07
Yawls.		
Rosalind, H. F. Smith	12 08 58	1 09 58
Keven, C. Barton Keen	12 21 26	1 22 26

Afternoon Races—Start 3:39.

	Finish.	Elapsed.
Vigil	4 37 00	0 58 00
Lesbia	4 38 14	0 59 14
Atalanta	4 48 58	1 09 58
Narounya	4 37 01	0 58 01
Zealand	4 41 43	1 02 43
Surprise	4 42 04	1 03 04
Fly	4 43 09	0 59 09
Kid	4 43 12	0 59 12
Grilse	4 43 51	0 59 51
Fareeda	4 45 40	1 01 40
Rosalind	4 48 26	1 07 26
Keren	Not timed.	

Penataquit Corinthian Y. C. Spring Regatta

BAY SHORE—GREAT SOUTH BAY.

The Penataquit Corinthian Y. C. sailed a good race, the wind being fresh S.W.; the times were:

First Class—Sloops—Start 1:05.		
	Finish.	Elapsed.
Lydia	3 16 00	2 11 40
Squaw	3 32 53	2 27 53
Muriel	Disabled.	
Second Class—Cats—Start 1:15.		
Wanda	3 48 27	2 33 27
Beulah	Did not finish.	
Knockabouts—Start 1:10.		
Adaline	3 43 22	2 33 22
Ref	3 55 40	2 45 40

New Bedford Y. C.

NEW BEDFORD—BUZZARD'S BAY.

The New Bedford Y. C. held its annual review of the fleet, followed by a race, the course being 10¼ miles. The wind was fresh S.W., and the times were:

Third Class—Schooners.	
Mizpah, H. M. Plummer	1 35 25
Betty, R. A. Terry	1 40 25
Second Class—Sloops.	
Nerine, Dr. E. M. Whitney	1 24 57
Fantasy, E. B. Hammond	1 27 00
Oneida, W. F. Williams	1 33 41
Third Class—Sloops.	
Byndheld, J. C. Nowell	1 31 42
Sweep, Wm. Knowles	1 36 26
Thyra, Horace Wood	1 38 20
Madeline, C. H. Allen	1 41 11
Fourth Class—Sloops.	
Wavelet, F. B. Sistare	1 47 28
Medea, F. H. Macy	1 50 24

Williamsburgh Y. C. Annual Regatta.

NEW YORK—BOWERY BAY.

The Williamsburgh Y. C. sailed its annual regatta over a triangular course

Yacht Designing.—XXXI.

BY W. P. STEPHENS.

(Continued from page 411, May 27.)

THE term *mechanical drawing* is often understood in a double sense, as applying to a certain method of drawing by means of instruments; and also to the representation of machines, buildings and other structures. The first sense is the true one, a method of drawing an object in its true size or proportions as determined by actual measurements, and by means of various instruments. It is the reverse of *freehand drawing*, in which an object is depicted as it appears to the eye, the only instruments used being the pencil, pen or brush held freely in the fingers. From the nature of the case it follows that the former method is better adapted to purely mechanical structures and to the purposes of the designer builder.

Mechanical drawing is itself subdivided into two distinct methods of working; one termed *mechanical construction* and the other *geometrical construction*. In the former method points are located and lines are drawn by means of the scales, T-square, triangles, parallel ruler and similar instruments. In the latter, the various points are located and the lines drawn according to the principles of geometry, the only instruments necessary being the straight-edge, dividers and compasses.

In theory at least, a greater degree of accuracy can be attained by the *geometrical construction*; but it is by no means as expeditious as the *mechanical construction*. The draftsman must use his judgment continually as to the method better adapted to the special work in hand, to give sufficiently accurate results in the least possible time. With instruments of good quality and carefully preserved, all necessary accuracy for most purposes of machine and architectural drafting can be had by simple *mechanical construction*, and at a great saving of time; and even in marine drafting there is much of the work that can best be done in this way.

In drawing the actual lines, however, especially if on a large scale, it is absolutely necessary—if a design is to be faired up accurately in all of its numerous intersections, and in a reasonable time—that all the foundation lines of the drawing shall be truly spaced and parallel or perpendicular as the case may be. For this class of work it is best to use the geometrical construction unless one can be sure of absolute accuracy in the tools; for instance, in using the T square for drawing the level lines and base line of the sheer plan, a very slight error in the working edge of the drawing board, where the head of the T square is in contact, will cause these long lines to diverge or converge materially at the bow, making it very difficult to fair in the bow-buttock lines. In this work the geometrical method saves more time in the end than is lost in the beginning, though it takes longer to lay off the lines than by the T square and triangle. The following simple problems not only serve to illustrate the use of the instruments, but they occur constantly in the course of ordinary drafting work. Most of them are geometrical, but in several cases, as in Problems I. and II., they are *mechanical*.

Problem I.—To draw a straight line through given points: The two points are first located and marked by a very fine dot with a hard pencil or by a slight prick in the paper from the point of the dividers. In order to make them easily visible, a small circle is drawn, *freehand*, around each. The straight edge is then adjusted at a small distance, 1-32 in. or even less, from the two points and exactly the same from each, the pencil or pen is poised over the left-hand point, dropped to touch the paper, and drawn steadily onward to the right until it stops on the right-hand point; unless the line is to be continued beyond the point.

Problem II.—To lay off distances along a given line: Select the required scale, lay it on the paper close to the line with the zero mark of the scale coinciding with the starting point. Proceed along the scale, counting the required distances and marking each with a hard sharp pencil with conical point, held nearly square to the paper, or with a fine steel point. The scale must be held so firmly that it cannot move during the operation. If the scale is not long enough to cover the entire length of the line, lay off a portion the full length of the scale, shift the latter ahead and renew the operation until the total length is accurately laid off; then begin again and lay off the intermediate distances. All distances should be measured continuously from the starting point at one setting of the scale; instead of setting off each from the last marked. By the latter plan any errors are cumulative, and affect the truth of the whole work instead of a small portion.

Problem III.—To divide a line into two equal parts: Open the dividers to a distance a little greater than half of the given line, place one point on one end of the line, drop the other point on the line and close slightly until the point appears to be midway between the two spots. Now swing the first point over to the other end of the line, which it will probably not quite touch. Correct the dividers by just one-half the extent of the error, if they are too long by $\frac{1}{8}$ in., close them 1-16 in., and try again. After a little practice very few trials will be needed to give the exact center.

This method may be repeated to subdivide one-half the line, and thus in turn until it is subdivided into any even number of equal parts. It is but little more difficult to divide a line into three equal parts in the same manner, as is required in finding the center of a triangle, such as a jib.

Second method. Let AB, Fig. 74, be the two points, from each in turn, with the dividers set to a radius a little greater than half of the distance, describe two arcs above and below the line. The intersection of each pair of arcs, at C and D, when joined, will give a line perpendicular to AB, and dividing it in the center.

Problem IV.—To divide a line into any given number of equal parts: **First method (mechanical).** Measure the length of the line accurately with a scale, divide the distance by the required number of parts, the quotient being the length of one part. Take this measurement from the scale with the hairspring or the spring bow dividers, start at one end, and space off the parts, swinging the dividers as shown in Fig. 68. When the end of the line is

FIG. 74

FIG. 75

FIG. 76

FIG. 77

FIG. 78

FIG. 79

FIG. 80

FIG. 81

reached, the point of the dividers will probably fail to cut the exact point, overrunning or falling short a little. The reason for this is that the measurement, as taken from the scale, was not quite accurate; and the error, though very slight, has been multiplied by the total number of divisions. If it is required to divide the line into twelve parts, the original error will be multiplied twelve times, and though it may have been no more than the breadth of the black line on the scale, it will now be quite apparent at the end. The necessary correction will be very slight, in this case but 1-12 the amount of the final difference. The line will then be stepped over a second time, making the lightest possible mark in the paper, and if necessary another correction and trial made. The terms "accurate" or "exact," as used in connection with this work, imply that in dividing a waterline 2 or 3 ft. long into twelve equal parts, the point of the dividers, as sharp as a fine needle, should drop into the fine hole pricked with a needle point in the paper when the length of the waterline was first laid off. Such accurate work as this is not always necessary, but the draftsman should practice it in order to be proficient when the occasion arises, and also because the habit of doing rough and inaccurate work is a bad one to encourage.

Second method (geometrical). Let AB, Fig. 75, be the line, which it is required to divide into any given number of parts, as for instance, six. From A, at any convenient angle, as 20 to 30 degrees, draw AC, of indefinite length. Now set the dividers to a suitable distance and space off from A on AC six equal spaces, A1, 1-2, 2-3, 3-4, etc. Draw a line through B and the sixth point of division, and then draw lines parallel to B6, through each of the other points, 5, 4, etc.; where these lines intersect, AB will be the points of division.

The same method may be applied in a slightly different form, as in Fig. 76. Draw the inclined line AC and through B draw BD parallel to AC. Lay off the number of spaces from A on AC, and from B on BD; join B-6 and A-VI, also 1-V, 2-IV, etc., and the intersections of these new lines with AB will give the required points of division. This construction is strictly geometrical, with the compasses set to any convenient distance, an arc of a circle is described from A below the line and from B above it. The lines drawn from A and B tangent to these arcs are of necessity parallel.

The mechanical method, by the scale, is used when a line several feet in length is to be divided, as for instance in laying off the stations for a new design. The geometrical methods are the better for the division of short lines, as in laying off a special scale of feet and inches.

Problem V.—To draw through a given point a line parallel to a given line: Let AB, Fig. 77, be the line and C the point. Set the dividers or compasses with the point on C, and adjust the other point to touch the line AB. Set the point of the compasses on the line near B and describe an arc EF. Through C draw a line tangent to the arc EF at the point D, it will be parallel to AB.

A second method is shown in Fig. 78. Set the compasses on C and adjust to cut AB at E. Transfer the point of the compasses to E, and with the same radius describe the arc CF. Measure the distance CF with the dividers and set it off from E on the arc D; the line drawn through CD will be parallel to AB.

Problem VI.—To draw a straight line parallel to a given line and at a given distance from it: Let AB, Fig. 79, be the given line; set the dividers to the given distance, by the scale, and describe from A and B in succession the arc C, D. The line CD, tangent to the two arcs, will be the required line.

Problem VII.—To draw a line through a point perpendicular to a given straight line: **First method.** Let AB, Fig. 80, be the line and C the point. Set the compasses on C and describe the arc DE, with any convenient radius. From D and E in succession with a radius somewhat greater than half the distance between the two points, describe the arcs which intersect in F. A line drawn from C through F will be perpendicular to AB.

It may happen that there is no space below AB, in which case the intersecting arcs may be drawn above the line, at G.

Second method: Let AB, Fig. 81, be the line, and C the given point, in this case near to the end of the line. Place one leg of the dividers at a convenient point, as D, and set to cut the point C; then describe with the same radius an arc below the line. Now place the dividers on E, set to touch C, and describe another arc below the line, intersecting the first arc in F. A straight line through C and F will be the required perpendicular.

Columbia and Defender.

THE date of the launching of Columbia is officially announced as Saturday, June 10, on the night tide, about 7 P. M. The launching will be public, and the high road in front of the shops, as well as the waters of the bay in front, will be free to all spectators. The work of finishing is being hurried in all departments. The bottom is being polished by buffing wheels, followed by the crew with cloths and pumice stone. The topsides are as yet unpainted. The deck joinerwork is being finished, to go in place as soon as the last deck planks are laid. On June 3 the large sheer legs at the works, after being used to lower the 30-footer Musmé into the water, were guyed back too far and fell over, fortunately doing little damage. Defender left Bristol on Saturday and anchored in Brenton's Cove, Newport, the same evening. Columbia and Defender will sail a preliminary race outside Sandy Hook on July 1, but it is very unlikely that either will race in Long Island Sound at any time.

The Queen City Y. C. sailed a cruising race from Toronto to Port Credit on May 27 in a strong and squally westerly wind. Only four yachts finished out of eleven starters, two having capsized and one losing her mast. The times were, start 2:30:

	Finished.	Elapsed.
Petrel	5 15 00	2 45 00
Faneta	6 03 00	3 33 00
Widgeon	6 15 00	3 45 00
Turtle	6 57 00	4 27 00

Petrel, W. R. McGill, is a new yacht.

Columbia's Crew.

THE Rockland correspondent of the Boston Globe gives the following particulars of Columbia's crew:

Twenty-nine members of the Columbia's crew arrived here from Deer Isle this afternoon (May 30) and left on the 1:30 train for Bristol, R. I. The party was made up as follows: Willard Haskell, Samuel Bray, F. McCauley, John T. Marshal, Charles Barter, John E. Billing, Geo. Stinson, F. C. Haskell, Charles Bray, Augustus Thompson, Nelson Thompson, Theodore Thompson, Edw. Carmin, Alvah Conary, Jason Gross, Alfred Pettee, John E. Gross, Everett Thompson, Philip Haskell, William Ellis, William Eaton, Charles Gray, Herbert Bray, Warren Bray, Daniel Hall, Arthur Young, William Young and J. F. Eaton. Quartermaster Haskell will have charge of the detail until its arrival in Bristol. The crew will at once go aboard the tender.

The St. Michael was taken to Bristol by members of Columbia's crew, who preceded the main body.

Capt. F. P. Weed, who has a second time been entrusted with the important duty of selecting a cup defender crew, came as far as Rockland and expressed the highest opinion of the men selected to sail Columbia. There are six more men in this crew than there were in Defender's, but in place of a few hours in which to select his crew, he has had ever since last September, and it is the flower of Deer Isle's famous yachtsmen who left for Bristol this afternoon. Every man is a resident of Deer Isle, Stonington, or some of the numerous villages which go to make up the island's population.

Another fact on which Capt. Weed lays great stress is that every man is American-born and bred. All told, there are thirty-nine of them, including thirty-four sailors, four quartermasters and a second mate. Fourteen men who were members of the Defender crew will sail on the Columbia. They are: William Scott, Ross Piffeld, Charles Scott, Rollins Staples, Willard Haskell, Samuel Bray, F. McCauley, John T. Marshal, Charles Barbour, John Billings, George Stinson, Ernest Haskell, Warren Bray and Herbert Bray.

Columbia's crew has been on pay since April 15. The men have all had experience as yachtsmen, but during the winter most of them have been at sea. Quartermaster Haskell has been mate of the schooner Hugh Kelley, 1,400 tons, in the West Indies trade.

The sailors are to receive \$45 a month and \$4 for each race in which Columbia participates, trial races and all. The quartermasters receive \$60 a month, with race money. The crew of Defender netted \$56.50 apiece and the quartermasters rising \$70, but Capt. Weed figures that their receipts will be even larger on Columbia.

The men arrived here in citizens' clothes and were as brown as exposure to the hot sun could make them, but they are stalwart, lithe and well-formed, and attracted much attention on the streets. There were a large number at the train to witness their departure.

Capt. Weed probably is the only man in Maine and one of the favored few in existence who have seen the plans of the new cup defender. He says that the new craft is an improvement in every way over Defender, and will beat her in the trial races as badly as Defender beat Vigilant.

"Up to the time Defender was built," said Capt. Weed, "everything was an experiment. Defender showed herself to be nearly perfect, and taking advantage of her defects, Mr. Herreshoff has constructed in Columbia a yacht which is an improvement from keel to truck over Defender. This improvement will be shown in every department of her construction, sails, rigging and spars alike.

"Shamrock I judge to be equally an improvement over Valkyrie, but we will give them a big surprise party just the same. Of course, we've all got to admit that Mr. Herreshoff knows more about yacht building, whether steam or sail, than any man living, and what Mr. Iselin doesn't know about racing and managing a race isn't worth knowing.

"Capt. Barr, First Mate Allen and Second Mate Scott are past masters in the art of racing, while we have given them a crew which completes all to be desired. It will be the grandest race ever seen on the water, and the American yacht, with her all-American crew, will win."

Capt. Weed has an urgent invitation to be aboard Columbia during the trial races, but probably will content himself with attending the international races.

The Yankee—Dominion Match.

THE first of the many important international and inter-club matches of 1899 will be started on Monday, June 12, on Lake St. Louis, the scene of so many interesting matches of late years. The following particulars of the challenging party are from the St. Paul Dispatch:

"All aboard for Montreal—and victory."

Montreal certainly—victory, perhaps.

The Yankee, champion of the White Bear Y. C., was shipped Monday night (on May 29) over the Soo line on a special car, and will arrive in Montreal in about a week. The packing of a boat for so long a journey is an important work, and Yankee was braced and fended in every possible way, so that she might make the trip in safety.

Eugene Ramaley, of White Bear, will leave for Montreal Sunday to be on hand to superintend the launching of Yankee in Canadian water and see to her being rigged and put in shape.

Capt. Ordway and his party will take their departure in the special Soo line car Tuesday evening and arrive at their destination Thursday morning.

The captain and his men will make their home in the car, and at the club house of the Royal St. Lawrence Y. C., the Montreal men having invited the Yankee crew to be their guests during the week of the races.

The men who are going in the special car are Capt. Ordway, ex-Com. H. T. Drake, in charge of the car; W. S. Morton, sec'y of the club; F. M. Douglass, Oscar T. Taylor, W. J. Murray, C. M. Griggs, T. L. Wann and P. C. Stohr.

This makes a party of nine, one for each berth in the car, which has its complement already.

Capt. Ordway may, under the regulations, have a crew

of four men, and, as at present arranged, this crew will consist of the following men:

F. M. Douglass on the jib; Eugene Ramalay on the main sheet; H. T. Drake at centerboard and stays; Capt. Ordway at the helm.

C. M. Griggs is the alternate skipper, and will come forward in case the fortunes of war demand.

Capt. Ordway and his crew will have from Thursday morning to Monday to study the course on Lake St. Louis, and do some preliminary practice sailing.

The White Bear Y. C. committee on the race is composed of Messrs. Drake, Ordway and MacLaren.

Marcus D. Munn, part owner of Yankee, is planning another expedition which may leave for Montreal on Saturday evening, June 10, going over the Soo road. It is understood that this second party is not made up entirely, but those who are booked for it are Mr. and Mrs. Munn, Mrs. C. M. Griggs, Mrs. Wann and Mr. and Mrs. M. F. Patterson.

Still a third expedition is proposed, to stop at Toronto first, and then proceed to Montreal by boat. Those who are already down for this trip are Com. and Mrs. Skinner, Mr. and Mrs. A. B. Driscoll, Mrs. H. T. Drake, Mrs. P. C. Stohr and Mr. and Mrs. Cass Gilbert.

Yankee will fly the new White Bear Y. C. flag, blue field with a red circle in the center, within which circle is a white bear.

The crew of Yankee will also be dressed in the new club uniform, a white cap with the club flag on the front, gold braid and gold buttons; white sweaters, white trousers, white shoes.

The Canada Cup.

THE 35-footer designed and built by Wm. Burnside, of Hamilton, was launched on May 22, being christened Myrtle. Her dimensions are said to be 44ft. 4in. over all, 25ft. l.w.l., 10ft. 10in. beam. The hull is of the ordinary centerboard type, with long overhangs, and carries the usual long and high cabin house. The fin is of oak, about 6in. thick, with a lead bulb of 4,250lbs. The extreme draft is about 6ft. 6in. The yacht is owned by a syndicate of which Com. Walker is the head.

THE Rochester 35-footer, Genesee, did not reach Charlotte until June 1, having been driven out of her course from Oswego by a violent storm of cyclonic nature. She had a very tedious trip up the Hudson and through the Erie and Oswego canals, but reached Oswego safely and sailed west Monday night with the expectation of joining the club fleet at Sodus next morning. The storm came from the westward, striking Buffalo, Tonawanda, Rochester and other places, destroying buildings and doing much damage. The yacht, with a small naphtha launch in tow, was compelled to run, and when off Point Peter, on the Canadian shore, the launch filled and broke away. The yacht made Kingston, Canada, on Tuesday morning, having come through the storm safely; but no trace of the launch was found. The party made a new start for Charlotte, and arrived on Thursday morning. Sec'y J. E. Burroughs, of the Y. R. A. of the Great Lakes, will sail Genesee in the races.

The "Peare Syndicate" yacht, designed and built by A. G. Cuthbert, was launched at South Chicago on May 30, being christened Veva by Miss Margaret Otis. The yacht has been built under lock and key, and great secrecy has been observed concerning her. She is described now as a freak, with excessively short waterline and large sail area. A great deal of nonsense has been published about this boat as being almost a duplicate of Defender.

The new Duggan 35-footer was launched at Hodgson's yard, Toronto, on June 1, and will soon be ready for trial. Mr. J. Wilton Morse, who will sail her, has been confined to the house for the past two weeks, a serious drawback just at this time.

Knickerbocker Y. C. Annual Regatta.

COLLEGE POINT—LONG ISLAND SOUND.

Saturday, June 3.

THE Knickerbocker Y. C. made every preparation for a good race on June 3, the date of its annual regatta; but the weather proved contrary, and after a long tedious drift the race finished without conclusive results. The day was fair and bright, with a hot sun, and but a breath of air from N.E., which failed after a time. The first class was started at 12:10, the course being from off the club house around the Gangway Buoy, 14½ miles, naut., but it was nearly 3 o'clock before the leaders had covered the seven miles to the outer mark, a light southerly air helping them on after lying becalmed. The times at the Gangway Buoy were:

Anoatok	2 50 45	Hussar	3 16 05
Carolina	2 51 30	Win or Lose	3 22 04
Hera	2 51 40	Whiteaway	3 24 00
Esperanza	2 51 45	Narika	3 24 55
Alyce	3 05 25	Spindrift	3 25 40
Dot	3 10 43	Ouananiche	3 26 05
Liris	3 12 20	Nautilus	3 26 10
Moccasin	3 14 10		

The light breeze was S.W. now, making a beat home; soon it fell, and the fleet drifted until sunset, when it came in from the south'ard, and with sufficient force to take all home. The times were:

Cutters and Sloops—65ft. Class—Start, 12:10.			
	Length.	Finish.	Elapsed.
Whiteaway, F. H. Boyton	60.19	2 53 48	7 48 48
Cutters and Sloops—52ft. Class—Start, 12:10.			
Moccasin, S. H. Mason, Jr.		7 43 06	7 33 06
Liris, T. J. McCahill		7 50 24	7 40 24
Cutters and Sloops—43ft. Class—Start, 12:15.

Lobster, T. J. S. Flint	14.98	Did not finish.	
Kazaza, T. J. McCahill	14.00	5 46 49	5 06 49

The winners were Whiteaway, Moccasin, White Wing, Anoatok, Narita, Carolina, Dot, Win or Lose, Spindrift, Constance and Kazaza.

The race committee included Messrs. O. H. Chelborg, H. Stephenson, C. W. Schlesinger, Rodman Sands, F. E. Barnes and J. O. Sinkinson. The steamer Favorite carried the members and guests over the course.

Largest Sailing Yacht Afloat.

Description of the New Schooner Gleniffer.

DETAILS which we have already been able to publish regarding the schooner Gleniffer, which is being built by Messrs. Henderson at Meadowside for Mr. James Coats, have indicated that she is a vessel worthy of more than passing notice; the fuller particulars which we give below prove that she is in many respects one of the most notable vessels ever built in connection with the sport. She is without exception the largest and finest sailing yacht yet built, and curiously enough she secured this distinction more by accident than design. Her owner, Mr. James Coats, did not plan her with any idea of possessing a record-breaking vessel. Mr. Coats has long been one of the staunchest supporters of yachting in the Kingdom, and he has very generous ideas of the amount of accommodation which may be expected on board ship. Even his grand old cutter Marjorie seemed to him to be somewhat cramped in this respect, and in giving to Mr. George L. Watson the commission to design for him a new sailing yacht he specified only the accommodation which he required below. This was drafted on such a generous scale that Mr. Watson found that to get it inside a modern shapely hull the outside dimensions would require to be on a scale which has never before been touched in the building of a sailing yacht. Mr. Coats gave him, however, absolutely a free hand in the matter, and when the draft plans of the new schooner were submitted he approved of them at once and ordered the building of the boat. Such was the origin of the Gleniffer, which is now rapidly nearing completion in Messrs. Henderson's yard, and which in these days of steam cruising is likely to remain for a long time an unique product of yachting architecture. Work upon her was started early last winter, and she is now so far forward that a good idea of her imposing proportions can be obtained. Figures alone give but a slight idea of her size, but for the information of the curious it may be stated that she measures 188ft. from figurehead to taffrail, 26ft. 6in. beam, and draws over 17ft. of water, while her measurement, by the Thames rule, works out at about 450 tons. Compared with the German Emperor's cutter Meteor, therefore, she is some 60ft. longer, carries nearly 2ft. more beam, and is about the same depth. In displacement, however, her great bulk is even more striking, for while the Meteor, like other racing boats of recent years, was excessively undercut and hollowed in the garboards to something like a fin formation, the Gleniffer is long-keeled and comparatively deep-bodied—the very beau ideal of a cruising boat. Owing to her great size it was determined to build her throughout of steel, and this has accordingly been done, the timbering being of special steel angles and the plates of mild steel of the same composition as is used in the construction of torpedo boats. In general outline and in section the yacht bears a striking resemblance to the Thistle, which was sent across the Atlantic in 1887 to race for the America's Cup. The profile forward is almost identical, for in designing her Mr. Watson has abandoned the modern spoon bow and gone back to the more graceful clipper or swan neck bow of ten or a dozen years ago. Above water the stem shows decidedly hollow, but about the waterline it sweeps into a convex curve, which is carried without hollowing again down to the lower keel plates. From the end of this curve the keel runs with little or no increase of depth back to the heel of the sternpost. The sternpost is less raked than we have been accustomed to see in recent productions, and it cuts at top through a fairly long and very graceful counter, which rises with a good deal of spring, and gives an overhang of about 50ft., while the overhang forward measures about 40. The ballast to steady her against the enormous sail spread, which she will set, is carried inside—150 tons of lead, most of which is cast in one solid ingot, supported by the timbering and the inch-thick keel plates. Compared to the shallow hulls of recent racing yachts, she looks to have somewhat high topsides, and this is accounted for by the fact that instead of the apology for a rail, which is now so often seen, the deck is set round, with a serviceable protection in the shape of a gunwale 2ft. 6in. high. The deck has been kept as clear of obstructions as possible, and being broken only by a small smoking lounge at the companion and galley, which is situated amidships, it offers a fine clear space for promenading and for working the vessel.

In the construction of the yacht nothing whatever has been sacrificed for lightness or speed. While the materials throughout are the best which could possibly be procured the scantlings are all in excess of what is demanded for the highest class at Lloyd's, and every detail has been finished with the utmost care. Under water the plates are overlapped and riveted in the usual way with a double row of rivets, but in the topsides the plates are butted and strapped on the inside, leaving a beautifully smooth surface for the painters. The elaborate scale upon which the fittings below are carried out gives the best possible proof that the yacht has been designed primarily for convenience and comfort in cruising, and one advantage of the sailing type is shown by the fact that the Gleniffer has more spacious cabins and better accommodation than many steam yachts of two or three times her size. A passage some 3ft. 6in. wide leads from the companion to the main saloon, a large and airy apartment which extends the whole breadth of the yacht amidships, and so planned that it may be divided by curtains into drawing and dining cabins or used as one big saloon. The fittings of this cabin are not yet finished, but sufficient has been done to show that they will be in keeping with the other appointments of the yacht. Aft of this, on the starboard side, are the owner's private apartments, consisting of library and sitting room, sleeping cabin and bath room, all of these being airy, well-lit cabins of about 10ft. square, and with 7ft. of head room throughout. Opposite these, on the port side, are the guests' cabins, planned in somewhat similar style, and consisting of four cabins, with bath rooms, cloak rooms and smoke room adjoining. Aft of this again are two ladies' cabins, handsomely fitted and provided with everything necessary for the comfort of the lady guests. Forward of the main saloon are the officers' quarters—a snug little cabin for the skipper, and three others, which will accommodate the half-dozen officers who will assist in the command. Alongside these are the steward's pantry and store rooms, which communicate by means of a small hoist with the galley on deck.

Thirty-four men will be required for the handling of the boat, and these find accommodation in a large and airy forecabin, fitted with a special cooking range and all appliances necessary for their health and comfort. From this floor a couple of stairs lead to a lower deck running the whole length of the vessel, with a head room of about 5ft. Sails and all the lighter stores of the ship will be carried here, and below this again is another space about equally commodious, in which the water and oil tanks, cables and heavier stores will be carried. As might be expected, the sail plan and spars present many points of interest, but the masts are not stepped, and none of the gear is as yet in position.—The Yachting World.

Niagara, Howard Gould, arrived at Queenstown, Ireland, on May 30. It is stated that Mr. Gould will probably buy the Lakes of Killarney, after which he will proceed to Norway in his yacht.

The yacht designed by G. L. Watson for A. J. Drexel, now building at Scott & Co.'s yard, Greenock, will be 272ft. over all, 36ft. 6in. beam and will cost at least \$500,000. She is to be completed in a year.

The programme of the Lewiston Gun Club's shoot, fixed to take place on June 14 and 15, can be obtained of the club secretary, Mr. H. H. McComber, Lewiston, Ill. The first shoot is amateur in its purpose. A magatrap will be used to throw the targets. There are 20 events for each day, at 10, 15, and 20 targets, \$1, \$1.50 and \$2 respectively. On the second day there will be a contest at 25 targets for the county championship. Entrance, \$2.50. Open to Fulton county shooters only. Winner of medal is subject to challenge at any time after 30 days. Shooting begins at 9 o'clock. Shells shipped to H. H. McComber will be delivered on the grounds free of charge.

Capt. E. B. Puck, of Boston, writes us that he regrets exceedingly his inability to attend the Buffalo shoot, June 5-9, on account of a severe attack of la grippe. He continues: "I had made every arrangement to be with the boys and take a hand in the great amount of prizes offered by the Audubon Gun Club. Go in, boys, and do your best, and may success attend your efforts!"

Messrs. J. H. Outwater and Hofflich have arranged to shoot a match and we are informed that the conditions are 50 live birds, \$100 a side, the contest to take place on Outwater's grounds, Paterson Plank Road, N. J., commencing at 2 o'clock. Sweep-stake shooting will take place before and after the match. About 400 birds will be provided for that purpose.

In the contest for the Streuber trophy, at Erie last week, Crosby, Heikes and Cooper tied on 25. In the shoot-off at 5 birds, all killed straight to the 11th, when Crosby missed. Heikes missed his 20th, and Cooper won on a total of 45 kills in the main event and the tie.

The donors of the St. Louis Republican Wing-shot cup are contemplating a change of title to it. It was recently presented to the Missouri Association and won by Mr. Charles Young. The title of it conflicts with one already in competition.

At the meeting of the Pennsylvania State Sportsmen's Association, held on May 31, Chambersburg was fixed upon as the place for the meeting of 1900.

The live bird contest inaugurated for the cup by the Cincinnati Gun Club is fixed to take place on Wednesday of this week.

BERNARD WATERS.

The Tyrone Tournament.

ALTOONA, Pa.—Tyrone, known as the Central City, on the main line of the Pennsylvania Railroad, fifteen miles east of Altoona and at the junction of the Tyrone division of the P. R. R., is one of the prettiest among the many pretty spots in the Keystone State. It is situated on either side of the Juniata River, surrounded on all sides by jutting mountains, has wide, shady avenues and is enlivened by a number of busy factories.

District Attorney William Hicks, P. J. Trego, D. D. Stine, L. B. Blair and a number of other scatter-gun enthusiasts recently organized the Tyrone Gun Club, now one of the liveliest little organizations in Central Pennsylvania, and fixed the dates of May 26 and 27 for their initial tournament. They had fitted up a beautiful grassy plot just west of the city on the north bank of the river. A magatrap had been placed, their large outing tent pitched, and every other desired convenience was in readiness for the enthusiasts.

It was a bright sunny day that greeted the jolly crowd of sportsmen on the morning of the first day, and that condition lasted till the close of the meeting. One of the first to greet you from a distance was Neaf Appgar, of Gun Bore Treatment Co. and the Du Pont Powder Company; then came F. P. O'Leary, of Buffalo, N. Y.; Howard Sergeant, of Lafin & Rand Powder Co.; Chas. Wagner, of Hammondsport, N. Y.; Tom Keller, of Peters Cartridge Co., Cincinnati; and Charles North, of the Cleveland Target Co. Among those from nearby places could be seen W. B. Sands, Dr. F. M. Christy, U. S. Houck, Ed Kottmann, J. F. Killitts, H. F. Forney, E. H. Murray, Charles E. Rhoades, G. T. Bell, John Schenk, and G. G. Zeth, Altoona; J. B. Highberger, C. Wendroth, A. B. Earhart, S. R. Kellerman, E. D. Melley and G. A. Freeman, Cresson; L. R. Leister, Chas. Kline, B. M. Kline, H. W. Corbin and Geo. Coolidge, Huntingdon; Warren Smith, Osterberg; J. A. Holderbaum, Cessna; R. S. Denniker, Ruffsdales; H. E. Hummelbaugh, L. A. Gearhart and F. Plympton, Clearfield; and J. R. Rhoades and Frank Nisley, Johnstown.

The shoot was quite successful, and the Tyrone boys are to be congratulated. Charles North acted in the capacity of squad hustler, and kept everyone moving. The equitable system was used in dividing purses, and gave splendid satisfaction.

The Altoona Shoot.

On Decoration Day the Altoona Rod and Gun Club held a target shoot, in which twenty-three contestants participated. It was not an advertised affair, on account of the State shoot falling on the same date, but a number of the boys from Tyrone and Hollidaysburg participated, among whom were D. D. Stine, P. J. Trego and Mr. Brindle, of the former place, and Thos. Dipner, Alex. McNaught and Duncan, of the latter. Mr. William F. Parker, of Duncansville, also renewed old acquaintances and incidentally tried the new magatrap.

IN NEW JERSEY.

Freehold Gun Club.

Freehold, N. J., May 27.—Our last club shoot at targets was on May 28, and was lightly attended, owing to a "busy season" with most of our members. The high wind made high scores out of the question. In making up our record for winners at the end of the year, a shooter gets credit for every winning score, regardless of the shoot-off. Our next shoot will be at live birds.

Boiling Springs Gun Club

Rutherford, N. J., May 30.—The Decoration Day shoot of the Boiling Springs Gun Club brought together a good company of shooters. There was a stiff wind, which made the targets difficult, though the latter were not thrown so hard as is usual at this club's shoots.

Some prizes left over and shot for were a set of table knives, won by Hexamer; a silver-mounted whisk brush, Dr. Adams; a gold-decorated vase, won by Stador, Jr. There were twenty-one prizes in all.

In the main event there was a list of sterling good merchandise prizes in the prize shoot. First prize was a silk umbrella, won by Hexamer on a score of 45; second prize was a set of tea spoons, won by James; third, silver and glass tankard, Dr. Adams. The other winners in regular order were Vanderveer, Pierso, Platt Adams, Huck, Everett, A. R. Strader, Taylor, Lane, Paul, Frank, Coe Strader, Jr., and Lawrenson. Ties slipped a coin for choice.

Coe, 12	001000001010100000100010-6

East Side Gun Club.

Newark, N. J., May 30.—The holiday live-bird shoot of the East Side Gun Club was a most pleasant affair, though the shooters present were not large as to number. The birds were good. A stiff wind blew almost straightaway, which helped the flight of the birds materially. No. 1 was at 7 birds, 28yds. rise, 87; Nos. 2, 3 and 4 were at 7 birds, 28yds., 84:

Miss-and-outs:

Jeannette Gun Club.

New York, June 2.—Several matches, arranged between members of the Jeannette Gun Club, were shot yesterday, at J. H. Outwater's Riverside Park, Paterson Plank road, N. J. The birds were a good lot, but there was no wind of any account to help them. Mr. H. P. Fessenden acted as referee.

JOHNNIE JONES.

Rahway Gun Club.

Rahway, N. J., May 30.—The team race was at 25 targets, known angles. The old club has been reorganized, and this was the first shoot under the new conditions. The club grounds on the line of trolley to Boynton Beach, about a mile out, have a back-ground which is all that could be desired. The regular team shoot is fixed for each Saturday. The scores:

Sheffield Gun Club.

LORAIN, O., May 30.—The Sheffield Gun Club held a very successful shoot at their new trap grounds, at South Lorain, on Decoration Day, over 150 sportsmen being present. Shooting commenced at 2 P. M. and was continued till 7:15.

The weather conditions were perfect, and a very good afternoon's sport was enjoyed. By the wish of the participants the trap was run at a comparatively high speed and somewhat irregularly, causing a very difficult lot for birds to be thrown.

The tie between G. Freeland C. W. Hart in No. 4 for first place was shot off by agreement at 10 birds, Hart scoring 9, and Freeland 8.

Sheriff Warden took second money and W. Freeland third. The handicaps in No. 5 were by agreement taken from the previous scores, and W. Freeland took first money, Dr. Trombley and Kemery tied for second, and Felix third. The tie was shot off at 10 birds, and resulted in a second tie, with 6 birds each. A second 10 gave Kemery 4 and Dr. Twombly 2. Total 20 birds: Memory 10, Twombly 8.

Cooper won.	

Montana State Sportsman's Association.

The sixth annual tournament of the State Association commenced on May 19. It was held at Butte, under the auspices of the Butte Rod and Gun Club. The officers of the Butte Club, with their customary energy and a foresight born of experience, had prepared a thoroughly enjoyable shoot. The inclement weather interfered somewhat with the attendance, as well as with the scores. However, Montana has a set of shooters who can pile up straight scores under any kind of conditions. Incidentally, some new State records were established in the team contests.

First Day, May 19.

Event No. 4 was for the three-men team championship cup, at 25 bluebirds per man. In this shoot a new State record was made by the Anaconda team by the good score of 70 out of 75 shot at:

Twohy 25, Tuttle 23, Rockefeller 22; total, 70.	
Trudgeon 24, Jones 22, Nicols 22; total, 68.	
Smith 25, Cowan 21, Shultz 20; total, 66.	
Christianson 22, Jeager 21, McGowan 21; total, 64.	
Spargo 22, De Haas 21, Walker 20; total, 63.	
Mahan 22, Lewis 18, Dennison 13; total, 53.	
Nell 21, Bartlett 13, Brownlee 13; total, 51.	
Event No. 6, two-men team shoot, at 20 bluebirds per man:	
Rueger 20, Twohy 16	
Walker 19-39, Tuttle 16-32	
Shultz 20, Jeager 17	
Smith 18-38, McGowan 15-32	
De Haas 20, Jones 16	
Spargo 15-34, Hillis 14-30	
Brownlee 17, Trudgeon 15	
Nell 16-33, Nichols 14-29	
Cowan 17, Bartlett 15	
Christianson 16-33, Rockefeller 11-26	

Event 7 was for the bluebird championship of the State, at 25 bluebirds per man. The cup, emblematic of this event, was won by Mr. McGowan with the score of 46:

Events:	1	2	3	5	7	8	9	20

Schultz	19	19	16	17	33	17	19	
Christianson	19	21	19	16	31	19	14	
Jeager	19	25	18	19	30	18	18	
McGowan	19	21	18	20	27	17	16	
Rueger	17	17	15	19	15	15		
Jones	17	22	18	18	17	16		
Nell	17	20	18	14	25	17		
Rockefeller	16	20	17	17	26	13	14	

The general averages for the bluebird shooting in events 2, 3, 5, 8, 9, 10, 12, 13, 15 and 16 were:

Shot at. Broke.		Shot at. Broke.	
C H Smith.....200	181	Tuttle.....200	164
P J McGowan.....200	180	Twohy.....200	162
Christenson.....200	175	Cowan.....200	159
Hillis.....200	172	Nichols.....200	157
Jeager.....200	172	Trudgeon.....200	157
Rockefeller.....200	166	Walker.....200	155
Jones.....200	166	Bartlett.....200	144
Shultz.....200	166	Spargo.....200	125
Nell.....200	162		

Third Day, May 21.

Event 18, at 5 live birds: Twohy 5, Spargo 5, Tuttle 4, Rockefeller 4, Christenson 4, Cowan 4, Hillis 4, Smith 4, Walker 4, Jas. Trudgeon 4, Wm. Trudgeon 3.

Event 19, at 15 live birds: This, the most important event of the tournament in the eyes of the Montana shooters, was for the live-bird championship medal. After an exciting contest, Messrs. Jeager and James Trudgeon landed in the lead with a straight score each. The tie was shot off at 9 birds each, which each of the contestants neatly killed. At this point we ran out of pigeons, and by agreement of the interested parties, a coin was tossed up to decide the winner. The fickle goddess of fortune favored Mr. Jeager. The scores in detail were as follows:

Jeager.....212112111111-15	W Trudgeon.....11110011112212-13
J Trudgeon.....11221212122121-15	Bachelor.....01112121202211-13
Rockefeller.....212212221221202-14	McGowan.....122220102101201-11
Hillis.....222222212222022-14	Christenson.....212202002111201-11
Bartlett.....12102221222122-14	Spargo.....001201222202212-11
Knight.....221212222011222-14	Smith.....002112001112221-11
Tuttle.....10122110121122-13	Brownlee.....222000202121020-9
Walker.....0222101221222-13	Jones.....110012010201010-8

The bluebirds were thrown from five expert traps, 5yds. apart, in a straight line, unknown angles.

Woonsocket Gun Club.

WOONSOCKET, R. I., May 27.—The following scores were made at the grounds of the Woonsocket Gun Club, May 27. H. Eugene Getchell broke the amateur record for 50 birds by scoring 48, 96 per cent.

Event No. 5 was a team race, which was very close, and was not decided until the last man shot his 5.

Events:	1	2	3	4	5	6	
Targets:	10	15	25	5p	25	25	
H E Getchell.....9	10	21	6	24	A Seagrave.....6	17	7
F H Mills.....7	13	21	7	16	L W Ballou.....5	12	4
L W Campbell.....9	12	21	6	19	Chas E Ballou.....5	11	3
E B Arnold.....7	10	12	15	11	J Ellis.....3	11	3
L R Darling.....6	11	18	7	18	C Richardson.....4	11	3

The score of the team race, the fifth event, in full was as follows:

Getchell's Team.	
Getchell.....11010111111111111111-24	
Mills.....110011011111110100011101-16	
Seagrave.....0110110001111111010111-19	
Balcom.....001010000111001011011111-14-73	

Campbell's Team.

Ballou.....0111010101011111011001101-17	
Arnold.....000101110011000001111111-15-69	

ARNOLD SEAGRAVE, Sec'y.

Cincinnati Gun Club.

CINCINNATI, O., May 27.—Our shoot to-day was well attended, as the scores below will show.

There are two shoots each month. The first is on the first Thursday after the first Friday; the second is on the fourth Saturday. The "second chance" is explained as follows: Shooters who score 50 straight, or the highest score in the first shoot, and who tie in the highest score in the second shoot, have chances in the shoot-off; that is, if they are shot out in the first shoot-off, they have a second chance. A set of the Fulford automatic traps has been installed. The single lever opens, closes, changes traps and flushes the birds. It seems to work perfectly.

Mrs. Lindsley has returned from her Eastern visit, looking the picture of good health.

The club grounds in a few days will be inclosed completely with a fine 8ft. board fence, which already is well advanced toward completion.

Fort Smith Gun Club.

FORT SMITH, Ark., May 27.—The regular weekly shoot of the Fort Smith Gun Club took place at the Fair grounds, Saturday afternoon. It is a little early in the season for a good attendance, as everyone is pretty busy. Later in the summer the attendance will no doubt be much better.

Messrs. Knott and Parker, from Jenny Lind, were inattendance, the former taking part in the shooting, and the latter seeming quite interested in looking on.

Miss Agnes Oglesby favored the club with her presence, and fired a few shots to get her hand in. She expects to shoot regularly with the club hereafter. Her position at the trap is excellent, resembling very much that of Mrs. Shattuck, of Minneapolis, the famous woman champion, who made such phenomenal scores at the recent St. Louis tournament.

A 25-live-bird race is talked of for next Saturday, in addition to which the regular target events will be run off. There will be shooting each Saturday afternoon at the Fair Grounds, weather permitting, for the balance of the season. Following are the scores:

Shot			Shot				
	at.	Broke.		at.	Broke.		
Leach	50	44	.880	Baptiste	50	30	.600
Matthews	50	31	.620	Bemis	50	16	.320
Knott	50	30	.600				SECRETARY.

Kingsbridge Gun Club.

KINGSBRIDGE, N. Y., May 30.—The Decoration Day shoot of the Kingsbridge Gun Club, at live birds, was favored with clear, but windy, weather. The scores were:

T Brandt	12112-5	00122-3-8
C Goodwin	10001-2	02121-4-6
O Brandt	20120-3	02020-2-5
M Freightman	12202-3	21022-4-7
R Godwin	12222-5	12112-5-10
MacLaughlin	02022-3	02121-0-6
C Freese	10220-3	02122-4-7

COLUMBIA AND DEFENDER.

THE successful launch of the new Columbia nearly four months before the date of the Cup races marks another step in what promises to be the most systematic and scientific defense of the trophy that has ever been made. In designing Defender, Mr. Herreshoff made wide departures from his previous yachts, Navahoe, Colonia and Vigilant, and under the influence of his visit abroad with the last, and of his experiments with small yachts, has produced a new type. The design and construction of Defender were radical experiments in their way, though very successful ones.

In the new boat there has been comparatively small need of experiment, but the designer has been able to work with comparative ease and certainty in changing one detail and another of the form and construction of Defender. All that is known about Columbia—and in spite of the strenuous efforts at utter secrecy almost everything of value is known—goes to show that she will be a marked improvement on the Defender of 1895.

If this were all it would give a promising assurance of the successful defense of the Cup, but in addition Defender herself is likely to prove much faster than in her first season. During the winter she has been thoroughly overhauled, all weak places strengthened, and her sail plan increased, until to-day she is probably much faster than in 1895. While Columbia will be manned by a Maine crew, Defender will be manned by Scandinavians, a bit of international rivalry that tends to make the racing of the two of greater interest and practical value.

If all goes well, the end of this month at the latest will see these two sister yachts, each in the best possible condition, racing against each other day by day with an improvement in the speed of each which it is impossible to estimate.

It is doubtful whether the average fast racing yacht in the large classes, with her very limited opportunities for racing with her equals, realizes her greatest possible speed by a very large margin; at least in her first season or two, after which she is probably outbuilt. In the present case, however, it seems probable that by the end of September both Columbia and Defender will be as near to perfection as is possible in yacht racing.

SNAP SHOTS.

THE milldam in Iowa is just what the milldam is anywhere else, an obstruction to fish. But in Iowa it is more than this, for the law declares it to be a nuisance, subject to be abated if the owner makes no provision for the passage of fish by providing suitable fishways. The statute has been vigorously resisted, as so many others are which prevent a man from overriding and destroying the interests of other people, on the ground of constitutionality. A Mr. Wm. Beardsley, in Mahaska county, dammed the Skunk River in a way to obstruct the passage of fish, and held out for his right to do so, through the lower courts, until the case at length came up in the Supreme Court, where it has just been decided. The decision was against him. The Court sustains the fishway law in these words: "Were we to hold the present law unconstitutional, so as to open the way for a riparian owner, whose land is on both sides of a stream, or two abutting owners, to, by a dam or other obstruction, prevent the passage of fish up the stream, and thus deprive riparian owners and the public of privileges as ancient as civilized history, the way would be well opened for innovations and surprises as to rights long enjoyed and of untold security. The streams and lakes are the natural abiding places for the fish. In them they cast their spawn and multiply their species. They constitute an important and valuable article of diet for the rich and the poor, and, with the ways open that nature has provided, they are accessible to both. If the lowest riparian owner of a stream may legally block the way of their migration, the consequences to result to the thousands are readily imaginable. The law that would permit it would be the entering wedge by which the few would profit at the expense of the many. Before we sanction such a rule its existence should clearly appear. The Legislature has kept itself within the settled rule, for that the act of obstructing the passage of fish against individual and public interests would raise a legal presumption of damage is too clear a proposition to be debatable."

This might almost be called an Adirondack number, since the North Woods furnish for it so prolific a theme. Mr. Hastings writes of a trouting trip into the wilderness, and between the lines of his story we may read what the North Woods, with their opportunities for recreation and their speedy approach, mean to a New York business man. Mr. McHarg gives a gratifying report of the fishing conditions, with a picture of an Adirondack trout catch, notable for the size of the fish. Mr. Spears writes of the influences and agencies which are menacing the woods and the public interest in them. There is also a report of the decision of the Court of Appeals holding invalid the statute making the Moose River a highway, the Court having based its opinion on the ground that the opening of the stream for the floating of logs was essentially for private advantage and not for the public good. Taken all in all, these several Adirondack papers have in them much suggestion of the condition of the North Woods as they are to-day, and as they will be in the near future. Whether or no Mr. Spears is pessimistic in his review of the situation, we do not share his apprehension respecting the danger of the woods being fired by men who feel themselves aggrieved because shut out from hunting or fishing districts. There are things which the average man may not demean himself to, no matter how urgently he may be spurred by revenge; and we refuse to believe that the Adirondacks have nurtured a breed of men who would fire the woods to "get even."

If there is any one privilege a human being might claim as an inalienable right, although not guaranteed to him by the Constitution of the United States, it is to enjoy the breathing of pure fresh air when he goes fishing. In fact, fresh air is one of the good things we are constantly talking about as among the advantages of our angling excursions; and it would seem as if there could be no excuse nor warrant for institutions which constitute themselves nuisances and poison the atmosphere for miles around, in those particular spots made by nature for a fisherman's outing. The salt water fishermen of New York city who resort to Jamaica Bay and adjacent waters on the Long Island shore have for many years been subjected to the outrage of a most unbearable stench from Barren Island. This is a bit of land near Rockaway which is devoted to the rendering of carcasses of horses, dogs, cats, goats and other animals from New York city, so that the fisherman in search of balmy breezes and exhilarating airs is often overcome by the abominable odors, and his fishing excursion is wrecked. A measure was introduced into the last Legislature providing for the abolition for this Barren Island nuisance. It passed both Houses and went to Gov. Roosevelt, who disapproved it because he thought the time allowed for the measure going into effect would not suffice for the municipal authorities to provide other means of disposing of the city waste. Although thus temporarily defeated, the endeavor to rid the Jamaica Bay district of this nuisance should not be abandoned.

Mr. Andrew J. Price wrote for the FOREST AND STREAM not long ago an entertaining paper about the custom which prevails in some districts of the South of cutting off the shirt of the hunter who misses his deer; and among other incidents narrated was one of a moot-court where the culprit was duly tried before receiving the penalty. In his notes to-day on mountain trout Mr. Price tells of a West Virginia fisherman who, when he saw a mother raccoon feeding trout to her little ones, constituted himself prosecutor, judge, jury and executioner, and incontinently slew her for what he was pleased to construe as theft of trout. Now if we had our way we would convene a moot-court to hear the cause of Raccoon vs. Man, and to determine righteousness in the case, whether the action of the raccoon in seeking sustenance for its young from the fish specially claimed for his own use by the creature who was given dominion over all living things was an offense which warranted an infliction of the death penalty. As Mr. Price shows approval of the action of the executioner, we should appoint him to defend the man; and the cause of the coon we should give into the keeping of Mr. Lewis Hopkins, while for judge we should nominate our Mississippi correspondent, Coahoma, unless it could be shown that his judicial poise had been marred by the coons which whicker in his cornfield of nights.

When is a trout caught? When you have him safely in your creel, of course, and the lid fastened down securely on top of him. A simple question and readily answered. But not so simple after all; for in one of the Pennsylvania courts they are in a judicial snarl over it. The Pennsylvania law says that "no person shall at any time catch or kill any speckled trout with any device save only with rod, hook and line, except for the purpose of propagation, under a penalty of \$25 for each offense." It appears that two Philadelphia anglers, Mr. J. Price Wetherill and Mr. W. T. Elliott, were recently fishing near Stroudsburg, when one of them was seen to land a trout with a landing net, whereupon information was laid against him for having violated the statute quoted, and trial was had before the local justice. Two witnesses swore that it would be impossible to land an average trout without the use of the net; and the angler's counsel argued that the hooking of the trout was "catching" within the meaning of the law, and that a landing net was "of the same class of fishing apparatus as a reel on a rod." The prosecution, however, contended that the mere hooking, or having a fish on a hook, was not catching within the meaning of the law; but the use of the landing net as acknowledged by the defendant was an employment of it for "catching" the fish, and that therefore the statute had been violated. The case went against the fisherman, and it is reported that it will be appealed to a higher court.

Until this case was brought to our notice it had never occurred to us that a Pennsylvania trout fisherman, who pretended to fine art in the game, would attempt to fish without a landing net. In fact we do not profess to understand how a fly-fisherman could get along without the net, that is to say, if he were using light tackle and the fish were sizeable. There are two classes of trout fishing with a rod. One is to use a pole and strong tackle with which the trout may be derricked from the water over the head into the brush behind. This is a method which does not involve the use of a landing net. The other is to use a light rod and light tackle, and to match one's skill of handling against the strength of the fish, and to save the trout by maneuvering and strategy, rather than by brute main force; and in this practice, as has been said, if the fish is a large one a landing net is absolutely essential. We are curious to know whether the landing net is not a recognized article in the equipment of the trout fisherman everywhere, the Keystone State included.

Mr. Hofer's report of the Montana winter lingering in the lap of spring recalls a National Park story told to illustrate the amenities of the Yellowstone climate. In a Livingstone court a woman witness deposed that she had been living in the county "most of the winter," and pressed further replied that she had "been here a little over eleven months." It has been a hard winter on the game, as Mr. Hofer's notes have shown. Yet severe climatic rigors the elk and antelope and sheep have always had to contend with. No matter how severe this natural tax on the vitality of native species, the game will take care of itself. For mild winters alternate with severe ones; nature preserves the equilibrium.

What the game of the Rocky Mountains cannot stand is such a drain as is made upon it by lumber companies who find elk meat cheaper than beef for their lumbering crews; and by communities which systematically and continuously violate the protective statutes. If the reports which come to us from Jackson county, Wyoming, are well established on fact, as they appear to be, there is gross dereliction on the part of the authorities there. We invite the attention of the warden of Uinta county to the communication in our game columns to-day.

The Ontario authorities have promulgated an order prohibiting net fishing in the waters of Georgian Bay from Saw Log Point to Bustard Islands, the line running on an average from two to three miles from shore. As is well-known to those familiar with the district, the protected waters are the spawning grounds of fish, and the temporary privations complained of by the net fishermen will certainly be more than compensated for by the increased supply of fish the new regulation will insure.

The Sportsman Tourist.

Pioneer Days.—III.

Progress Through the Wilderness.

BY ROWLAND E. ROBINSON.

WHEN they set forth in the gray of the frosty morning there was no one else astir in the inn, but as they looked back the breeze moved the long tail of the panther on the sign post and gave the tawny monster a semblance of vigilant life as his white fangs gleamed out in the direction of the land of the enemy. The patient oxen swayed along their leisurely way, the men sometimes in the cart, sometimes plodding beside the team, or Kenelm flanked it in the wayside woods, with rifle ready for a shot at partridge or pigeon.

Now the road, seamed with ruts and laced with a network of gnarled roots, scarred and worn bare by hoofs, wheels and rain, ran through a forest that looked as ancient as the world, its hoary moss-clad pillars rearing their branches above the decay and ruin of innumerable predecessors—life perpetuating itself by death, as nature ever does and as eternity makes itself unending. The clatter and rumble of the cart and the shouts of the driver echoed far along the palisaded thoroughfare with rebounding crash of reverberation, that overbore the tinkle of sylvan streams and rustle of wind-swept leaves and scared the timid wood folk with unnatural noises.

Now there was a clatter of hoofs behind, and the two Allens came up, gave a word of cheer as they passed the crawling oxen and went clattering and splashing out of sight and hearing with their lesser echoes. At noon our travelers came to a small clearing, crude and uncouth with the newness of its hewing from the wilderness, log heaps and stumps dotting the stubble of the recent crop and sharing the ground with the shocked corn. The bark-roofed log house had its primitive plumping mill; a hol- lowed stump, spring pole and pestle. Its out-door oven, like a mud beehive, gave them hospitable welcome through its open door to the wide fireplace to cook themselves a dinner, which was, in fact, shared by their entertainers, while the oxen were made free to a full feed of un-threshed oats. Such was the hospitality of the olden time, sharing the little it had with every comer, and asking as freely as it gave.

Coming to no such friendly shelter at nightfall, Kenelm and Josiah made camp beside a brook, supplying themselves with a goodly store of firewood, for it was a dismal camp ground. The wolves began a hideous concert all around them as the shadows of night descended upon the wilderness, and then behind the black curtain the wail of a panther rang stealthily, circling about the fire-lit center wherein the frightened oxen trembled and the sleepless travelers watched and fed their comforting companion, the fire.

So passed their days and nights, barren of incident almost to monotony, except for such slight mishaps as were common to pioneer travelers.

One day a bear, shaggy, black and shining in autumnal pelage, slouched into the road before them, and itself in a flurry of alarm at the unexpected encounter, frightened the oxen almost to an overturn. While Josiah held the team steadfast, Kenelm ran forward and killed the brute with a well-aimed rifle shot behind the shoulder, and then getting the oxen past it with some ado, they loaded it upon the cart and journeyed on with their trophy to the next frontier hamlet, where it was readily exchanged for some needed additions to their stores.

Anon, they heard the mellow baying of deep-mouthed hounds drawing near and nearer from the hills, and halting where a pond broke the many-colored expanse of forest on the left, when the hounds were closer than the melodious echoes of their voices, and standing alert with ready rifles, an antlered buck bounded into the space before them, and at the double report of the guns plunged headlong into the painted thicket, dying the crimson leaves redder with its blood. Then the gaunt blue-mottled hounds came up and guarded the quarry so fiercely that the slayers were forced to stand off until the panting hunter came upon the scene, a sturdy man of the woods, who made fair division of the spoil, and added something for the unstinted praise of his hounds, which he assured them:

"They'll foller anything from a painter down to a Yorker and a skunk, which be the meanest things in all my knowlege o' man an' natur'." This was Peleg Sunderland and his hounds, which afterward became so famous in the hunting of Tories.

Toward the close of a somber, half-rainy day, when there were no shadows in the woods but a universal gloom, and the only light seemed to come from the yellow and crimson poplars and maples and fiery pepperidges, and when the dusk of evening descended and they had not found a suitable camp, a pack of wolves began trailing them, howling hungrily and calling reinforcements, until the road behind was dusky with the gathering throng. Josiah kept beside the oxen quieting and encouraging them, while Dalrymple sat in the car facing backward, with one rifle across his knees and the other in hand to keep the pack at bay should they become too threatening.

At the first slight opening where a brook babbled along its pebbly bed and spilled itself into pools over obstructing logs, Josiah stopped the team and plied his axe lustily to get firewood from a fallen tree. Then firing some punk with sparks from flint and steel, he soon had a cheerful blaze of splinters, and then a roaring fire that licked and tossed the overhanging boughs and drove darkness and shadow into the circling gloom. Kenelm, firing his rifles in quick succession into the thick of the pack where glaring eyeballs shone and white fangs gleamed hungrily, sent the gaunt brutes snarling and whining into the cover of darkness, all but three that were found lying stiff and stark in the road next morning, and added to the trophies already in the cart.

Another evening, when similarly delayed in finding a camp, a panther prowled beside, sometimes seen in tawny glimpses or glare of baleful eyes, now the stealthy footsteps stirring the fallen leaves, now leaping a prostrate log, or unheard as its soft pads touched softer moss-

clad trunks. Kenelm kept vigilant guard, afraid to shoot for fear of wounding, until a camping place and fuel were reached, and the unwelcome attendant slunk away, spitting angrily and then catterwauling afar off.

"If we had that feller's pelt for a sign, we'd get us a keg o' rum an' go tu keepin' tavern on aour pitch," said Kenelm.

"You'd sell tu me one day, an' me tu you the next," Josiah responded. "But I'd rather not keep tavern if I'd got tu git the sign."

"You'll git used tu all these 'ere varmints afore your year 's up, boy, an' thank your stars they haint Injuns, which is the b'iled daown black salts o' hell itself."

One day as they were traveling along the forest-bordered road they saw a man moving slowly at some distance before them, carefully feeling his way with a staff. As they drew nearer he got cautiously out of the road and awaited their approach with closed eyes turned toward them. "Good folks, be you goin' so far as Manchester?" he whined dolorously.

"Yes, and beyond," Kenelm answered.

"Wal, then, wouldn't ye jest as lives let a poor blind man keep along wi' ye fer company, an' guidin'. If ye will, I'll ask the Lord tu bless ye, an' I know He will."

"Sartinly, an' you can ride in the cart if you're a min' tu," said Kenelm, and helped him to mount, and in doing so noticed the butt of a pistol sticking from his pocket. "But what be you a-doin' wi' a pistil? I never heerd o' blind folks shootin'."

"Wal, I didn't know but what I might, at clust quarters if any varmint tackled me, an' it's sort o' comp'ny. I could fire it if I got lost, an' mebbly fetch somebody 'fore I perished."

"That is a good idee," said Kenelm. "An' haow come ye tu be on sech good terms wi' the Lord 'at He hes ye sarve aout His blessin's?"

"It's turrrible lunsome in the dark, an' I commune with Him in spirit for company."

"That's another good idee, tu," the old ranger said.

"Where be you cal'latin' tu stay tu-night?" the blind man asked, after a little feeling of the things in the cart.

"It depends on where we git tu. Properly we shall camp somewheres."

A gleam of satisfaction passed over the man's face. "I'm glad on 't. I lufter camp aout. The sight—I mean the feelin' an' smell an' noise of a camp-fire doos me good. An' you got pork in this 'ere barril?"

"Yess."

"An' Injun meal in that 'ere?"

"Yess."

"Gosh! Provisions enough tu keep a fam'ly all winter. An' them wolf-pelts wi' the baounty 'll fetch ye thirty Spanish dollars tu Manchester. Be they expectin' of ye there, any o' your folks?"

"No, we do' know a soul there," said Kenelm, who, happening suddenly to turn his averted face upon their new acquaintance, caught him regarding him with open eyes and a hungry, crafty expression upon his countenance, but feigned to take no notice of it.

They made camp early in the first suitable place they came to, and as they were preparing it Kenelm found an opportunity to whisper to Josiah: "We want tu keep a sharp eye on that feller; he haint no more blind 'an we be!"

Having got a roaring fire started, they cooked and ate their supper, then spread blankets and quilts underneath the tilted cart and crept into their beds. Kenelm Dalrymple and Josiah feigned sleep, as did their companion, who, after being assured that their slumber was sound, began cautiously creeping from his bed and went out to the fire, where, watching through half-closed lids, they saw him examining the priming of his pistol, then get the axe within reach, casting frequent stealthy, backward glances at the supposed sleepers, whose snores still increased in volume. Now, as the scamp crouched again to make sure of flint and priming, Kenelm cautiously laid off the blankets and crouching like a lynx for a leap, sprang at one bound upon the shoulders of the plotting thief, and bore him face down upon the earth.

In the sudden onset the pistol was fired, the harmless bullet scattering abroad a shower of ashes and embers. Kenelm wrenched it away, and tossed it over to Josiah, who now came forth wondering at all the sudden commotion.

"Fetch a rope an' tie the devil's hands," Kenelm panted, sitting on his adversary to regain breath.

This done they bound him to a cartwheel, threw a blanket over him and resumed their own, and slept soundly till morning. In the morning they dragged the shivering wretch to the fire, warmed him, fed him and turned him out upon the road with a parting admonition from Josiah: "Now, you skunk, go your ways, an' remember us for hevin' wrought a meracle on ye, in restorin' your sight. Don't seek us no more, for if you run acrost us ag'in, it's more'n likely we'd turn ye deaf an' dumb, as well as blind."

Then they went their way, coming to Manchester, and to Socialborough and Fort Ranger, where they bade farewell to their kind and entered upon the long, lonely journey to the Little Otter.

Their route now lay for the most part along the banks of the Great Otter, now skirting long, silent flowing reaches, now noisy rapids and booming cataracts, here the gorgeous forest reflected branch for branch and leaf for leaf in the glossy water, except as otter or wildfowl broke it with an arrowy wake, there shattered into a thousand flecks of every color where the torn current reached down the long incline of rapids, or leaped in a white tumult of foam down a wall of rock, and sent far down the watery lane and far into the hushed forest the tremendous thunder of its plunge.

So without further adventure with beasts or men, they came to the Lower Falls of the Otter, called by the Wau-banakees, Ne-tah-me-puntook-Peconktook, and here crossed on the gathered driftwood to the right bank, where they found one Pangburn established and preparing to build a sawmill, yet in constant fear of the Yorkers, who held a claim here under a New York charter. He was to be their nearest neighbor, and they bade him good-by with a promise on the part of each to visit each other soon.

Next day they came to the Little Otter, and crossed it

on a rude bridge at the chasm of the Lower Falls, where they found a Quaker surveyor, Timothy Rogers by name, who directed them to their pitch, though he doubted the validity of the title, he being proprietor's clerk, and having no record of its sale to Anthony Capron.

"I'm afeared somebody 'n other 's b'en a-playin' of thee a trick, young man," the old surveyor said, consulting a map which he spread upon a stump. "Thy lot, seventy-four, was drawn tu the right of Nicholas Delaplane, an' I don't find 'at he's sol' it tu anybody. Haowsomedever, thee can go on an' make betterments, an' I think Nicholas 'll allow thee what's right for 'em. He's a member 'mong Friends."

"This 'ere 's one o' your man's mill-seats, Josier," said Kenelm, pointing to the white cataract roaring through the narrow gorge, "an' it haint wi'in three mild o' your pitch, an' the one on Lewis haint no nigher. That shows the critter's a liar, tu begin with." With some misgivings they turned their backs upon the surveyor and the forest-muffled thunder of the falls, and made tedious progress over an abominable road toward their destination.

After a long search they found the corner tree marked on four sides with the numbers of the lots, among which was lot seventy-four, a low-lying parcel of land bordered by the marshes of two streams on two sides, and heavily timbered with pine, hemlock and many kinds of deciduous trees—all giants of the ancient days. They made a shelter for the night, turned the oxen loose to feed along the edge of the marsh, and then slept the heavy sleep of weariness after an accomplished labor.

"What Luck?"

If you wish to listen I am willing to tell you why and when and where we spent a few May days. As to the why of it, speaking of myself, I would tell you that my visage was distorted with neuralgia pains caused by strained eyesight in looking for business profits, but when you are telling others of your pains they have a far distant look, and break in upon your tale of suffering and inform you about pains of their own. Let that part go. When friends talk of the woods and streams it is to me like shaking scarlet at a male bovine, and yearnings that are latent are aroused, and forgetting all else I am off.

We took the Hudson River steamer Adirondack, or rather it took us, and New York backed away as the sun went down behind the Jersey Palisades. To our discredit, we allow the Palisades to be destroyed. The general ticket agent, Genial Jack Allaire, advised Capt. Roe to go past Sing Sing under forced draft and "let no guilty man escape." This steamer Adirondack is a great boat and grand withal. It has a length of half a mile, including the wake, and an enormous beam; then there is the beam of the searchlight, and often we are a beam of the shore and canal boats; the moon beams o'er the waters, there is a beam in the eyes of friend Crippen and a mote in mine. A puffing tug snorts off out port quarter and the three vertical stern lights tell us there is a tow behind. There are four decks, and Trimpi has a poker deck to swell the total and his purse. The dining room is on the street floor, and the kitchen is in the basement: way up in the back garret is a roof tank where they keep all kinds of water, Saratoga, Poland, Apollinaris and fire. Ever been there? The water and the price are high, and if there is any balance the waiters are willing to keep it. The dude walks the carpeted decks looking for friends, and the bellboys see that no harm befalls him. The saloon is open all night, and if any one is sleeping in the chairs after 12 he is not disturbed. There is a tie-up at Albany in the morning. There Col. and Gov. Roosevelt has taken another hill, where a few years ago one disappeared. The silk-hatted jehus importuned us, and for a slight consideration we were transported across the city. The cars have a pull, and we bowl along the banks of the North River mile after mile. Many logs float down stream, others are jammed in the current for a while, only to be jammed later in the pulp mills below. The meadows are dotted with the yellow blossoms of dandelions, buttercups and cowslips. The hills show all shades of green from that of the pale poplars, tamaracks and birches to the dark of the hemlock, balsam and spruce. The bossie calves butt each other about the barns as we speed by, and apparently the fussy mother hen from her barrel-staked prison warns her puffy yellow offspring to keep out from under the wheels of the modern juggernaut. Where the mouth of the North Creek is lost in the bosom of the North River, the railroad ends, and if the cars did not stop there "the devil would be to pay."

We take a stage for the next stage of the journey, and anon the loquacious driver tells us as we come to a bridge that last week a team and six people drove off the bridge. With a look of horror Mr. Burnham asks how it happened. The chuckling hayseed said, "They drove on and they had to drive off." Mr. Close said, "A close call," and Chicken Legs said, "Chestnut." For lunch we stopped at a wayside hostelry, and when I entered the office the same old sights and remembrances were before me as are seen in hundreds of such haunts of the sportsman. There was the air-tight stove, the agreeable smell of the burning birch, blended with the disagreeable of the stale tobacco. There was a picture on the wall of the city sport standing proudly beside the suspended deer which the guide had shot; a wood-cut of the stallion and words below telling where he was sired and dammed. Discolorations above the chairtops are seen on the wall where the bear-oil anointed heads of the rural experts rested. The whole recalled to my mind a winter evening after a day of fox hunting that I was forced to spend in just such a place. A rural nimrod (he was slim enough for a ramrod) told how he cut loose with the right, "Bang she went," and then with the left, "Bang." To make it more vivid, he stood up and gesticulated the synonymous motions. A jealous rival called him a liar, a fight ensued and peace came with an all-round drink, and the winter evening ended as they went to their respective homes in the snowy paths.

We have digressed a little, and to go back I would tell you that lunch is ready. We filed into the dining room looking intently for country produce, and we found it, but like Mr. Dooley's fruits of victory, it was all canned. Oh, yes, they still "carry coals to Newcastle." Some-

one called for a pint of claret, and the bulging blue eyes of our German friend, Trimpi, bespoke astonishment. "You call for wine and expect the rest to pay for it," he said. "You have been drinking rainwater at home all winter, and glad to get it, and now you call for wine—wine—wine. This is no junketing trip of aldermen; you go without." Trimpi is an odd genius and very serious in some things, and several times he hurt my feelings.

We resumed the stage ride, and the sixteen-mile drive brought us well up into the Adirondacks. Just over the iron bridge at Indian River two double buckboards were waiting, as previously arranged. Now about buckboards. They look as innocent and as calm as an army mule, and like the mule, they act like the mischief in a tight place. I have ridden buckboards and bucking broncos, and don't know which was named for the other, but do know that one will throw you as far as the other in their gayest moments. We followed the course of the Indian River as near as the rough country would allow for four miles, and if we had moved directly in its channel we could not be more wet or muddy, inasmuch as it was raining heavily. The off hind wheel had a scoop like a steam dredge, and I was the scow that received the contents when that scoop came up. Trimpi was beside me, and beside himself with delight when a mud plaster hit me in the neck, but his joy was brief, for I was quietly transferring the deposit to his pockets, and had them nearly full when "Hi, there!" my wheel went into an abyss and his climbed a ledge with a suddenness that left no time to catch at straws. As he went past and over me he grasped me lovingly around the neck with both arms and we went on our way down that soily hillside and into the brush in fond embrace as though nothing but death could part us, and that seemed possible. A valise sailed by, then a bundle of fishing rods and umbrellas, and Trimpi's hair trunk hovered in the rear as though to telescope us. We brought up against a rocky stump, and when still in deadly embrace, Crippen yelled, "Hoch der Kaiser." My little knowledge of German came to my aid, and understanding that "Hoch" meant elevating or high up or something of the kind, I rolled my Teutonic antagonist on top. I was "the under-dog in the fight," yet there was a "method in my madness," for the hind wheels of the buckboard were playing teeter above as though undecided whether to drop back into the ruts or to crush the remaining life out of us. In the latter case I needed protection more than a Republican. Referee Crippen said "break away," and we did it. We got up and eyed each other like a pair of game cocks; I called him a gray-haired old blunderer, and he called me a bald-headed pile driver, and we were ready to clinch again, when Crippen stepped in and parted us. Trimpi said, "Blessed are the peacemakers," and I thought of the other blessed ones who shall inherit the earth and wished they might call for that portion that I had accumulated in my peregrinations down the muddy hillside with that flying Dutchman. Easy now, Mr. Trimpi, don't get angry; you know that you were to blame.

We righted things and resumed our way, and when again bad places appeared ahead Trimpi would dismount and command me to lie down. We changed from the course of Indian River to that of the Cedar, and at the base of Dun Mountain decided to climb over rather than go around with the teams. Trimpi was in the van, and with a German's love of music his rich tenor voice cheered us on as he sang "Onward, Christian Soldier." Then he would whistle or chaff back at the hoot owls. "There's a pleasure in the pathless woods" (in the day time). What poetic natures call the gloaming had merged into one of Egypt's plagues, and we slid, stumbled and blundered down the slope until at last the surface of the Third Lake of the Seven Chain Lakes and the lights of Landlord Hutchins' log cottages were "forninst" us. The bright fire cheered and dried us, and our pelts were stretched around the festive board. After supper we unpacked and spread our canvas, corduroys, rubber coats and boots about. If creased trousers indicate style and taste, and patches mean poverty or penury, you could take your choice. The creases ran in all directions, and patches were where most needed. To-morrow will be rag time, and we will have a rag-time dance on the waves or a May-pole dance on spongy green moss and around some towering spruce. The beds yawned and the contagion spread to six fishermen. Taps are sounded and we dream of trout and trailing arbutus till reveille. I often have to "take water," but prefer the land, so while the others fished I hunted among the trees and hillsides for wild flowers, and found them too: cowslips, the magenta and white blossoms of the birthroot, dutchmen's breeches, violets, wintergreen berries, arbutus, mountain laurel and scores of others with names unknown to me were in the bunch, and as I sat on the lake shore admiring them and wishing that others could enjoy them also, the clear notes of a bobolink burst out from the blossoms of the swamp maple at my side, "Bobolink, bobolink, spink, spink." Many years had elapsed since I last heard one sing, and often had I hoped my defective ears could once more register that song. It carried me back to the days when, as a little freckle-faced, pug-nosed, bare-footed country lad, with one gallus, a battered straw hat, the hives and a stone bruise, a peeled alder fish pole and a mustard box full of fish worms in my pocket, together with marbles, jackknives, nails and twine, I wandered down the brookside after pickerel. Those were days when they cut my hair with sheep shears around the rim of an inverted tin pail, as it rested upon my ears; days when Rube Hendley drove me from his land and said to me, "Ef I ever ketch yer here ag'in I will shake yer till the taller flies all around taown." In those days we boys made black finger rings from gutta-percha buttons, baskets from peach stones, and kept our extensive library of Beadle's and Monroe's dime novels up on the beams of the Baptist horse sheds. In the winter we rode on the ox sleds where the side-hill plows were fastened when the roads were broken out. We jammed each other in the snowdrifts and pelted the schoolmaster with snowballs. When the skating was good we stuffed the schoolhouse stovepipe with paper and smoke closed the school, and Jim Clare, the tinman, never went back on us—but "that is my private business."

Next day I fished, and Kit Clarke isn't the only one who knows "where the trout hide." Most anyone can tell big fish lies, so I will only take a little space and that

is shadowed in the valley where the Second Lake water seeks the first. It tumbles and filters down through the wind-fallen tree trunks, over stones and into swirling pools beneath the overhanging brush. There is not room enough to cast, and whether the trout would rise to a fly or tumble to a worm, I did not know, but they were there, and the rod with only 4ft. of leader and snell was poked under branches, and as soon as the lure touched the ripples I felt a tug, and then snapped the hook well in. The trout tried to dart under the log, but was led away and down the stream, and eventually into the net. If you were told the same thing sixteen times in less than an hour, you know it all, and if you could see where the loop of the net rested, just enough above the water to keep the trout in and alive, and then should you expect, as I did, to hear some oracle say "enough," and with a sense of fairness help me to restore the smaller ones to the stream and still have 10lbs. left, you would know what joy is. Oh, climb up the bank with me, breathe in the balsam-laden air, bite at it, get all you can, for it is rare.

Out there on First Lake where the stake stands up from the surface, we tied the boat. The spot was baited with chopped chubs, and with a live one on a double snelled No. 1 sprout I soon hooked a heavy "laker." He made the steel rod form parabolas, and as he darted hither and yon his own kind around him must have thought him erratic. I think most of us mistake in peering into the water for a hooked fish. Just watch the spring of the rod and direction of the exposed line and study the science of it all.

Mr. Crippen is a fine gentleman and angler, and one of those open-hearted men who enjoy the success of others fully as much as his own, and it pleased him greatly to think that we could so enjoy ourselves in accepting his invitation to the trip. I had not met Mr. Trimpi before, and may not meet him again, but I place him in memory as the jolliest type of sportsman I ever met—one that can give and take a joke, and to even up with him I want to say that as he sat in his boat off shore in the evening and lit his pipe with "vind" matches, and as the flames lit up the scene, the outfit looked like a German tramp steamer in distress and burning Coston lights.

Fishing parties divide usually, and the others were away on Cedar River most of the time. They propose to erect a grand stand there another season and charge for tickets to the exhibit of skill. The landlord's daughter landed a 4¾lb. brook trout, and practically whipped us all when she whipped that stream.

There is too much that is grand in that wild country to stay in one place long, and to improve the chance to see more I left the others with regret and started on a long jaunt through to the western exit of the region. They call it going in and coming out, and it reminds you of the words in Sol Smith Russell's song, "And the worms crawl in and the worms crawl out."

A buckboard ride of twelve miles to Indian Lake, lunch, twelve miles more on a good road with a light team, and I was at Blue Mountain Lake at 3 P. M. Often on the drive I stopped at some cabin or farmhouse to obtain a glass of milk, and invariably the good woman who answered the driver's knock hid behind the door as she readily complied with his request and handed out the best pitcher in the house. Coin would be left with her and a message of thanks, and as we drove off I would turn around and see the kindly face peering at us from behind window shades. Others have noticed this. Why do they do so? They need not fear the sportsman. These good country women are the salt of the earth, and their mothers, grandmothers and great grandmothers have furnished the backbone of this blessed country of ours. The little tots hanging timidly to their skirts are the stuff that Lincolns, Grants, Deweys and Roosevelts are made of. Come out and see the sportsmen. We do not expect to see the latest styles or to see artificial formations. What we admire is the plain, simple life—the manners free from artifice or affectation of any kind, and the faithfulness to home duties.

Fortunately one of the best Adirondack guides, Will Kelly, was at leisure, and entering into the spirit of the idea and his canoe we started off to bring up where night and conditions might allow. It was a May day, sunshiny and warm. Not a ripple on the lake other than those caused by skimming swallows or leaping fish. The gigantic upheaval of rock and earth on the right called Blue Mountain conveyed no impression of the blues. The trees on the shores are reflected in the water and seem to be growing downward from their real stateliness. I was thankful to the "powers that be" that I was alive and endowed with at least a partial sense of appreciation of nature undisturbed by man's meddling. Man's work does not always deface, however, and in proof thereof we passed under the bridge spanning the connecting link between Blue Mountain and Eagle lakes. Costly granite abutments support a rustic bridge, and underneath on the facade of masonry rests a bronze tablet fittingly commemorating the efforts of Durant in projecting the first transcontinental railway. As we glide through Eagle Lake the beauty does not fade; it improves rather, and thoughts come to me of the feelings of one born and reared among the city confines and suddenly dropped upon yonder peak without having previous knowledge of these surroundings. When he first looks upon the wonders of nature his untaught imagination gives birth to weird fancies. The living things peopling the air, the streams, the forests and the mountain chasm are to him unknown, and he shrinks from them in timidity. Just awakened, as it were, and feeling his helplessness, he is ready to cry out for succor. As his gaze falls upon the clear surface of the lake and he sees his own kind upon its face, he borrows calmness from it. Gazing above him into the blue expanse, he sees an arch that to his heretofore limited vision seems endless. As the bright clouds flit along the skies and the pure air kisses his face, he, if his soul is in it all, exclaims, "God is good."

In thinking of others, I forgot myself, and the sight of two lads fishing from off a shore boulder cautioned me to look about. With a whoop like that of a dismissed schoolboy, one of them with a pole fit for log driving, yanks a splendid trout into the air over his head and into the forest behind him. How I longed to get at those boys and initiate them into the mysteries of a 50z. rod. But they might resent it all and call me names.

From the western portal of Eagle Lake we enter Uto-

wana and find it the equal of any. The guide hears deer passing on shore and recounts to me tales of many seasons of his vocation, and as he talks vividly, I understand that his pursuits are not all mercenary. Such men are the best of guides. At the end of the lake there is a half-mile carry. I bear the canvas pack and grips; the guide bears the yoke and his canoe, weighing 75lbs. With a heave and a swing we start off on a pilgrimage to a shrine of golden sunset somewhere beyond the Marion River. On the path and in the shade of oaks rested a cow and young calf, and probably they belonged to the owner of a lovely hillside house on the left. I was struck with the appearance of the calf, and nearly struck by its mother. The little fellow was whiter than "beautiful snow," excepting on each end, and I walked carefully up to him to extend a caress and look into the soft eyes. I did not get close. Something in the eye of the watchful mother, such as you have seen in the look of a prospective mother-in-law before you had declared your intentions, admonished me to retreat, and I did so, but not in good order. Let me tell you that it is no cakewalk when you flee from a maddened cow, when you hear the prods of cloven hoofs behind you, and see lowered horns and erect tail over your shoulder. But the good guide saved me, and I believe the sight of a native, or perhaps the boat in midair, soothed the beast, and then I panted in peace. Will Kelly said, "You seemed interested a moment ago. What was the trouble?" "Mr. Kelly, I was admiring that white calf. You don't see them in white often nowadays. They are mostly multi-colored or in black, fast black, too, and warranted not to crock. Mr. Kelly, 'twas ever thus from childhood's hour; I've seen my fondest hopes decay; I never loved a young gazelle—oh, I am away off; this was a calf."

From the dock where the little steamer leaves, we entered the Marion River—a river that for sinuosity beats a snarled fish line, or for crookedness the machinations of Mephistopheles. Twisting in and out, running north, east, south and west, and with imaginable shores, it is the home of millions of bullfrogs, and they keep up a perpetual carillon of croaking, as if in greeting to the first city swell (?) to pass into the hands of preparing hotel-keepers. Muskrats, blackbirds and otter abide there, and for jacklight cruelty it is an ideal place.

Across the lower part of Racquette Lake we saw the Antlers, and I wondered if Landlord Bennett would take me in. I was in rough dress, sunburned and unshaven, and I pictured myself as old Hoss Hoey in "A Parlor Match." On the landing there were boatmen and boats. In one boat, half filled with water, there were scores of fish that to me were unplaced in name. They had a different appearance from any heretofore seen. If you wish for information and care to disclose ignorance, ask questions relating to other matters, and you will be told what you really wish to know. They were suckers, and I learned that they were chopped up and used to bait the buoys for lake trout fishing. At Racquette Lake they use suckers for bait; in New York City they use bait for suckers, and the racket is different, but they bate the boys just the same, and inasmuch as we are told that a sucker is born every minute, the process will probably go on until the "game laws" intercede.

I approached the office of the Antlers, and as I stood before the Boniface with uncovered head, he scanned me and consented to keep me. I believe my expanse of brow, or reach of forehead, saved me, and I ate at as clean a table (and I cleaned it more) and slept in as nice a bed as can be found anywhere. This is an elegant spot for good Americans to pass the summer months. Bennett could earn a big salary as a landscape gardener. The cottages are little castles. Someway I like the man: he is a sportsman too, I think, if trophies, guns and ears that have been frozen mean anything. It was grand to hear him speak in praise of Fred Mather—some kindness of the Colonel's in years past, I think. Did your ears tingle out there in Winsconsin, Colonel, about the middle of May? We were talking about you then. I also met a young Government surveyor, Mr. Bumstead, whose work is around and about this locality, and enthusiasm and correctness were plainly disclosed as he described his labor to me.

We went away the next day and passed the hut of old Trapper Dunning. Eighty-six years old, and as lively as a cricket; he pulled a 17lb. "laker" from Eighth Lake of the Fulton Chain the week before; he shot the last moose in the State, and believes that he has trapped the last beaver. Through the labyrinths of Brown Tract Inlet for four miles we passed, and then carried one and one-half miles from there to Eighth Lake, and I approached my old deer hunting haunts. A drive of seven miles to Eagle Bay on Fourth Lake and a telephone message around to Hess Camp brought a boat to take me over, and I knew "where I was at." If you wish to go where I did and in an opposite direction, take the Adirondack Railroad to Fulton Chain, change cars and a few minutes' ride lands you at Old Forge. In season steamboats will carry you through a paradise to the head of Fourth Lake. If you wish to drive over the new road to Eighth Lake, stop at Eagle Bay; but if you prefer to pass Fifth, Sixth and then Seventh lakes, stop at Hess Camp.

My good friend and guide, Delmarsh, met me, and we planned for October hunting days. He is to build a new camp away out in the forest for me, and says that I may have a box stall. I will be wid ye, Archie, in October—Divine Providence and cash permitting.

A little mite of a woman caught a 6¾lb. lake trout, while my largest catch at Fourth Lake was less than 1lb., and I quit fishing. Everywhere I went I ate trout; I had to. They did not ask what you desired. I simply had them thrust upon and into me till I wanted to swim all the time and my sides began to be speckled. The scales showed a gain of 10lbs. in ten days, and I took the back trail for home and codfish.

After a few days spent in gathering neglected ends, I was on the firing line once more, and had time to read. In perusing late editions of FOREST AND STREAM I noticed that some of its readers commented most kindly regarding the little brochure in reference to the schoolboy. I did not expect that what I wrote in an unstudied way would move anyone to the extent of carrying them back to earlier days. It seems that some were so moved, and I think no harm was done. When we reach a certain age

we seem to know more about the past than about the future, and we look back for something lost—boyhood days, the old home, father and mother, brothers and sisters, friends and incidents are recalled.

It may be sentiment to reconsider the past, but to the country-bred boy that sentiment is sacred. There is no home like the boy's home. There is no spot like the spot on which the man is born. There it is that every scene is imperishably fixed on his memory. There were his playground and his school, there the little church to which he went, there the paths his father and his mother trod. Nowhere else will he ever know who lives under every roof, nowhere else will linger so familiarly the names of the neighbors. Though years and oceans separate him from it, always in his heart is the thought that he will some day return to it. When he revisits it there are more familiar names on the gravestones than familiar faces in the street, but the roadways and the lilacs, and the sweet-brier and the wild rose, the grass of the fields, the kiss of the west wind, the shadows of the clouds upon the meadows, the cool fragrance of the woods—all these are the same; they have not changed, and the soul of the old playmates and schoolmates is still in them. Though their outstretched hands have crumbled into dust, the neighborly sympathy is in the very air and cannot be lost so long as that breathes. The longer he lives, the closer is the tug upon his heartstrings to lavish on the old home some expressions of his love. And that is what I'm thinking of at this moment.

W. W. HASTINGS.

Adirondack Ruin.

Editor Forest and Stream:

I returned the other day from a trip to the northern part of Herkimer county, N. Y. I did a little fishing, tramped through the woods and saw nearly all of my friends in the vicinity of Northwood. The boys all had something to tell, chiefly about deer hunting and other exclusively forest topics. What they said was not altogether pleasing, nor was all that I could see inspiring of hope for the preserving of the game and the game covers. I got a letter from my father, who is at Northwood, on June 3, after my return. He said that the woodsmen in Wilmurt are talking of setting fire to the woods this summer and burning as much of the country as possible. I heard considerable of this talk myself, and there was nerve behind the talk to apply a match to a brush heap or two at the foot of some hill. The men who talk this way are not guides, but woodsmen. They have been insulted by men who seek to keep them from following the public highways of the country, and from hunting on the State lands where game is to be found in any considerable quantity.

The woods are in very bad shape. I saw a mile of spruce pulp logs boomed in the West Canada Creek at Hinckley. The logs were from 1 ft. in diameter at the butts down to 3 or 4 in. During the half-dozen years just passed the same boom has been jammed yearly with logs. At first it was spruce saw logs culled from the woods in scientific style. The butts were alleged to be a foot or more in diameter. The supply of spruce was going to yield a perennial harvest, it was stated, and the woods would last forever under judicial harvesting. I suppose the pulp logs are taken out on the same principle.

"Culling" the woods is getting to be a regular mania. Actually the only woods thing not worth culling seems to be the blackberry briars. It is said the ferns are better for a little trimming, the partridges thicker because of a little killing of the old birds, the deer better off if the big bucks are killed, and the trees better for a little culling.

The "scientific" culling of the spruce forest, as carried on in all the western part of the Adirondacks, is something to wonder at. This is the first result I have noticed. In dry time there is only about two-thirds as much water now in the West Canada Creek as there was ten years ago. In high water there is more.

All the softwood saw logs in the West Canada Creek watershed have been cut out. That left big gaps on the hardwood ridges. The sun reached the ground in places and there the springs dried up. The dead tops are as tinder. Is there any wonder that the streams are withering?

But pulp wood is soft wood only. The problem how to do some more culling was ever present. What could be done with the great beech and maple trees which cover a large part of the rocky Adirondack hills? The idea of transporting them by railroad naturally came. The mills which cut up all the spruce were handy to the railroad. But the railroad wasn't always handy to the hardwood. The woods are cut through along the western side now by a railroad, and so the hardwood is easily transported. The big birch trees are going first. Birch is very ornamental, especially for ceilings and doors. So the birch goes now as fast as the saws will take it.

It appears that with just the birch being "culled" the woods were still able to hold their own, or else they didn't go fast enough; the trees still crowded each other with natural barbarism. Such wilderness is now being done away with by civilizing processes.

The woods five miles above Northwood are nearly all hardwood. A hundred years ago a fire swept over that district. A part of the burning still remains open. The charred logs lie where they fell. Briars and ferns cover most of the open, but poplars, wild cherries and other trees are taking root in all parts of the clearing, and woods bid fair to grow where the burning was not already redeemed. On all sides of the burning open there is a dense second growth of tall slender birches and maples. It is so close in places that one can travel through it only with difficulty. Around this second growth is a fine forest of hardwood, with hardly a trace of the old burning in it. Here and there are rocks scaled by the heat, little bunches of second growth and occasional patches of briars as bad as barbed wire. It is a fine cover for game.

The eye of an excelsior-making man caught sight of some of the trees while he was partridge shooting. In second growth the trees are apt to have a pretty straight grain. The trees were just right as to size. As a result a camp was completed in the center of the finest of the second growth on May 25, and a gang of men put to work. Twenty-five thousand cords of wood are to be taken out "as a starter." Everything goes—birch, beech or spruce, hemlock or balsam. A gasoline engine is being put up right in the edge of the woods to split the blocks. Should it

blow up there would be a pretty mess, and if the weather is dry enough there would be another burning.

The whole western border of the Adirondacks is a mass of woods, with dead, dry underbrush. The underbrush is being added to along every stream which will float a log. Of the streams, Black River is most important. On it there are several saw mills and pulp and paper mills. The largest pulp mill in the world is to be erected on it, it is said, very soon. Moose River and Little Black Creek, both of which reach into Herkimer county, are tributaries. The woods counties affected by the pulp industry are Hamilton, Lewis, Herkimer and St. Lawrence. The parts of the woods which the rivers do not reach are cut by railroads. The railroads carry everything—hard and soft wood both. The spectacle of the wealthiest State in the Union allowing a few companies to clear away the forest which covers the sources of most of the State's rivers is one to think about. After the timber is all gone the land will, of course, be sold to the State at about six times its original cost.

I have heard that there are preserves in the woods from which the timber is not taken in up-to-date scientific style. These preserves offer shelter to the game which still remains. Where only real sportsmen hunt over them, the overflow of animals from the preserves will supply adjoining territory. Consequently, when the State does as it ought to and buys up the land in that region, and properly patrols it with gamekeepers—makes a State club of it—the game will increase everywhere. The deer will become especially numerous. But if certain styles of clubs prevail, then there will be trouble for everything from the chipmunks to the hunters.

The efforts made to protect the game are interesting. Deer are around Northwood every summer. They are seen in the pastures, in the little wood lots near by, and berry pickers scare them out of the bushes. Partridges flock in every woods patch, and every man and boy has a gun, some two or three. All sorts of woods stories are heard there. The residents are all woodsmen. The terror of the game law is on no one. So far as I know there hasn't been a prosecution for violating the game law at Northwood in ten years, and I have been in constant touch with the woodsmen all that time. The other day, when I was in Northwood, a man told me that he had heard of twenty-two deer being killed by crusters last winter. One party on two trips killed thirteen. There ought to be lots more deer in the neighborhood. There is no better region for wintering deer than that from the Twin Lakes to the South Branch of Little Black Creek. The deer are there every winter. Before spring they are dead—their throats cut or their heads chopped off. One wants deer meat. But he wouldn't go if his neighbor wouldn't. The neighbor will go anyhow. So both go together.

At Wilmurt, ten miles away, there were, I believe, five men fined \$100 each for hounding deer. Around Wilmurt the deer are not plentiful enough to still-hunt. Twelve miles north and beyond is good still-hunting ground. The Adirondack League owns a lot of land up there somewhere, and claims the right to stop people from going up the Creek to the hunting grounds. The League is believed to be back of the prosecution of the hounders.

The trail up the West Canada is forty years old. The law says (laws of 1890, Chapter 568, Section 100) that twenty years' travel makes a trail a public highway. Apparently the League don't think all laws are equally important. The woodsmen don't pretend to be lawyers. They are afraid of the League's power. One can talk morality to them by the rod, and they look sullen and go crusting and talk about a dry spell and what wonders a single match will do.

The woodsmen believe the game is to be preserved. They see that men have been fined, and that it is dangerous to let dogs run free. But they persist in calling it "Canachagala cold storage preservation." A friend of mine, Byron E. Cool, at North Lake, was at Canachagala Lake early last summer. When he came back he wrote a story of the trip for the Boonville Herald. He told of finding three deer sunk with rocks to the bottom of the lake on the floating ground. He added that "everybody knows none but League members or guests are allowed to hunt on Canachagala Lake." It stirred the woodsmen quite a good deal. Canachagala Lake is a State reservoir, a feeder of the Black River and Erie canals, but the League claims it. One's sympathies can't always run to upholding game laws.

As the editor sees, I spent most of my time gadding around. I did catch a few fish, but mostly I was seeing the woods and talking to my friends.

The season was very late, but now is in full speed. The leaves are fully out, and fishing worth having begun.

Mr. Haskins and Did Thomas were at Will Light's. They were fishing every day and all day long. Haskins has been coming to the West Canada for thirty-four years. He stays a month or two each year, and sees the finish of many a big trout every year. He and Did are inseparable. Each one says that the other never says things except when a rock rolls from under his feet and causes him to settle down waist, breast and whisker deep in the water. Then even the bubbles coming up are full of sound. They were the first men I ever saw who could cast a fly and make it settle on the water like a cherry blossom. When I used to say "fish pole," Mr. Haskins taught me better. When I insinuated, this year, that I was going to use worms as well as artificial flies, he remonstrated with me, and I used them only once. The pair got plenty of fish, as did all the fishermen who knew how to handle their rods. I saw Will Lovel land a 1½ lb. trout. It was a picnic. Will is the best fisherman in the country. He said afterward that the fish fought harder than any one he ever saw. The trout cavorted among the boulders and from the surface to the bottom, working all the while, but finally came to net still flapping.

Will Light and George Squires put 30,000 trout into the creek this spring. There ought to be better fishing in a few years, but cold bed atrocieties will have to be stopped.

If it wasn't for the men who are cutting away the forest the prospect for the future of the Adirondacks would be good. I don't blame the men who make money from their own land, but it does seem as if the State ought to see the sense of buying up the endangered territory, and all the rest, at once. RAYMOND S. SPEARS.

NEW YORK CITY.

Adirondack Rivers and Lumbermen.

From the Albany Journal, June 7.

THE decision of the Court of Appeals in what is known as the Moose River case is a very important one in the effect which it will have upon the preservation of the forests and the protection of trout in the Adirondack streams. It places the pulp manufacturers and the lumber companies at a serious disadvantage, as it declares unconstitutional every law making Adirondack streams public highways for the floating of logs.

The ground taken by the court is that these laws are not passed for the benefit of the general public, but are mere subterfuges to get around legislation so that private individuals may enjoy special rights in the use of the specified waterways. This view of the court is strictly in accordance with the facts in every case where the Legislature has passed a bill for the benefit of the lumbermen, who drive their logs through the Adirondack streams, and often kill large tracts of timber by building dams to provide sufficient water for their purpose.

This practice kills the trout, and has been so destructive, especially in the Ausable River, that once excellent fishing grounds are no longer available. Trout not killed by the logging are destroyed by the sawdust that is boldly emptied into the streams by the mills in defiance of the law.

The law just declared unconstitutional was passed in 1894 for the benefit of the lumber firm of Thomson & Co., in which Lemon Thomson, John A. Dix and Senator Curtis N. Douglas, of this city, are interested. This firm had legal trouble with W. S. DeCamps, who objected to the lumbermen going over his property. They then got the bill through the Legislature, but were enjoined, and the case was stubbornly fought until the present decision was reached.

The DeCamps brought suit for damages for crossing their land and were awarded \$1,805. The defendant lumbermen fell back upon the Legislature and got a bill passed declaring Moose River a public highway for floating logs. The DeCamps got an injunction and questioned the constitutionality of the law. The court holds that the declaring of Moose River to be a highway was not for public but for private purposes, since it was merely to assist lumber interests, and was therefore unconstitutional.

It is understood that the lumbermen have cut \$19,000,000 of lumber and that the decision prevents taking it out. Dr. Seward Webb may become involved in the matter, as the Thomson Company purchased its land from him for the purpose of taking out the timber by water.

Under the decision no logs can be floated down a stream without the consent of the owners of the riparian rights, which means that these owners can charge such tolls as they see fit for the use of the streams for the floating of logs. This will increase materially the cost of getting lumber out of the woods, and in some cases practically will put a stop to lumbering, on account of this increased cost. In the case of Thomson & Co., the firm can get its logs out by rail from its lumber tract to its mills at McKeever on the Adirondack & St. Lawrence Railroad, by hauling the logs a short distance.

The pulp mill men claim that it is unwise for the State to ignore such large business interests simply to benefit a few sportsmen; that the value of all the trout in the Adirondack streams is infinitesimal in comparison with the value of the pulp mill interest. This State's pulp industry is three times as large as that of any other State in the country. There are ninety mills, representing an investment of over \$25,000,000, and a very large number of men are dependent upon pulp manufacture for a livelihood. The claim that they were denuding the watersheds of the rivers that take their rise in the Adirondacks the pulp men deny, and say that they are exercising great care in the cutting of trees for the protecting of their future supply.

This claim is not admitted by those who have been working to secure better protection for the Adirondack forests.

Fall of the Giants.

WHAT is believed to be the finest lot of walnut timber in the United States is now being cut out on the woodlands in the heart of the Miami Indian Reserve, in the southern part of Wabash county, Ind. On these seventy-five acres of land are sixty-five massive walnuts, none of which is less than 4 ft. in diameter, and ranging up to 9 ft. 6 in.

The monarch of the lot is perfectly straight. Its trunk is not broken by a limb for 66 ft. One of its forks was 33 ft. long and 3 ft. through. Two trees, standing together, denominated "the twins," are each 5 ft. through and 6 ft. to the first branches. At one place eighteen walnut trees from 2 to 3 ft. in diameter had to be felled in order that a 7 ft. tree, around which they were thickly clustered, might be felled without splitting its trunk.

Besides the splendid walnut, there are mammoth oaks from 6 to 8 ft. in diameter, without limbs for a distance of from 60 to 70 ft., and there are shellbark hickories from 3 to 4 ft. through, with no branches up to 75 ft.

The "Jerusalem Cricket."

PHILADELPHIA, Pa., June 6.—*Editor Forest and Stream:* In the issue of FOREST AND STREAM, May 20, page 385, Mr. E. Hough gives a rather good description of the well-known Western sand cricket. It is a common insect in many localities, and was first described by Dr. Cyrus Thomas in "Hayden's Geological Surveys," 1871. Its scientific name is *Stenopelmatus fasciatus*. As Professors Comstock and Smith in their works on insects have already given it the common name of sand cricket, this name must stand, while Mr. Hough's inappropriate name "Jerusalem cricket," must be rejected.

C. FEW SEISS.

Take inventory of the good things in this issue of Forest and Stream. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Natural History.

The Winter of 1898-9.

THE winter of 1898-9 was memorable to people in general throughout most portions of the United States, but there are two classes in particular who will not forget, for it left a rich legacy of disappointment and grief, equally sure in both cases, though the bird lover's portion is not like the fruit-grower's—susceptible of tabulation. However, an approximate figure could be reached if those who can would supply data, and it becomes their duty to do so, in order that greater vigilance along protective lines should be manifest to all who would keep the world beautiful.

While the conditions in Arkansas were peculiarly trying for man, all through the season, too frequent rains being succeeded by severe winter weather, the birds had no grounds for complaint before the last days of January, but from that time until well past the middle of February, how to preserve life was a problem too involved to be happily solved save by the most hardy species.

During this period thermometers registered 12 below zero, and the ground was frozen something over 13 in. below the surface. A snowstorm the 29th was disastrous enough, but when it was followed by one which covered trees, shrubs and ground with an impenetrable coating of ice times were indeed perilous for all birds, whether residents or transients.

My experiences at so stressful an epoch may not have been phenomenal, but they are at least too interesting to remain all my own if a lame description can make them the property of others. They began with the snowstorm referred to, as robins wintering in the surrounding country came flocking about the city to be slaughtered by thousands before hunters could be made to understand they were protected by the song bird law, passed two years ago.

Sitting the first bitter cold night, grieving over this massacre of the innocents and the alarming situation of those still left, an imperative tapping was heard at a glass door, from which the light from within sent welcoming beams, and upon opening it in fluttered a half-frozen robin.

Showered with love phrases and tempted with the choicest of food, he yet remained so unappreciative of both that at last, understanding his mission as one of solicitation, we gave him his freedom, and from that moment until the sun had unlocked nature's stores we supplied all birds that would come, with abundance to eat.

At the end of the garden, away from the house, wheat and corn were put out many times a day, while the ground under a south window—called "the head of the board"—was liberally sprinkled with rice, cracked pecans and bird seed. It would be impossible to say how many were thus cared for, but that does not matter, since the interest lies in the species represented more than in numbers.

A few cardinal grosbeaks and brilliantly beautiful blue-jays made spots of vivid color now and then in the somber landscape, selecting with great care uncracked corn for the foot of the table, while a half-dozen fox sparrows never ate below the salt or accepted less than the best.

Juncos came to feed upon seeds for the most part, but only when things were at the worst, and even then seemed often on the point of bursting into song, although never getting beyond a cheery clearing of the throat.

White-throat sparrows were by far the most numerous and faithful of our guests, with here and there one who sang over and over a refrain as exasperatingly incomplete as the one Sandy Faulkner finally finished for his world-famous entertainer.

The white crowns, unlike their cousins, had only two or three representatives, and these refused us so much as a broken measure of their cunning little polka-time song, but we forgave, for it is an event even to see them in this region.

At different times hairy and red-bellied woodpeckers were seen trying to peck through the ice on the trunks of the trees, but the attempt was as fruitless as that of a poor mourning dove to warm her pink feet on the frozen ground, as she pecked daintily at the food spread before her.

One morning a queer song came from the top of a little arbor, and there sat a shrike greedily eyeing a group of small birds; but, like the hawk, which had hung suspended a few moments before over the same spot, he did nothing but look.

A small party of meadowlarks stopped for a few grains of wheat, but they must have known of stores more to their liking, for they remained only a short time, and made but the one visit. Of grackles there were never more than five, and these were as quiet as the most reticent of their kind, save once or twice, when a wandering sunbeam was answered by a cherry scrape of their fiddles.

Many times during the most severe weather a few of the most forlorn looking robins it was ever my fortune to see would come to the garden and sit perfectly still for moments, making no attempt to eat grain or seeds. This troubled me greatly, even when I knew they were cloyed by feasting on the berries still hanging on the China trees. For they would eat until stupid and drop upon the ground an easy prey to any one who chose to pick them up, or to the cold, which was intense when night fell. That many lost their lives in these ways is certain, though of the actual number no one can even guess.

Now, while the pleasure of providing for these birds was unspeakable, and all were held in high esteem, there were about two dozen purple finches who made the week of their stay such a continuous delight that it went far toward giving them first place in our favor. At first, when not hanging head down from the little fuzzy sycamore balls, they would eat on the ground with the others, but very soon a crowd of them would drop like so many leaves upon the window sill almost before the sash could be lowered after scattering their rations.

Encouraged by such boldness, we began holding the nuts in our hands and were amazed to find the little creatures would sit upon them as trustingly as though reared in the house. This was followed in a day by their flying in through the open window to the table, where plates of cracked nuts were kept, and at last by alighting upon us, clamoring in the prettiest way for more food, whenever we appeared outside near this window.

It could not be called ingratitude—rather commendable independence—when their whole conduct changed with the rising temperature, but it was a little mortifying to find even "one-eyed Dick," an especial pet, as shy as the wildest of birds on his last visit.

The crowds of white-throat sparrows and all other species had gone a few days earlier, some to the vine-covered trees and shrubs in the ravines, which are winter quarters for many residents as well as winter sojourners, and others, another stage on their journey toward summer nesting grounds. Before their departure, however, as I was anxious to learn what the casualties had been, people were asked to say what dead birds they had found, and although their record is not clear as to kind or precise as to numbers, it will be noticed that it contains only the most hardy species. This is a pertinent fact of itself, but taken in connection with those drawn from my observation during the spring migration, it forms a secure basis for the proposition at the beginning of this article, unless—as is not at all probable—the conditions here were and are still exceptional.

Dead Birds.

Twenty people found from one to three dead robins, some very poor, others plump and uninjured. Two citizens gathered "a half-bushel" of robins from under China and evergreen trees.

A countryman gave this account: "Lots of dead birds, redbirds, robins, woodpeckers, flickers, mockers and some little sparrow birds. These last died on their nests."

On a sandbar in the river the bodies of meadowlarks, robins, yellow-hammers and numbers of small birds were found, while people in the city added to that list jays and purple grackles. As in 1895, great numbers were found crowded together in the hollow trees in the woods, but the witnesses could not specify what kinds were there.

A few myrtle warblers were found, and alas! several bluebirds. These beautiful creatures were only just beginning to be seen here again after the terrible experience in 1895, and now not a note has been heard from them all through the spring.

The non-appearance of some regular transient visitors doubtless has nothing whatever to do with the severe cold of the winter, but the diminution in number of certain other transients and residents unquestionably does. At any rate the names of those less abundant, or missed altogether, make a formidable list.

Bluebirds.—Not seen, although fairly plentiful during fall migration, and a few groups about just before the cold weather set in.

Myrtle Warblers.—Not seen, although the most regular of all the small birds, at least, to appear in the spring.

No Wilson's, magnolia or cerulean warblers have been seen, but they are not regular in their appearance.

No Louisiana water thrushes at their former nesting grounds, though one single transient passed on quite early in the season.

Mockingbirds, redstarts, Maryland yellow-throats, cardinals, purple martins, orioles, chipping sparrows, hooded and parula warblers notably less, and wood peewees, great-crested fly-catchers considerably reduced.

MRS. LOUISE MCG. STEPHENSON.

HELENA, Arkansas.

The Danger of Introducing Noxious Animals and Birds.

BY T. S. PALMER, ASSISTANT CHIEF OF BIOLOGICAL SURVEY.

From the Yearbook of the Department of Agriculture.

(Continued from page 444.)

Need of Legislation.

The examples already cited show the danger of introducing exotic species on large islands, particularly on those far distant from continents, where the fauna is necessarily limited and predatory species practically absent. In such places introduced species are almost sure to increase very rapidly. The experience of New Zealand indicates the necessity of exercising unusual care in introducing birds and mammals into the islands recently acquired by the United States. Much remains to be learned about the fauna of these new possessions. Puerto Rico is less known than any of the larger islands of the West Indies, but it probably has no indigenous mammals except bats. About 150 species of birds have been recorded from the island,¹¹ of which twenty are not found elsewhere. The fauna of the Hawaiian Islands is still more limited; indigenous mammals, except one bat (*Lasius*), are entirely wanting, but many of the birds are of great interest. Although no complete list of them has yet been published, about 100 species are known to occur on the islands. The fauna of the Philippines is much richer. The mammals are comparatively unknown, and until recently were supposed to be poorly represented, but at present the list includes some fifty species, of which about half are bats. The birds have received much more attention, and nearly 600 species have been recorded from the archipelago,¹² 286 occurring on Luzon alone.

All of the islands have probably suffered more or less from the introduction of noxious species, especially rats and mice. In Hawaii rats have done so much damage that the sugar planters have imported the mongoose to destroy them, and this animal is now becoming a pest. The mink of India is also present in considerable numbers, and the house finch (*Carpodacus mexicanus* from-

¹¹ Gundlach, J. F. O., XXVI., 1879, p. 163.

¹² This number includes the species found on Palawan. Worcester and Burns class Palawan with Borneo on zoological grounds, giving for the Philippines proper 526 species; of these, 323 are confined to the group. (Proc. U. S. Nat. Museum, XX., 1898, pp. 564, 575.)

talus) has been introduced, notwithstanding the fact that it is usually considered a great pest by fruit growers in California.

During the last fifty years a number of acclimatization societies have been organized for the purpose of introducing animals and plants from foreign countries. Private individuals, too, have devoted both time and money to importing birds or mammals which they consider necessary or desirable additions to the native fauna. Four or five societies exist in New Zealand, and several have been formed in the United States. During the years 1872-1874 the Acclimatization Society of Cincinnati, O., expended \$9,000 in the purchase and importation of European birds, and introduced some 4,000, belonging to about twenty species, at an average cost of about \$4.50 a pair. These included several birds of doubtful value, such as the starling, skylark, and great titmouse or kohlmeise.¹³ This experiment proved a failure.

In 1888 the Society for the Introduction of European Song Birds was organized at Portland, Oregon, and imported two lots of birds in 1889 and 1892, at a cost of about \$2,000. Among the numbers were fifty pairs of skylarks, thirty-five pairs of black thrushes, thirty-five pairs of starlings, fifteen pairs of green linnets, and a number of others, representing in all some twenty species. Recently the introduction of the kohlmeise into the Northwest has been seriously considered, and the spasmodic attempts to acclimatize the skylark and starling have been renewed.

Whatever may be the difference of opinion concerning the desirability of introducing exotic species, it will be generally admitted that some restriction should be placed on the importation of birds and mammals which may become injurious. Since it has been found necessary to restrict immigration and to have laws preventing the introduction of diseases dangerous to man or domesticated animals, is it not also important to prevent the introduction of any species which may cause incalculable harm. Experience with the English sparrow, the work of rabbits in Australia and of the mongoose in Jamaica, all these have abundantly shown the necessity of preventing the repetition of similar costly blunders in the future.

Twelve years ago Dr. C. Hart Merriam, Chief of the Biological Survey, urged the necessity of restricting the importation of exotic species, as follows:¹⁴

"It seems desirable that a law be enacted conferring upon the Commissioner (Secretary) of Agriculture the power of granting or withholding permits for the importation of birds and mammals, except in the case of domesticated species, certain song and cage birds (to be specifically enumerated), and species intended for exhibition in zoological gardens, menageries and museums, which may be brought in without special permits. The question of the desirability of importing species of known beneficial qualities in other lands is one which sooner or later must force itself upon our notice; and it is highly important that when such experiments are made they should be conducted by or under the control of the Department of Agriculture."

Ten years later Mr. Alexander Craw, quarantine officer of the California State Board of Horticulture, again called attention to the need of legislation, and in his annual report of 1896 recommended the passage by Congress of a stringent law preventing the introduction of noxious animals.

At present there is no Federal statute on the subject, and apparently California is the only State which has given the matter serious attention or has taken steps to prevent thoughtless or intentional importation of injurious species. In the act creating the State Board of Horticulture, approved March 13, 1883, and amended March 8, 1889, authority was conferred on the board to make regulations for the purpose of preventing the spread of fruit pests. In accordance with this act, certain quarantine regulations were adopted on Aug. 15, 1894, one of which, Rule XII., provides that "animals known as flying fox, Australian or English wild rabbit, or other animals or birds detrimental to fruit or fruit trees, plants, etc., are prohibited from being brought or landed in this State, and if brought, they shall be destroyed."¹⁵ This law has resulted in the destruction of several flying foxes, and, so far as known, every mongoose thus far brought to the port of San Francisco. It is, perhaps, not too much to say that to this regulation and to the vigilance of the quarantine officer at San Francisco the State owes its present freedom from the mongoose.

The action of Cape Colony and Western Australia on this question stands out in marked contrast to the apathy of other countries. Cape Colony, in 1890, made it unlawful to introduce rabbits, either by land or sea, or to turn them loose within the colony;¹⁶ required the rabbits already in the colony to be confined in hutches or boxes constructed according to certain prescribed regulations, and authorized anyone to destroy rabbits found on his premises, Crown lands, or along public roads. Western Australia, profiting by the experience of her sister colonies on the eastern side of the continent, has taken measures to secure protection from the evils of indiscriminate and ill-advised acclimatization by the passage of the so-called "Destructive birds and animals act" (57 Vic., No. 22). This law, passed in 1893, prohibits the introduction of all birds or animals which, in the opinion of the governor-in-council, are destructive to vineyards, orchards, fruit trees, or any agricultural produce. The act prohibits the keeping of such birds or animals on private premises, authorizes the destruction of those already in the colony, prohibits the liberation of any destructive bird or animal, and permits duly authorized officers to enter premises for the purpose of seizing or destroying such birds or animals. The term "destructive" is interpreted to mean any species to which the governor-in-council may from time to time extend the provisions of the act by proclamation, and the selection of species is based mainly upon the recommendations of the bureau of agriculture.¹⁷ The law is therefore elastic and may be easily modified when necessary. Sparrows and rabbits were originally included in 1893, flying foxes were added in December, 1895, and starlings, blackbirds, and thrushes in January, 1896.

Summary.

(1) Acclimatization of plants differs from that of animals since plants are introduced for cultivation and thus kept to a certain extent within control, while animals are liberated and controlled only by natural enemies or unfavorable conditions.

(2) Animals and birds are distributed from one continent to another, and to islands, either by accidental means or by the direct agency of man. Most animals are intentionally introduced into new regions, cases of accidental dispersion being comparatively rare except among rats and mice.

(3) Domesticated animals, like plants, may run wild and become injurious, especially in regions where food is abundant and natural enemies are absent. Goats and cats on isolated islands are well-known examples.

(4) The animals and birds which have thus far proved most injurious are the rabbit, mongoose, stoat, weasel, flying fox, English sparrow, starling and mina. The skylark, green linnet, black thrush, and great titmouse, or kohlmeise, are of doubtful value and likely to prove injurious. These species are all natives of the Old World, and with the exception of the mongoose, mina and flying foxes, are inhabitants of the temperate regions of Europe and western Asia.

(5) Notwithstanding the object lessons afforded by the English sparrow in our own country, the rabbit in Australia, and the mongoose in Jamaica, no steps have been taken to prevent the repetition of similar costly mistakes in the future, and at present no restriction is placed on the indiscriminate importation of exotic species into the United States.

(6) Recent events have given new importance to this subject. The gradual increase of the starling and the efforts to introduce the kohlmeise require prompt measures to prevent species of such doubtful value from gaining a foothold in this country. The acquisition of new territory has also brought us face to face with new problems. Not only should the mongoose be prevented from reaching the United States from Hawaii and Puerto Rico, but the native fauna of these islands should be preserved and all our island possessions protected from ill-advised acclimatization, which has caused so much loss in Australia and New Zealand.

(7) The introduction of exotic birds and mammals should be restricted by law and should be under the control of the United States Department of Agriculture. Western Australia has already adopted this course, and under the "Destructive birds and animals act" of 1893, prohibits the importation, liberation, or keeping of animals and birds which the colonial bureau of agriculture considers injurious to vineyards, orchards, or crops.

Game Bag and Gun.

The Wyoming Game Situation.

JACKSON, Wyo., May 31.—*Editor Forest and Stream:* The letter of friend Wells, in a late number of FOREST AND STREAM, relating to the Indians hunting and the possible trouble with them in the game country this spring sounds a note of warning to the people of the outlying districts that it is intended that trouble shall result from any infraction of the law by the Indians off their reservations.

To one familiar with game conditions in this country it seems somewhat strange that any class of people are denied the right to hunt and kill to their hearts' content, that the Indians, the original holders of inalienable rights, should be disturbed in their enjoyment, when from every nook and corner of this country comes the startling intelligence that the game laws now in force are being daily violated.

It is a well-known fact that in the Jackson Valley country two-thirds of the settlers have violated in some way the game and fish law of the State since its enactment by the Legislature, that at the same moment these same people are ready to go forward and fight Indians, for the same offenses they have themselves committed.

In and around Jackson and Elk, Wyo., and in the outlying districts of the community, numerous persons engaged in the killing of elk for bear bait have in no way been interfered with; while on the other hand, persons not exactly standing in with the combination have been threatened with summary punishment if they so much as looked at a piece of meat. Is this consistent?

Yesterday, at Jackson, in the county of Uinta, in the State of Wyoming, S. L. Adams sold fifty pairs of bull-elk teeth. Adams is a trapper by instinct and occupation. He is also a member of considerable influence in the Jackson Hole Gun Club, an organization at one time, it is said, potent in the protection of game in the Jackson Valley country. Adams' partner, H. F. Davis, although not a trapper in that sense of the word, is a member of the same organization. When it is understood that no elk, especially bulls, have died in the entire county in the last two years, it seems conclusive that something is wrong and radically so. It is the passing of the elk into the hands of the persons who engage in hand to kill and destroy for pecuniary benefit and advantage. No evidence can remove the belief that the greater portion of this game was killed expressly to obtain for sale these fifty pairs of elk teeth. The evidence in my possession, taken verbatim from reliable parties, is conclusive as to facts.

When it is taken into consideration that on the Green River, and adjacent country, great corporations engaged in the logging business have numbers of employees and hunters engaged in killing elk to feed them, as is reported, and which personally I know to be true, then again it is evidence that there is dereliction upon the part of the officers appointed to protect the game.

I do not believe in the sincerity of the officers to enforce the game law in Uinta county, Wyo., for the following reasons:

First. The parties in charge of the game protection in the Jackson Valley country are a small majority in favor of the annexation of the Teton Timber Reserve to the National Park.

Second. That if it can be reported and shown that the people will not respect the law, some Federal action will be taken to make the annexation.

Third. That to enforce the law against residents will

not coincide with political promises made, and as yet unfulfilled.

It is appreciated upon the part of the writer that the officers of the law and some other individuals will come to the defense of themselves, and thus it will be in the province of this writer to go into details, and make some of the exposures, backed by the evidence, to meet the requirements of the cases in view.

Public opinion is in favor of a strict enforcement of the law in the Jackson Valley country, and when no discrimination is made as to person, then that law can be enforced and the officers will hereafter be unable to hold individuals responsible for placing alleged stumbling blocks in their way.

In the Adams-Davis elk teeth cases, evidence can be had, upon inquiry. R. M. W.

In the Mud.

NORTH JUDSON, Ind., June 8.—*Editor Forest and Stream:* A new neck of the woods this time. Right down among the Kankakee swamps that you have heard about, and perhaps been in and were glad to get out of again. I never was in them to hunt or camp, or play golf, but there are a lot of as fine fellows here as you ever saw who get to go and shoot a few ducks and other game there each fall or spring. I am told that there are some who went hunting in the swamps and did not return, and more than one faithful dog has sunk in the treacherous sand and mud peculiar to this swamp. One man who told me of his experience knows what it is to get into it, and it might be worth repeating.

"I had my dog, Don, with me," he said, "and we were out in the high grass watching some fine ducks that were swimming along just out of range, and after lying there for an hour we both started to crawl up to them. But in order to do this it was necessary to make a wide circle behind some clumps of grass, and in passing across some soft ground a lot of shells fell from my pocket, and in gathering them up I got the mud worked up, and when I tried to go on, found I was fast. The dog knew something was wrong and began to jump around near me, making it worse. I tried to make him be still, but my scolding only made him worse. After a few minutes of the hardest kind of work, by which I was nearly exhausted, I found I was in a pretty bad fix, and didn't know how I was going to get out of it. I looked at my gun, and seeing it just being covered with the mud, I thought it would be a very tough thing for me to have to go down into it the same way and be suffocated by inches. Then I grasped the gun in both hands and slammed it in the mud as deep as I could and pulled myself out a few inches, then repeated the operation till I was out of the mud and on to some grass that held the mud together solid enough for me to rest on. The dog came up to me and acted like he was mad. He just 'caved' around, barked, licked my feet and hands, lay down, rolled over, and tried to show in every way possible that he knew I was out of the danger that threatened me a most horrible death. We got up after a half-hour's rest, and wasted no time looking for ducks, but went home as fast as we could. I have hunted in the swamps for ten years, and have laughed at the stories of men getting caught in them, but when I see a lot of sportsmen going there to hunt I always feel it my duty to tell them the story of my narrow escape, and caution them to be careful. I get laughed at, seldom thanked, and sometimes told to mind my own business, but I feel it my duty, and I always try to do it."

Such is the story of a man who loves the rod and gun and won't shoot a bird on the ground, nor one out of season.

There are a fine lot of quail here; I hear them every evening as I am at my work. There are some snipe, and in the woods a few miles away are squirrels. Bass Lake, ten miles east, has good fishing, boating and camping. English Lake, four miles—everybody knows that place. Pretty good place for a sportsman to come to in any season of the year that game or fish may be taken. There are three railroads here—the P., C. & St. L., Erie and I., I. & I. All lead to and from some of the finest forest and stream sport to be had in the State. J. B. H.

The Yellowstone Park.

MAMMOTH HOT SPRINGS, Wyo., June 8.—*Editor Forest and Stream:* I said in my last letter that spring was here. I thought I was sure of it, but those coming here lately think I am wrong. Monday the troop of cavalry that is to take the place of those about to start for San Francisco arrived in a snowstorm. Tuesday morning the whole Park was white with new snow. We had had before this a few warm days that raised most of the streams, leading us to think that spring and the season of high water had come; but the change to cold weather and frost checked the melting snow until the streams are as low as usual. Now the Yellowstone and Madison are running quite clear.

Crews with teams have been out, and by shoveling snow have gotten through to the Grand Cañon. Upper Geyser Basin and Yellowstone Lake. Soldiers from M Troop are being sent out to relieve those at winter stations. The men from these stations and all the two troops of the Fourth Cavalry now here will be on their road to San Francisco by July 1. It will be a great change for them to be sent to Manila from the land of ice and snow.

On the morning of the 7th inst. a calf elk was born at the Mammoth Hot Springs; the mother was one of the cows captured last winter. The five bulls are looking rather ragged, as they have just commenced to shed their long hair. Their horns are growing nicely, giving promise of fine sets of antlers. They are now from 15 to 18 in. long. When I saw them last they were lying down in a bunch, as close together as possible. They are friendly and kind enough to each other now that their horns are in velvet. Riding over Mt. Everts yesterday, horsemen looking for stock saw over fifty elk calves. Antelope are having their young, and mule deer will again soon.

During the past winter—1898-9—155 in. of snow fell at Mammoth Hot Springs. That is not counting any that fell in June of this year.

This spring is something like that of 1880, when we did not have high water until in July, when the Yellowstone

Lake was half-covered with ice on June 21. Three parties of trappers had been trying to get to the lake for a month. The first to reach the lake were my cousin and myself; we reached there over the snow on July 7, and at the same time the first elk came through from their winter range. I don't think this will be as late a season as that. Even now, if the roads had not been cut out wide through the timber so that the wind and sun should get at the snow, it would have been almost impossible to have gotten teams through to the cañon and lake.

The hotels will not be open until the 15th of this month—early enough, and too early for many not used to a cold country.

The roads where the snow is off are being put in good condition for the summer travel. As scouting parties get about, the loss of game last winter by starvation becomes better known, and I'm sorry to say most of the loss appears to be among the young animals. E. HOFER.

Albert G. Mann.

PROMINENT in the necrological list of sportsmen for the year 1899 will be the name of Albert G. Mann, of Worcester, Mass.

More than seventy-one years had been counted upon his rosary of life before he answered the final summons at his extensive and refined home in this city in the early morning hours of June 9.

He was born upon a farm in Orford, N. H., July 19, 1827, where he passed his childhood and youth until eighteen years old, when he came to Worcester, where he ever after made his home. He entered with enthusiasm upon his life work of quarryman, stone-cutter and contractor, and by good judgment, enterprise and unquestioned integrity he achieved distinguished business and financial success.

But it is of Mr. Mann as a shinnig light in the guild of sportsmen that I would say a word of appreciation and praise. Born in the early days of our country his early education was but of the most rudimentary character, but being studious and observing, and possessed of a very receptive mind and retentive memory, he became a lifelong student and attained to great proficiency in many things besides those pertaining more directly to his business.

He was an authority on explosives, their constituent elements and their varied combinations for different purposes and how to use them most effectually. This led him naturally to the question of gunnery—the proper proportion and weight of different calibers of rifles—the proper shape, size, weight and density of bullets for different charges and different kinds of powder, the many and difficult problems in the science of ballistics, which he mastered and gave the results to the world in the columns of various publications.

In the days of long range rifle shooting, a generation of years ago, he was a frequent visitor at the butts, and his uniformly steady shooting and good scores gave him high place in the ranks of the best rifle shooters of our country. His favorite rifles for sporting as well as for target practice were double-barreled, and were made for him according to his own plans and specifications by the celebrated British rifle maker, Alexander Henry.

He had hunted all the large game in all parts of this country, having camped and hunted from the wilderness of Maine in the East to the Rocky Mountains in the West. It was but a few short years ago that he killed his last moose at Reed's Machias Lake Camp in northern Aroostook county, Maine, where he was planning to go again the coming season.

He was a man who enjoyed his own society, a man who loved the solitudes for their quiet, healthful, restful pleasure; he loved nature for her variety and beauty; he loved the companionship of the judicious and thoughtful; he courted not the society of the game hog or gambler at the traps. He lived a useful life and died lamented. The world is the better for his having lived therein, and it is a sad satisfaction for an old friend of many years to lay this humble tribute upon his new-made grave.

GEO. McALEER.

Game Protection Past and Present.

Editor Forest and Stream:

As the readers of FOREST AND STREAM would be apt to derive some very erroneous conclusions from the article entitled, "Exterminatory Peregrinations," and signed Didymus, in your last issue, I beg to reply to the same.

In the first place, the writer fails to state that the books from which he quotes were written by Coquina many years ago when both the conditions and the sentiment regarding the killing of game were entirely different from those obtaining to-day. From the article referred to one might infer that the things Didymus reports occurred last year instead of twenty years ago, and this manifest unfairness leads me to think that Didymus has some ulterior motive in his attack on Mr. Shields. It is easy to take isolated sentences from the several books he has written and make out a plausible case against Mr. Shields; but when it is remembered that he made trips through the South and West years ago in the interest of sportsmen's papers and collectors of specimens, and that many of the birds and animals he shot were mounted and placed in various museums, it puts a different complexion on the experiences he chronicles. Then, too, in quoting the total catch of fish or the amount of game killed, it might be proper for Didymus to have learned how much of the total should be charged up to Mr. Shields. Moreover, if hounding deer and spearing fish and killing 'possums, and even shooting alligators were at that time illegitimate features of sport, I fear many of the readers of FOREST AND STREAM must also count themselves guilty.

I have no doubt—in fact I know—that, if given the opportunity now, Mr. Shields would shoot very little game, for he has been for several years a most ardent advocate of game protection and reasonable bags. It is said that the difference between a man and a mule is that the man can change his mind but the mule can't, and if years ago, when the game supply seemed inexhaustible, Mr. Shields killed more than his share because of his opportunities and skill, that is not a reason for robbing him of the credit due him for the work he has done and is now doing on the other side of the proposition. "Remem-

ber not against me the sins of my youth," said King David; and so say most of us who have long hunted and fished.

I believe there is no man in New York to-day who spends more time and thought, and money, too, in the interest of game protection than George O. Shields, and most of the enemies he has made are those whom he has correctly branded as game hogs. Whether Didymus is one of these, I know not, but it is evident that he has some time stacked up against him, directly or indirectly, and gotten the worst of it.

Didymus is correct in saying that Mr. Shields is the president of the League of American Sportsmen, and those who have worked with him since the organization of the League know full well the amount of arduous, effective and unrequited work he has done in that connection. I know whereof I speak, and if Didymus, or any other man hiding under a *nom de plume*, will take the trouble to learn and state the facts, he will discover in Mr. Shields a man who is giving a considerable portion of his time and substance in the effort to bring about the state of affairs which Didymus professes to desire.

"There is no defense against reproach but obscurity," and as Mr. Shields has come out into the open in respect to game protection and game hogs, it is to be expected that he will be subject to attack, even if his enemies have to go back a score of years to dig up an excuse for making it.

ARTHUR F. RICE.

PASSAIC, N. J., June 11.

New Brunswick Notes.

PRESENT indications point to a somewhat larger influx of sportsmen next fall than in any previous season. There is reason to believe that our American friends will meet with good success, for all reports agree as to moose and caribou being very plentiful. In many localities, especially on the South West Miramichi, the moose yarded in large numbers within a few miles of the settlements, where they had never been known to take up their winter quarters before. It is estimated that in the Cains River region alone several hundred caribou spent the winter, the herds starting north in May in excellent condition. The killing of big game in the deep snow, though not entirely stamped out, was very much less extensive last winter than formerly.

The well-known Scotch Lake guide, Adam Moore, writes to a friend here that on a certain evening lately there were visible on one of the Tobique lakes from his camp at one time eight moose and two deer. The next morning he visited another lake, where four moose and three caribou showed up. Adam has been trapping bears this spring, and though this is his first season at the business, has secured up to date fourteen specimens.

Some American sportsmen appear to be under the impression that the New Brunswick game laws have been amended by the Legislature. Practically no change has been made. A bill embodying some important changes, such as abolishing the \$100 bond provision, shortening the open season, prohibiting the sale of partridge, etc., was prepared by the Surveyor-General, and submitted to the House, but was, for reasons unexplained, allowed to lapse until the dying hours of the session. It was then adopted *en bloc*, subject to being brought in force by proclamation of the Lieutenant-Governor-in-Council. Premier Emmerson is my authority for the statement that it will not be proclaimed this year, so the law stands just where it did last season. Some of the changes in the new bill were very desirable, and it is, to say the least, regrettable that so important a subject as the game laws of the Province should not have been given adequate attention. So far as I can gather, the discourteous treatment received by the new bill was due to two causes: First, the Government had never, as a body, considered the bill, and were not a unit as to all its provisions; second, it was in the codified form used in the Ontario act and elsewhere, and the different sections required more time and attention than the members of the House, at the close of the session, felt like giving to the subject. Had the old law been retained, subject only to a few important amendments, which it was admitted by all were needed, there is no doubt that these latter would have readily passed the House.

The Canadian Pacific Railway authorities have been bringing pressure to bear at Ottawa to induce the Dominion Government to allow all game carcasses or trophies legally killed by sportsmen to be exported when accompanied by the owners. My information is that this very desirable concession has been secured, and will take effect this season.

FRANK H. RISTEEN.

FREDERICTON, June 8.

Partridges Near Ticonderoga.

NEW YORK, June 9.—*Editor Forest and Stream:* While the farmer is praying for the much needed fall of rain to start his spring crops, the optimistic sportsman almost sees the hand of Providence in this very dry spell. Up in Ticonderoga, where there has hardly been a drop of rain in six weeks, I am told on good authority that there were never seen larger broods of partridges than this spring. The little fellows generally begin to run around for forage about Decoration Day, and as the weather has been warm, not to say hot, since then, with no heavy dews and no showers, the danger of the usual cold week or fortnight in June is over, as far as that part of the hunting grounds is concerned. I have often seen the woods alive with the chicks along Buck Mountain about the last of May, but after the long cold rains but few could be found with the old birds. Last season, however, there was little shooting, as the birds were very wild. There were lots of them and they wintered well, notwithstanding the cold, which offered no special hardships to our little dreadsnaughts, secure in their warm hollows thickly grown with pines and hemlocks. As a result, there will be first-rate shooting at the Vineyard Farm, and we shall be glad to see any gentle sportsmen who may want a turn at the grouse, grays and woodcock.

PETER FLINT.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Massachusetts Game.

DANVERS, Mass., June 8.—*Editor Forest and Stream:* I have just returned from an outing about Falmouth, Cape Cod. I went back five miles into the country, and never heard a Bob White. I didn't learn anything favorable from the natives as to the prospect for the quail crop. I heard quite a number whistling in Carver, Plymouth county; in fact, first I have heard this year. Around here, in Essex county, I learn of only a very few; heard of a bunch of five being found dead after the snow melted. Without a doubt our quail in Massachusetts suffered badly from the February blizzard. Partridges stood it all right, and have nested well; been a dry, favorable season for the young bird. There seemed to be as many woodcock and snipe along as ever. Large flight of yellow-legs passed about May 1 on the shore marshes. I hear many were killed for market by an Ipswich shooter, who was allowed to shoot out of season by a local game warden, who claimed there was "nothing in it for him" by prosecuting him. That's a fine "warden."

JOHN W. BARRITT.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Mountain Trout.

THE trout in the streams of this part of West Virginia, where the waters head, appear more numerous than usual this year, and it has caused me to do some thinking. I have come to believe that incessant fishing is not the sole cause of the decline in the number of trout that this country has seen, for the fishing has been kept up and there is no question but that the trout have been increasing during the past few years. I believe the "game hog" has been blamed with what the droughts of some years ago caused. The past two seasons have been wet, and the trout have thrived. I do not like the term "game hog." It is more easy to tell who is not a "game hog." For instance, my confessedly impatient but really unskillful friend, who has no luck, is no "game hog," but he blames unnumbered generations with depleting the waters; for, having caught no fish, he takes it there are no fish. Men used to go into the mountain here and stop fishing when they had all they could carry out. But it is not for me to say, "Thou game hog!" They only helped themselves to what nature provided so bountifully. It is the men who cut the trees who destroy the trout. When waters get low trout do not thrive. They are at the mercy of all their enemies. Hear an incident of the dry summer of '88:

A fisherman on Tea Creek was sitting on a fallen tree, when he saw an old mother raccoon and a lot of cubs come into the bed of the stream. The old one took to turning up rocks and catching little trout, some of which she ate, giving the rest to her family. The fisherman observed her a long time, and being a very zealous defender of the trout at all times unslung his rifle and shot her. As an example of maternal care, it was a very affecting sight, but when a coon turns from its legitimate pursuits to take advantage of a drought to fish how can it hope to escape the wrath of the fishermen?

The writer tries not to mind what others do to fish, for it only makes him pessimistic. The outrages are just as real and as hard to get at as those of the body politic. We will be content if we can act well our part and trust to others not to abuse the bounties of nature. But there is a custom here that should be broken up, and that is quite an extensive practice of trading a pound of bass or trout for a pound of bacon. There is rarely any other traffic in fish here. The improvident mountaineer who has eaten up his scanty store of bacon will appear at some comfortable farmhouse with his string of trout, where he knows that they will pass current for bacon at the fixed and unchanging ratio of 1 to 1. A week or so ago a man who was hungry for hog meat fished down Beechy for a few miles, and turned up at a lumber camp with 108 trout, where he cashed them in for 12 lbs. of bacon, standard weight and fineness. We do not object to the traffic so much as we do to the standard of value.

But we have been fishing for meat. Four of us said that clients could wait while we went to the Meadows one whole day sucker fishing. Our party accounted for about all the local bar at home that day, and therefore a legal holiday was declared. Reports came in that the William's River red-horse suckers were swarming on the riffles by the thousand from out of the Deadwater, and the *hoi polloi* were taking them by the wagon-load. This sucker is a most edible fish, and it is a sight to see them running the riffles when they come up to spawn. We have been there for several years to meet them, and we were telling a very pretty story of how it took just the same number of warm days the last of April to make us go camping that brought the fish forth from the deep water to spawn. But this year we were not there to greet them with spears and horse-hair dills. Our scheme was to get up before daylight, ride the twelve miles, take a hundred-weight or so each and go home loaded. We actually got away before daylight, and after a very pleasant ride through pine woods reached the Meadows about breakfast time. There we found no outside suckers. It was easy to see why. The banks were torn and trampled and the offal of fish was scattered around. The suckers had been so harried that they had been driven back to the security of the deep water. Then we tore our hair and rended our clothes because we had not brought our trout tackle. It was a warm cloudy morning, when the trout are supposed to bite. One had a fish basket, which I immediately borrowed, for I had found two leaders in an old pocketbook I had my sucker fixings in. I had to be content with a green beech pole, and after a lot of hard work I had a fine lot of fishing worms. By 10 o'clock I was established on the ruins of a disastrous enterprise, full of hope of making the day a success. It was an ideal trout day—seem-

ingly ready to rain any minute, but the rain never coming. The first pool was where the water swirled against the bank, and moved the submerged boughs of willow unceasingly. Here a big trout took the bait, and after quite a lot of argument the beech pole, encouraged by me, flung it high in the air, and on the bank. It's the fool behind the rod that does the work. One cast, and one trout is all the best of tackle could have done.

It was a great day. I think I must have taken a hundred, for when the time for taking stock came there were sixty-six trout in the creel, and their weight was making the strap cut into the shoulder. I had to overcome another difficulty. When I had caught about half the lot I was standing kneep-deep in the stream, where the current swirled around me. My bait was in an old oyster tin. In returning it to my pocket it fell in the water, and all my precious bait was swept away. It was just above a fine pool, and though it was expensive it set the big trout to biting, and I took out four fine fish before the remnant of bait was exhausted. I have seen many a fisherman give up all hope of catching a fish and throw away his bait as he turned from the water. If he had thrown in the greater part of the bait and continued fishing the chances are that he would have made a glorious finish.

But my bait gone, I was again a ruined man. In that old pocketbook was a solitary trout fly of the coachman variety, and I turned to fish down stream with it. The beech did not do so bad, but it was wearying. It hurt me between the shoulders. But how the trout did swarm around it and dive out of sight again! I was sorry they were dissatisfied, but I had nothing else to set before them. But about every tenth fish would take it and be caught, and I made better speed than ever.

About 4 o'clock I started home, and came on a hilarious crowd of my neighbors, who, having come for suckers, had stayed to have a good time. With them was the town preacher, who had ill-advisedly accepted an invitation to go fishing with that crowd. They had placed the preacher's name in an empty bottle, which had been recently emptied, and set it afloat, and had otherwise outraged the cloth. My own crowd, seeing the game was up, had trailed off home earlier in the day. Taking the preacher with me, for I thought he looked uneasy, we rode home, discussing theological questions, for I soon found that on nothing else would the worthy man talk with animation. He tried to talk on my hobby—fish—and speak of a startling discovery he had that day made, which was that "trout have teeth," but when I showed him that forefinger of mine roughened with the taking of a lot of trout from the hook he let the talk languish.

My youngest brother has had an experience the thought of which takes me back to my first attempts at camping. He and another youngster have just returned from a trouting expedition nearly dead from loss of sleep. Briefly related, this is what they did: Up at 2 o'clock, walked fifteen miles and fished till dark. Set to making camp in the heart of the wilderness. Fire would not burn with soggy wood, and nobody could eat the cooking save only the dog. Could not sleep and had no watch to tell how the night was passing. Sat at foot of a big tree and heard the owls hoot all night. Dawn came after a week or so, and they made a breakfast of corn pone. Just as they started away the log heap they had labored over the whole night broke into a cheerful blaze, and they turned back and warmed the very marrow in their bones. Fished until noon and walked about eighteen miles home. They caught 140 trout, and are anxious to try it again. They believe they know how to occupy a department in the woods gracefully and have several pointers on making themselves comfortable. They say they had over 20 lbs. of grub to throw away, mostly bread, for which they had placed a large order with their mothers.

I had fixed last Saturday to go a-fishing, but the date conflicted with a cold wave, and Friday evening there arose live issue as to whether the garden should be protected from the frost. I was for risking it, but the mistress of the household was willing to take no chances, and the garden was draped with all the spare "kivers" on the place. As we sat around a fire that evening which would have warmed a room in midwinter the prospect looked blue, for cold waves and fishing do not go well together. Clouds came, and no frost, but while I was trying to make myself believe the air was soft an old darky came by and remarked, "'Pears like it was too col' to fros'." The inexperienced might think I had scored a point when I had my prediction verified as to the safety of the garden, but I was informed that what we had done to keep off the frost was right. I have tried in my time to impress a quotation from Hans Christian Andersen on a certain lady's mind, "Whatever the old man does is always right," with very poor success, and the frosts that never come are the bane of this fisherman's life in more ways than one.

The only comfort I could take was that signs amount to nothing if the fish only bite. I reached the stream about 9 o'clock, and by that time I had arranged to have the fish bite, because the air was too cold for insects to be flying about, and therefore fish would be hungry. A fisherman who is not sanguine is a rare bird. I fished down Laurel Creek three miles or so to its mouth. It was through a dense spruce forest. The way was rough and the water cold, but the trout did bite, and in a most peculiar manner. There is little individuality in the trout, and this day each took the bait and nibbled at it for several minutes. All a man could do was to wait until the bait was absorbed, and if the fish had swallowed the hook all was well. If not given enough time, it would be lifted from the water and fall back. Nearly every fish had swallowed the hook which was taken. When I arrived at the mouth of the stream I had thirty-four trout, and had done far better than I had expected. In a deep pool in the river I tried an experiment, which resulted in some big fish to finish with. It was getting late, and I threw nearly all my bait in the head of the pool. The fish began to bite in earnest, and I soon caught eight, ranging from 9 to 13 in. The sport was more than satisfying on that day, when a wise man would not have gone forth. Two hooks were lost on those monsters which always get away. I marveled at their size, and thought of the immensity of the tale I should tell. My honest intentions were nipped in the bud by finding one of the hooks in the stomach of a gin. trout, th

smallest of the catch in that pool. A four-mile walk with a heavy creel of fish was the next incident of a good day's work, and an eight-mile horseback ride completed it.

MARLINTON, W. Va.

ANDREW PRICE.

The Aureolus in Vermont.

COLD SPRING HOUSE, Averill, Vt., June 2.—*Editor Forest and Stream:* A few days ago I read an article in your paper, from the pen of Mr. A. N. Cheney, on the subject of the aureolus or golden trout, in which the writer stated that they were only to be found as inhabiting Sunapee Lake, and one pond in New Hampshire, and one pond in Maine. When I read that article I fully believed it to be true.

In this township in the northern county of Vermont, lying about six miles from the Connecticut River, or boundary line between New Hampshire and Vermont, and about five miles from the line between Canada and Vermont, are three ponds in a chain, and only about one-half mile distant from each other. On the shore of the most easterly, or Leach Pond, is the Cold Spring House. This pond is inhabited by spotted or brook trout exclusively, and is one of the finest of the kind, and contains by actual measurement 114 acres. About one-half mile west of this is Great Averill Pond, containing 1,300 acres, and about three miles long, and one of the most beautiful sheets of water in New England. Southwest from Great Averill about one-half mile is Little Averill Pond (so called), which contains 800 acres, and is also a very beautiful sheet of water. Both of the so-called Averill ponds are very deep, soundings having been made showing over 200ft. of water. They have both been in the past for many years very prolific of large speckled trout. I have taken trout in the larger pond weighing 5lbs., and I know of one being taken in Little Averill which tipped the beam at a trifle over 11lbs.

I never knew of any other variety of fish being taken in any of these three ponds except speckled trout, until perhaps seven or eight years ago some of the natives of Averill (of whom there are few) and of Canaan, east of Averill, and Norton, on the west, began to tell of taking salmon from the two (so called) Averill ponds. I never believed that there were salmon in the ponds, and supposed that the large fish taken by the natives, and by them supposed to be salmon, were only very large trout. Mr. Noyes came here to take charge of this sportsman's camp two years ago, and very soon after taking possession began to tell me of the fine salmon that were being brought into camp from these waters. From the best description I could get from him, I at once came to two conclusions—first, that the fish was not a salmon, neither was it a speckled trout. I requested him to send me a specimen. On May 25 last, he sent me a fine male specimen weighing, "dressed weight," 6½lbs. At once on taking the cover from the box containing it, I exclaimed "Aureolus." After showing the fish to friends I sent it away. Two or three days after, I saw my colleague on the commission, Hon. N. Wentworth, and told him I had received a fine specimen of aureolus taken from the Averill, Vt., waters, and sent me by Mr. Noyes. He asked me for a description, and when I told him of the coloring of this fish he told me I was mistaken, it was not an aureolus.

Mr. Wentworth having seen hundreds of these golden beauties to my having seen one, of course I was not too positive, but urged him to come here with me and look the matter up. We arrived here this afternoon, and immediately on our arrival Mr. Noyes, at our request, produced from his cold storage a number of fish, among which were several specimens of the natives' salmon. Mr. Wentworth at once and without any hesitation pronounced them aureolus.

In less than an hour after our arrival, while we were sitting on the veranda discussing the question of how and when these fish could have got into or have been put into these waters, a man and his wife came, bringing in somewhere about a dozen of these fish, weighing from 1 to 4lbs., and one which weighed, dressed, 3lbs. This fish was caught to-day by the lady in the Little Averill, and was taken trolling with minnow. We are wholly unable to account for the presence of this variety of fish in these waters. There is no record of any being taken prior to eight to ten years ago. Certainly they were never put there by the Vermont Fish and Game Commission, for they obtained from us the past winter 10,000 eggs for the purpose of introducing them into Vermont waters.

WM. H. SHURTLEFF.

COLD SPRING HOUSE, Averill, Vt., June 2.—*Editor Forest and Stream:* My reason for doubting Mr. Shurtleff's statement that he received an aureolus from Vermont, was by the way he described the coloring of the fish. The fish, weighing 8lbs., was 25in. in length. It was not nearly so stocky a fish as those found in Sunapee Lake, for the reason that there are no smelt in these waters. In fact, all the specimens we examined showed plainly that they were ill-fed. Their coloring is beautiful, very nearly as brilliant as those taken from the spawning beds of Sunapee Lake in the fall. There is no question that these waters are teeming with them. Mr. Noyes tells me of one party that took 200lbs. of these beautiful fish in one day. It is something wonderful that the fish have not been identified before. I have seen thousands of these fish taken from New Hampshire waters within the last few years, and there is no question that the specimens we have seen to-day are the aureolus, Sunapee saibling or golden trout. I inclose you paper pattern of the large one taken here to-day.

On Trout Lake.

"In the spring a young man's fancy
Lightly turns to thoughts of love."

THAT may have been true in the olden times, but now the young man's fancy turns to crystal lakes and babbling brooks, and the gamy muscalonge, bass and trout that lurk therein and whose pursuit and capture afford many a pleasant hour's anticipation and discussion before the winter fire.

A few springs ago this fancy turned the eyes of the writer, his brother Tod and a small mutual friend, an M. D., toward Trout Lake, Vilas county, Wisconsin, the most beautiful lake on the Chicago & Northwestern system. We shipped our tents, provisions and canoes a week ahead. Our guides portaged them over from Woodruff to the lake and prepared our camp. A wagon road had just been opened to the lake, a typical piny woods road. When half-way across it began to rain; later it turned cold, and we got to the lake more dead than alive. We

SQUAW AND PAPPOOSE.

found a nice camp, warm fire, splendid supper and most comfortable balsam beds awaiting us. We thawed out and then we ate, and then how we did sleep!

Next morning bright and early we started, and each came in happy with a fine lot of trout. They were all a fisherman could ask for either game qualities on the hook or flavor on the table. It turned quite cold—the water froze in our buckets, but the colder it got the better the trout bit and fought. Tod had never caught a muscalonge, so the third day we portaged to Muscalonge Lake and he caught his first one—an 8-pounder. How his eyes

RUNNING THE RAPIDS.

popped out when it struck and left the water. He fought it well and soon brought it to gaff. Two others followed, and we returned to camp happy and satisfied.

The next day while trolling for trout in the Upper Lake, Tod got one of those quiet gentle strikes in which a muscalonge sometimes indulges. We had seen no one who caught a 'lunge in Trout Lake, so of course, not dreaming of such luck, he snubbed it as if it were a small trout. But he was deceived. While it fought deep and would not come to the surface, it pulled, as he expressed it, "like a yoke of oxen," and kept him very busy for fifteen minutes. We were all speculative—a giant trout we declared. Finally it broke water and came out fully 2ft., and soon the handsomest 'lunge I ever saw was his. It weighed 18lbs. Continuing round the lake off the big bar we struck quite a school of trout, and trolling with a small spoon on the end of the leader and two bass flies above it, on two occasions we landed three trout at once, and thrice we landed doubles, and on our return to camp we forwarded a barrel of these delicious fish to our good friends at home.

The next day was Sunday. No fishing was agreed. A party of Indians having camped on the old Indian clearing near us, we visited them and secured good pictures of the buck, squaw and pappoose who comprised our interesting neighbors. They were shy at first, but our small friend, the physician, has a way about him that neither man, woman nor child was ever known to resist, and they soon became quite friendly. We went over in our boat.

On our way back Tod began skylarking, when our small friend proposed we tip the boat over. No sooner said than done—over I turned it in about 3ft. of water. The Doctor was half-way round and struck the water head foremost. His feet may have escaped wetting the first plunge, but I'm sure no other part of him did. Tod and the guide Hank were wrestling in the bottom of the boat, and I saw the water close over their heads as they went in clasped in each other's arms. Holding the camera above water, I made for camp on the double quick. My gun alone, I think, saved me from something awful. It was cold—so, so cold! They had to change their clothes. They have not forgiven me yet, but a cup of coffee and some lunch partially reconciled them, and we discussed our plans for the morrow.

The 18lb. 'lunge had fired Tod's ambition. The guide's reports of great catches in Boulder and Crooked lakes fanned it to a fever heat. Dock concluded that his state of health would not permit him to make the four-mile carry between Trout and Boulder lakes, so Tod and I, with Hank and two other guides, started at daybreak on Monday. We reached Boulder by 1 o'clock, and fished it and Crooked until dusk, and the next morning until 12 o'clock, when we turned homeward. I had caught thirteen 'lunge; Tod seven, but his were the largest. I wanted a 20lb. 'lunge, and kept my spoon in the water up to the last moment. Just as we entered the Manitowish River something took my spoon with such force as to nearly upset me. The channel was contracted here by bullrushes to a width of 12 to 15ft. Out of the water he came, and I saw I had hooked the fish I wanted. All the guide could do was to pull our Peterboro into the bullrushes and hold us there by grasping them in his hands. I stood up and made the fight, and it was the grandest I ever saw. Six times he left the water, and the narrow channel seemed a mass of foam to my excited imagination. Finally good tackle and perseverance conquered, and we brought to gaff a 'lunge rising 19lbs. in weight, and home I started in that good humor which none but the successful fisherman can know.

After a hard pull and hard work, we made the carry and intervening lakes and reached our camp about 9 o'clock, tired, cold and hungry. Approaching our sleeping tent we heard the most unaccountable exclamations from our small friend—the mildest of which was, "darn the infernal thing." Hurrying in we took one look and then threw ourselves on the ground and laughed till the tears came. "Oh, now, boys, come help me," finally brought us to his assistance and relief. The Doctor, though called our small friend, is 6ft. 2in. tall, and weighs over 300lbs. I alone of the party possessed a sleeping bag. The devil tempted the Doctor to try it. He got half in, then stuck, and there he was unable to extricate himself. He was pretty sore over the matter, but his unflinching good nature soon set him to laughing with the rest of us. The expression on his face when we entered the tent has brought many a laugh to my lips in the years that have passed.

Next day we shipped out fish, and two days later a business engagement of the writer's compelled us to break camp and terminate one of the most pleasant and successful outings of my life.

BOB RIDLEY.

An Adirondack Trout Record.

Editor Forest and Stream:

I returned last evening from a short trip through the Adirondacks, which were never more beautiful than now, the dark evergreens standing out in bold relief against the light green of the deciduous trees. To the lover of flowers the purple azaleas, moccasin flowers, laurel and trilliums are a continual source of delight. The carriage road north of the Fulton Chain of Lakes, extending east from Old Forge and connecting with the Durant road and other highways, is now in excellent condition for both carriage and wheel. I am told that the old road from Boonville to Old Forge via Moose River has been improved so that a wheel ride over that route is feasible, most of the road being good, and but two miles so poor as to make pushing the wheel preferable. This makes possible a delightful trip from civilization to Racquette Lake and beyond.

The lakes and streams in this section are yet high, and the fishing will be better a little later, although good catches are already reported. That genial angler of Fourth Lake, Robert Perrie, gave me an interesting bit of information in regard to the rainbow trout, which were planted at the foot of Fourth Lake by the Caledonia Hatchery, March 10, 1899. They were 3in. in length when placed in the water, and now take the fly readily. Last week Mr. C. L. Chapman, of Clayville, caught and returned two of them which measured 5in. They are evidently growing rapidly, and their early activity and gaminess promise well for the sportsmen of the future who shall angle on the Chain. Several large catches have been made on Seventh Lake and vicinity. Four trout weighing 13lbs. is the record so far. Less building is in evidence this year, but the many hotels and camps are ready for the season at hand.

Fewer deer are found in this locality than usual. The winter was severe, but the reason is largely local perhaps. Very heavy blasting has been done in connection with the road building, and this has doubtless driven the deer away. The Pneumatic Railroad from Lake Clear, the first station north of Fulton Chain to a point near Sam Dunnigan's camp on Fourth Lake of the Fulton Chain, is well under way, and will be in operation the present season. This will make still easier the journey to Racquette and Blue Mountain lakes from the west side of the woods. A carriage road from Fourth Lake to Big Moose is also nearing completion. These highways will not tend to increase the number of deer and game generally, but the pleasure which they afford in delightful drives and rides makes for them a welcome even with the most conservative.

The fishing about Tupper Lake is also reported excellent, and many good catches have been made. The large mill there is not in operation, which does not conduce to the business prosperity of Tupper Lake village, but gives the inhabitants a chance to fish, which they are improving.

Mr. F. W. Loomis, of Saranac Lake village, who knows everything about fish and how to catch them, gave me the

photograph which I inclose. It shows five trout caught by F. C. Lamy and John Marquay in Ampersand Pond, twelve miles from Saranac Lake. The fish weighed 6½, 5½, 5½, 4½ and 3¾ lbs., total 25¾ lbs. The fish were exhibited at Saranac, and astonished everyone who saw them, as a catch of five brook trout averaging over 5 lbs. each is almost unheard of in this State. There is no question as to the authenticity of this catch. Mr. Lamy told me that the largest fish was taken on a No. 5 kidney spoon. Other large catches have been made about Saranac, but nothing to compare with this record breaker.

Throughout the woods the feeling seems to be general that the best season yet, in every particular, is at hand. Surely the pleasures of the woods are becoming more diversified, and while the game may be decreasing in parts, this year will probably find more people enjoying the Adirondacks than ever before. Just now the flies are rather troublesome, but if you follow Mr. Chamber's advice in his "Guide to Canadian Fishing," and put a small phial of oil of Lemon Verbena in your vest pocket, you may enjoy the beauties of forest and stream unmolested.

JOHN B. McHARG, JR.

ROME, N. Y., May 31.

New England Fishing.

BOSTON, June 10.—Fishing trips continue to be in order, and a good deal of enjoyment seems to come from these trips, even to the just-initiated. H. C. Williams and C. T. Turner, neither of whom had ever fished before, came home from Newfound Lake, N. H., the other day. They had fished for three days with the result of two or three big trout and a salmon for Mr. Williams of 6 lbs., and one for Mr. Turner of 4½ lbs. Both are converts to angling, and will go again. Herbert D. Turner, of Arlington, and J. W. Fellows, of Boston, are back from a fishing trip to Newfound Lake, N. H. They had good luck, Mr. Turner catching two salmon—one of 8 and one of 4½ lbs. Mr. Fellows landed a lake trout of 7½ lbs. They were there

camp, Lake Mooselucmaguntic, came out on Monday, and immediately started for the Restigouche for a few weeks' salmon fishing. Mr. D. H. Blanchard, of Boston, will start for his river, the Northeast Branch of the St. Marguerite, as soon as he gets word that the salmon are rising, which good news he is expecting daily. The fishing tackle people say that an unusually large number of salmon fishermen are fitting out.

Better success with landlocked salmon is reported on Lake Auburn, Me. Mr. B. A. Dresser took a salmon of 10 lbs. there on Saturday. Mr. Henry Wetmore has landed one of 4 lbs. and one of 5½ lbs. Mr. J. E. Coombs has landed a good one, and hooked another which he believes to have weighed at least 10 lbs., but the monster got away.

BOSTON, June 12.—There is no doubt that Canadian waters are yet to afford sportsmen from the States the delights of angling which the too-severely-fished waters nearer home will ere long fail to give. It is a feature of the times that sporting clubs are forming and the control of Canadian waters being obtained. The Laurentian Club is one of these. A membership of fifty-three, with a limit of sixty, I understand, is made up of thorough sportsmen. The club has obtained control of 400 square miles of territory above Quebec, on the Batis-can River, and on the line of the railway from Quebec to Lake St. John. The territory is well wooded and has many lakes and watercourses, all abounding in trout. Mr. Tausig, of Boston, an enthusiastic angler, and an influential member of the club, is just back from his spring fishing trip, and his description of the fly-fishing would charm the angler who has to cast for hours to get a rise in Maine waters. This trip he fished two or three new lakes and ponds, and there are many others to cut port-ages to and fish. No very large trout have yet been taken, Mr. Tausig's largest this spring being about 3 lbs., but the supply is most abundant. This supply the club proposes to preserve. No trolling or bait fishing is allowed—only fly-fishing. Mr. Tausig found the Parmacheene-belle to be just as good as in Maine waters, and this, with a silver doctor or Montreal and brown hackel, made the

ANGLING NOTES.

Kipling Kills Pacific Salmon with the Fly.

LAST season while fishing for salmon in the Restigouche, the conversation turned one evening to the Pacific salmon, and a gentleman present made the statement that he would wager \$10,000 that he could go to a Pacific Coast stream and kill Pacific salmon in the same manner that he had that day killed Atlantic salmon with the fly in the Restigouche, and I thought when he made the statement that he could do exactly as he said. The wager was not for the purpose of making money, as he explained, but he wished to be assured if he succeeded of sufficient return to pay the expenses of the trip, for he would go simply to decide the matter, for it was generally understood that Pacific salmon would not take the fly. One of the first stories I ever heard in relation to Alaska after the purchase was made by this country, was of the old Scotch Admiral who said, "Let the Yankees have the blank country; the salmon will not rise to the fly." From that time until this I have not heard of Pacific salmon being taken with the fly (except that possibly Admiral Beardslee did write me that he killed a fish or so when he was in Alaska with the Jamestown, but of this I am not sure now), although I know of a number of efforts in this direction—one by a well-known Eastern salmon fisherman—until a few days ago someone left on my desk a copy of Kipling's "American Notes," and I opened the book to find that Kipling has been successful in killing Pacific salmon with the fly. Twice I read the chapter to make sure that my eyes had not deceived me, but he states clearly and positively that his salmon were killed on the fly. There is no mistaking that Kipling is a fisherman. The chapter to which I refer begins: "I have lived! The American Continent may now sink under the sea, for I have taken the best that it yields, and the best was neither dollars nor real estate." The "best that it yields" was a Chinook salmon, or several of them, and how the salmon were killed is told as perhaps only Kipling can tell it. First his companion "California let the gaudy fly drop in the tail of a rifle. I was getting my rod together, when I heard the joyous shriek of the reel and the yells of California, and then 3 ft. of living silver leaped into the air far across the water."

There is no mistake about the fly in this case, nor in the next. Kipling's own: "I went into that ice-cold river and made my cast just above the weir. * * * The next cast—oh, the pride of it, the regal splendor of it! The thrill that ran down from fingertip to toe! Then the water boiled. He broke for the fly and got it. There remained enough sense in me to give him all he wanted when he jumped not once, but twenty times, before the up-stream flight that ran my line out to the last half-dozen turns, and I saw the nickled reel-bar glitter under the thinning green coils. My thumb was burned deep when I strove to stopper the line. I did not feel it till later, for my soul was out in the dancing weir, praying for him to turn ere he took my tackle away. And my prayer was heard. As I bowed back, the butt of the rod on my left hip bone and the top joint dipping like unto a weeping willow, he turned and accepted each inch of slack that I could by any means get in as a favor from on high. There lie several sorts of successes in this world that taste well in the moment of enjoyment, but I question whether the stealthy theft of line from an able-bodied salmon who knows exactly what you are doing and why you are doing it, is not sweeter than any other victory within human scope."

There is much more of this told in inimitable style before the salmon is finally landed by being thrown on the banks by the hands of the fisherman, for Kipling would not have the fish gaffed, but finally the fish is killed and Kipling sings praises to him: "The beauty, the darling, the daisy, my salmon Bahadur weighing 12 lbs., and I have been seven and thirty minutes bringing him to bank! He had been lightly hooked on the angle of the right jaw, and the hook had not wearied him. That hour I sat among princes and crowned heads greater than them all."

It is all well worth reading, and even re-reading; but a little further along there is a very suspicious admission for a man who has been killing salmon with the fly, and here it is: "Then Portland took my rod and caught some 10-pounders, and my spoon was carried away by an unknown leviathan."

This may be a pirated edition of Kipling's book; the spoon may not be in an authorized edition, but in the volume before me the spoon is as much in evidence as the fly, except that the spoon is mentioned but once and the fly twice. Now, what I would really like to know is this: Were the salmon killed on a fly or on a spoon? If I can find out I will, in return for the information, give Mr. Kipling what I believe to be sound advice—to keep his hand off his line and not try to stopper it when his fish is running, if he wishes to contemplate his serene highness dead on the bank as a daisy and a darling.

Aquaria for Schools.

During the past winter I one day received a letter asking about fish and plants for an aquarium, and how to care for the fish and plants. Up to this time I have received over fifty letters upon this subject, all asking for about the same kind of information, and what the future will bring me no man can tell. It was some weeks before I found out how the school teachers of the country happened to be writing to me for aquarium fish and plants, but the following letter is a fair sample of all, and contains the why of it: "I saw in the Teachers' Leaflet from Cornell University that those who wished to obtain fish to study should write to you, and that you would tell what species are suited to life in still water, and how to get what you do not furnish, and how to take care of them. I would like to make an aquarium for school use, and I would like information as to how to stock it, what plants to use and what fish to keep."

Thus far I have faithfully replied to all questions, but to-day the stenographer asked if I expected to keep up the burden through the summer, and therefore I hope that the school teachers who have not written and have a desire to write are readers of FOREST AND STREAM, for I would like to say to them that the State of New York does not rear aquarium fish of the kind they would ask

FIVE ADIRONDACK TROUT AVERAGING OVER 5 LBS. EACH.

only two days, and are much pleased with their success in so short a time.

Trips for fishing in Maine waters are growing in popularity each season. Almost every day one meets with a merchant who is respectably browned and looks hale and hearty. Inquiry elicits the fact that he has been to Maine fishing, and an account of his trip is given with delight to a listener who has been there. Mr. C. T. Williams, of Boston, is home from the Rangeleys, where he is very fond of going. He visited the Birches, Mooselucmaguntic, and had good success, taking several fine trout. Mr. W. J. Leckie, of Boston, has returned from his annual trouting trip to the Northwest Branch of the Penobscot. With Mr. G. W. Brown and others he is interested in a camp on a pond that they do not like to name, because "the fishing is too good to give away." This time the party consisted of James L. Richards, W. J. Follett, Charles H. Hall and John Touleman, with Mr. Leckie and Mr. Brown. They had excellent fly-fishing, taking all the trout they desired. This party never fishes with bait of any sort—only with the fly. Such is the rule of the camp, and the gentlemen, all prominent merchants or bankers, are justly proud of their achievements. Large trout are not taken, because not in the pond, but always a plenty of them. One of the earliest of Boston fly-fishermen is Mr. Frank F. Dodge, who owns a camp on a lake in Nova Scotia. With his wife and son and a friend they visited this lake early in May and found excellent fly-fishing, the party taking several "good ones" and all they wanted of fair size. Mr. Dodge grows more enthusiastic over his location every year. The fly-fishing is early. The guides are trustworthy and have not yet been spoiled by sportsmen with longer purses than good sense. Mr. Frank Wise, of Boston, and Mr. Charle Boss, of Meriden, Conn., have recently returned from their second or third annual trout-fishing trip to Tuskent River, Nova Scotia. They go first to Yarmouth, thence to Brazil Lake, thence to Tuskent River. Here they had good sport fly-fishing, with some trout of very good size for that country. They are fond of camping out there, though they can stop at farmhouses at very reasonable prices, and everything possible is done for their comfort. They have no trouble with the customs officials, who seem willing to do all in their power for sportsmen from the States.

The salmon fishermen are fitting out for their rivers, and some of them have already gone. Senator Frye, with Senator Chandler, who has been a guest at Mr. Frye's

ideal cast. Mr. Tausig fished Lake Alex and Lake Eau Claire, the later, as its name indicates, noted for its clear water. It has been considered heretofore almost too clear for good trout fishing, but Mr. Tausig was able to take some most beautiful trout there of good size.

Considerable catches continue to be reported from the Rangeleys. Mr. C. T. Dunklee, of Boston, has been there, fishing at Bemis and other points. He took over thirty fish, one a trout of 5 lbs. C. E. Barker, of Lynn, took a salmon the other day while fishing from the Upper Dam wharf, Richardson Lake. It weighed over 7 lbs. Dr. M. F. Galvin and J. J. McNulty, of Boston, have had good success at the Birches. They have also visited Seven Ponds, where, in a half-hour's fishing, Mr. McNulty landed twenty trout. Mr. and Mrs. N. N. Thayer, of Boston, have made a remarkably good catch of fish, including fine trout of 2 lbs. each; four, 3 lbs.; four, 3½ lbs.; one, 4 lbs.; one, 4½ lbs.; one, 5½ lbs., and one salmon, 3 lbs.

Mr. T. B. Stuart, of New York, an old-time angler at the Upper Dam, is there for his annual outing. Mr. C. H. Haynes, of Boston, has taken over seventy fish at the Upper Dam this season. One day's catch was five salmon, weighing 25 lbs. Mr. Eugene Lynch and M. H. Curly, of Boston, are at the Upper Dam, and having their usual good success. A hearing is to be held at the Upper Dam on Saturday, before the Fish and Game Commissioners, on a proposition to stop all night fishing.

Reports from Kineo, Moosehead Lake, say that fishing is better there than ever. The L. E. Pierce party, of Boston, or, as it is familiarly called, "The Moosehead Total Abstinence Club," is again out of the woods. Generally good fishing is reported, though some members did not have great success. The party this year was composed of Commodore L. E. Pierce, Boston; H. C. Dilworth, East Orange, N. J.; W. F. Perkins, Wakefield, Mass.; E. Smith, Warren, Mass.; C. W. Cheency, S. R. Ellis, J. H. Davis, W. T. Bullard, G. A. Yates, Boston; B. J. Nelson, Worcester; Frank Fitzpatrick, Cambridge; F. M. Dean, St. Albans, Vt., and J. E. Dilmas, Brooklyn, N. Y.

Good sport is reported from Rangeley Lake. The other day the guests at the Rangeley Lake House were watching from the piazza five boats with fishermen, all within speaking distance. Within half an hour six salmon had been taken, all in the boats at the same time.

Mr. Wm. B. Smart, of Boston, is off for his annual fly-fishing trip to Redington, Me.

SPECIAL.

about, and it does not maintain aquaria or plants for aquaria. All the spring spawning fishes hatched by the State, such as shad, smelt and pike-perch, are distributed and planted as soon as they are hatched and ready to feed, and the fall spawning fishes would not live in an aquarium without an abundance of cool running water, which an ordinary school aquarium would not be likely to furnish. The more satisfactory way to establish an aquarium and stock it and balance it with plant life to produce oxygen which the fishes consume, after which the aquarium requires no water except to replace what is evaporated, would be read the exhaustive article in *FOREST AND STREAM*, Dec. 25, 1897, and then buy the fish and plants of some dealer who advertises in *FOREST AND STREAM*, and if they do not advertise they should, because I speak from experience when I say that this season there seems to be a boom in aquaria and aquaria supplies. That is the best that I can do, and I sincerely regret that I can do no more to furnish aquaria for school purposes. The idea of educating school children to understand something of the habits of our fishes is a most commendable one, and is in line with the idea of Dr. John D. Quackenbos, which he carried out in a school geography to teach the children the breeding seasons of all game birds and fishes, and as each State in the Union was under review the fish and game laws of the State were given; that as the children were taught that Albany was the Capital of New York, and that it was bounded, etc., that certain birds and animals could be legally killed only at certain times, and that fishes could be legally caught with hook and line only at certain seasons, and that they must not be caught at other seasons or by other means at any time.

Perch Over 100lbs. in Weight.

Mr. Alfred Jardine, the mighty pike fisherman, of England, who, perhaps, has caught more large pike, or, as we call the fish, pickerel, than any man since pike fishing with fine tackle became one of the higher branches of angling, writes in the *Gazette* of some mammoth perch which are to be found in the waters of Australia, and there considered the best of the native fishes. Specimens weighing from 120 to 130lbs. have been taken, and Frank Buckland advocated the introduction of this giant perch into the waters of Great Britain. Since Mr. Mygatt received a blow in the neck from the tail of a tarpon which rendered him unconscious for three hours, and Mr. Horder and two companions were overturned in their boat and in deadly peril because a leaping tuna did not take kindly to the gaff when brought alongside, it may not be necessary to introduce any more large fish to our waters to provide exciting sport for our anglers, but it is interesting to know that a member of the perch family grows to such great weight, and is entitled to be called the largest of all fresh-water fish, as it exceeds in weight the great Mahseer of India, which has been compared in its fighting qualities to the kingly salmon, although I have an idea that the salmon would protest, if it could, at being put into a class with this carp. If another reason is required why we do not wish to try this big perch in our waters, Mr. Jardine gives it when he says: "We tried it cooked three ways, viz., baked with savory stuffing, fried in fillets, and boiled with sauce of parsley and butter; and it was better than good mullet."

Once I was asked to a dinner where a fish of German origin, which has been landed "in our midst" to increase the profanity habit of our people, was the chief item of the menu, and it was cooked in red wine and white wine (and possibly in blue wine), and with savory stuffing, and it was good; but I am of the opinion that if a nice tender bootleg (one of the kind that I had when a boy, with red tops and gilt eagle birds on them) had been served in those wines and those savory stuffings and sauces, it would have passed and received the same verdict as was awarded to the fish, for the diners consumed more trimming than fish.

As one of our common people, I think it safe to say that we are not suffering for the introduction of any more fish into our waters to feed our 70,000,000 of patriotic inhabitants, if the fish to be palatable has to be cooked in red, white and blue wine with trimmings, but inside of twelve months somebody will wish to try this great perch in our waters and plant it in some mountain trout brook, or else history will not repeat itself.

Salvelinus Marstonii.

Having had the pleasure of naming this fish after Mr. Marston, I have ever since been interested in it, and have made several ineffectual attempts to obtain specimens, hoping to send some to Mr. Marston, that he might see the fish named after him, but up to this time I have not succeeded. The first and only specimens that I have seen of the Marston trout come from Lac de Marbre, in Ottawa county, Quebec. I saw a notice of this fish in a newspaper, and sent it to Mr. Marston, who printed it in the *Gazette* (London), and said: "If some of our friends in the Tourilli Club would send me in ice a good specimen of *Salmo marstonii*, I would be extremely obliged, and will pay all expenses of carriage. For years I have been hearing about this game and handsome namesake, and should like one stuffed in my fishing den. If I do not see or catch *S. marstonii* before I die, I shall begin to think it's 'all my eye.' " The clipping is, I assume to be, a printed statement of Dr. Evermann, Ichthyologist of the U. S. Fish Commission, and after stating that the fish was first described by Prof. Garman, of the Museum of Comparative Zoology, Cambridge, says: "This trout belongs to the group of salmonoids known in Europe as charrs or saiblings, represented in America by a number of species and varieties, most of which inhabit arctic regions. Later authorities have consequently assigned Marston's trout to the genus *Salvelinus*, of which our brook trout (*S. fontinalis*) is the best known example. * * * Marston's trout is known from Lac de Marbre, from which the type came, and from Decallones township, seventy miles east and forty miles north of Montreal. This fish cannot be mistaken for the speckled or brook trout of either sex, except perhaps during the parr stage. It differs markedly in color and form, having among other distinguishing features a plain back, a deeply forked tail and thirteen dorsal and twelve or thirteen anal rays, instead of the ten and nine rays, respectively, of the brook trout." About the time of

the Sportsmen's Show in New York last spring, a gentleman in Canada wrote me that I would probably find at the show in the Quebec exhibit a skin of a red trout (the male Marston trout is almost as red as a breeding male Sunapee saibling), which might prove to be a Marston trout. The skin I easily found, but it was of a common brook trout in breeding colors, so I was disappointed in my quest.

I think, however, that Mr. Chambers has in Quebec a painting of a Marston trout, although that is not what it purports to be. Anyway, it is very like a Marston, although it did not come from waters that are known to contain it, though it may be more widely distributed than is stated in Dr. Evermann's description.

I am yet in hopes to obtain a specimen of this fish to send to Mr. Marston, and would be very glad of the assistance of any Canadian friend who will aid me in the undertaking. I once made a journey of five days in the wilds of Canada in search of a "red trout," only to find at the end of it that the fish was nothing more than our common brook trout, and that it did not have the forked tail which the men said it had before I started on the trail. It was really the forked tail which decided me to make the journey, and when I found the tail of the red trout was square, the men said that was what they meant all the time, although, when I drew a forked tail of a fish on bark before starting, they said that was the shape of the tail of the red trout.

Report from the Restigouche.

Under date of Runnymede, P. Q., June 7, Mr. Mitchell sends me another letter about the salmon fishing in the Restigouche River, Canada, from which I quote in part for the benefit of *FOREST AND STREAM* readers:

"Just a word or two to say that so far we have had a very poor season on the Restigouche. Up to this date a dozen fish are about all that have been killed by all the fly-fishermen on this entire river. They are getting very few in the net, and not over four or five have been taken at the club." (When a good catch of fish is reported from the nets in the tidal portion of the river, the fishermen up the river, at the Restigouche Club and above, expect to find fish in the pools within from two to three days after the run is reported from Campbelltown.) Mr. Mott killed his first fish to-day. Mr. Fairchild got one a few days ago. There are eight rods at Camp Harmony, but not a fish yet. One or two of them are here for the first time, and I hope they will get some fish before long. Archie was fortunate in killing two fine fish on May 31—24½, 24½ lbs. respectively. June 1 I killed one on the Cleveland water weighing 22lbs (the first since I bought the water). The logs are running pretty thick now, and we cannot fish much. Mr. Ayer is expected to arrive Saturday, the 10th. The Alford water is lower now than when you and Mr. Burdick left last year. Thirty-one fish were killed on it in '98, and I hope to kill a few when the logs stop running. I went down to Tide Head yesterday to fish for sea trout, but it was a disagreeable day—cold east wind and occasional showers. Only got five trout, largest 1½lbs. 9 P. M. Archie has just returned from a trouting trip down river with young Mr. Mott. They caught forty-eight trout, weighing 40lbs., and said they had good sport, but the fish are at Dawson's, and I have not seen them yet."

Mr. Fairchild fishes just below Mr. Mitchell's water and just above the Golet water. Mr. Jordan L. Mott, Jr., fishes the Dawson water, where Billy Florence formerly fished, and it is on the opposite side of the river from Fairchild and Golet. Camp Harmony is the Dean Sage water, now added to the Sweeney water, which is opposite the Alford water, owned by Mr. Mitchell. Archie is Mr. Mitchell's son, and a fine salmon fisherman, as would be expected from the son of his father.

A. N. CHENEY.

Newfound Lake.

ASHLAND, N. H., June 10.—*Editor Forest and Stream:* In reply to your correspondent from Newfound Lake, who subscribes Landlocked Salmon House instead of his name, let me say: The facts in this case are that complaints have been made to the Commission for the past three years of certain parties taking salmon in front of the screen with grapple and spear; but we have been unable to secure sufficient evidence to convict until May 11 last. Mr. Wentworth and myself were at Newfound Lake for a day's fishing, when another complaint was made of a party grappling a salmon in front of the screen. Upon investigation the party admitted that he did take a salmon with a grapple in front of the screen, and took it home, dressed it nicely and cooked it. Most people do not cook diseased fish "found lying lengthwise against a screen." From the man's own evidence we were satisfied that it was a case of pure cussedness and fined him as the law directs, and he paid the fine before leaving the room without a murmur.

There seem to be a few people living near this fine lake who are determined to deplete the lake all they can; and by grappling and spearing and fishing the small salmon out of the breeding brooks, they manage to catch hundreds each year, which, if left alone, would materially increase the fishing and save them the trouble of grumbling all the time about poor fishing.

It is a fact that more pounds of salmon and lake trout are taken from this lake each year than from any other body of water in this State of the size, and I might say any one in New England.

There are taken annually from this lake, under direction of the Commission, from 700 to 1,000 parent trout, which produce from 1,000,000 to 1,500,000 eggs, and in no year within my recollection have more than five dead trout been found killed by such treatment; and most of those were either diseased or deformed when taken. But judging from the story of your correspondent, they might be seen in front of the screen at almost any time.

Last year there were planted in the tributaries of this lake 77,000 fine landlocked salmon fry; and this spring large numbers have been seen in the streams, and I am told are being caught by the parties who have been so sorely persecuted by the closing of the waters in front of the screen.

There are, I am happy to say, many residents about the

lake who appreciate what the Commissioners are trying to do for the lake, and they deplore wanton destruction of the food fish by the miserable poachers.

At the request of some of the most prominent citizens about the lake, we closed a small tract of water between the cofferdam and the screen, which we consider we were warranted in doing in the interest of fishing in this lake.

Now if the poachers and grumblers would turn their attention to protecting their fish instead of fishing the streams all day where the salmon fry have been planted and at night carrying their catch home under a lock for fear some one would see the short trout and salmon taken, they would benefit themselves a hundred times more than by the course they are now pursuing.

If the foregoing statement of fact will clear up any of the darkness in the rural district alluded to I am glad; but if it does not, I would advise your correspondent to lay the matter before His Excellency the Governor at once.

F. L. HUGHES,

Sec'y New Hampshire Fish and Game Commission.

CHICAGO AND THE WEST

Chicago Fly-Casting Club.

CHICAGO, Ill., June 10.—About a dozen members of the Chicago Fly-Casting Club met at the North Lagoon, Garfield Park, this afternoon for the third club series of the season. The weather was bright and very fresh, a decided change from the torrid weather which prevailed earlier in the week, and the afternoon was a very enjoyable one. Messrs. Belasco, Greenwood, Hascal, Ludlow, Lippincott, Newkirk, Peet, Renwick, Salter, Smith and Strell took part in the competition, the honorable secretary, Mr. George Murrell, being too busy with the records to take a hand at the floats. A stiffish wind prevailed, which during the fly-casting quartered from left to right across the floats, and during the bait-casting from right to left, the driftage for fly of frog being very noticeable. The wind lessened toward sundown, while the dry-fly work was going on, but was the occasion of a very low set of scores. The club programme is billed to open at 1:30 in the afternoon, but it was somewhat later than that when the work began to-day. In the bait-casting event each man is now required to make three casts at each buoy in the set of five, of fifteen casts in all, and with eleven entries this takes considerable time. It was nearly 7:30 o'clock when the secretary made his announcements, and the cheerful party began to bundle up the rods and set forth for home.

Splendid fellows are these of the Chicago Fly-Casting Club, and they well enough understand the use of the fly rod or the bait rod. These club contests are purely amateur, and are highly enjoyable affairs. To-day a number of ladies were present with their husbands, Mesdames Murrell, Peet, Hascal and Ludlow, these being more or less interested spectators, while the nearly invisible work of the fly went on.

The long-distance fly-casting event was won by F. N. Peet, who had plenty to spare with his fine record of 119ft. Distance and accuracy was won by H. G. Hascal, 89 2-3. Accuracy and delicacy was captured by C. G. Ludlow, 96 1-6, and the bait-casting event was won by H. A. Newkirk, 94 8-15, close crowded by Hascal, who was only 4-15 behind him. The following are the scores of the day:

	Long Distance Fly, Feet.	Distance and Accuracy, Per Cent.	Accuracy and Delicacy, Per Cent.	Bait Casting, Per Cent.
J. D. Belasco...	85	56 2-3	...	61 2-3
H. Greenwood...	89	85 1-3	85 5-6	91 14-15
H. G. Hascal...	109	89 2-3	94 1-6	94 4-15
E. Letterman...	90 8-15
C. Lippincott...	...	86 1-3	95 1-3	85 13-15
C. G. Ludlow...	95	82	96 1-6	89 1-15
H. Newkirk...	...	80 2-3	92 1-3	94 8-15
F. N. Peet...	118	79 1-3	94 5-6	90 8-15
E. A. Renwick...	106	80 1-3	...	82 4-15
G. W. Salter...	...	75 2-3	86 2-3	87 3-5
A. C. Smith...	106	82	93 1-6	88 1-5
G. W. Strell...	73 2-3

Holders of Medals.—Long distance fly, F. N. Peet; distance and accuracy, H. G. Hascal; accuracy and delicacy, C. G. Ludlow; bait-casting, H. A. Newkirk.

Club Fishing Meet.

The fishing meet of the Chicago Fly-Casting Club, held at Bass Lake, Ind., last Saturday, was a very successful little affair, something like two dozen being on hand. They paired off and had a very pleasant time, although the fishing was not very extraordinary. Messrs. Hascal and Smith received the souvenir for the most fortunate pair. Mr. Murrell caught the biggest bass, 3½lbs., and Mr. Goodwin drew the booby prize. Being well pleased with the locality, some of the members contemplate going back again before long, among these Mr. Murrell, who says he has never seen big-mouth bass fight better than they do in that lake.

A Few Bass.

A few bass are being taken by our anglers. Mr. H. W. Perce is now absent on the Fox River on a floating trip from McHenry to Elgin. Mr. E. Wilkinson has been trying the Fox River near Clintonville, and has one or two nice catches. About as good fishing as I have heard of this season for bass has been at Corey Lake, Michigan, where Mr. H. G. Hascal and three friends took 120 bass on their recent trip. At the same water, last week, Mr. H. H. Miner caught thirty bass. These fish averaged small, and many of them were returned. That ought to be a good fly-fishing water, for usually the bass of under a pound weight are the best for fly-fishing.

Trout.

Messrs. Newkirk, Peet, Smith, Hascal, Chadwick and their friend, Mr. Tinthoff, start next week for Michigan for a long session with the rainbow trout.

Mr. F. B. Orr returned last week from his trouting trip at Merrill, Wis., where he had very good fortune and enjoyed the benefits of the first flight of mosquitoes.

Several members of the Gaylord Club will go up next week to try the waters of the Pike and other streams in that very delectable neighborhood.

The old reliable State of Michigan is giving very good account of herself in the way of trout this month. Mr. George L. Alexander, of Grayling, Mich., whom I have often mentioned as president of the Fontinalis Club of that State, writes me under date of June 8 that the Au Sable River is ready and waiting for me to come and tackle it. Mr. Alexander is so very good as to ask me to have a trip with him, and he promises to take me to a place where there are a few grayling, which fish he bids me to speedily attempt, since it will soon be too late forever. I should enjoy nothing more than a few days with Mr. Alexander, who is a prince among anglers, and very skillful withal. Some of these days I will drift into that neck of woods.

One often hears the proverb that it is the busiest men that one should approach if one wants to get anything done. I don't know what I would do if anything should happen to my friend Mr. Merston, of Saginaw, who sends me lots of news, and who sometimes makes me a bit unhappy by telling me of the good times he is going to have, or has been having. It seems that the last trip of the Saginaw crowd (this week) was a very troutful one. Mr. Merston says that everyone had all the fishing he wanted. It was not necessary to keep any small fish, for one day he took thirty-nine, which filled his basket, among these three rainbow trout, one of them 18 in. long. "I lost another," says Mr. Merston, "that seemed to me as long as my arm, and I had a long, hard fight with him. I had two or three brook trout that weighed 1½ lbs. each, and lost a number of old whoppers." Everybody had plenty of trout and everybody was happy. Yet this came pretty near being the end of the Saginaw crowd, which causes one to reflect that there may be some danger in wilderness railroad travel even in the best company. It seems that during the run home there came up a heavy thunderstorm which hustled everybody into the car. The rest of it I shall let Mr. Merston tell for himself:

"The engine immediately started with us," he says, "and we 'slicked up' preparatory for dinner. This was about 9:30 in the evening. It was blowing a hurricane and the rain coming down in barrels full. The engine was running like a scared dog, with only our car and a caboose behind. Suddenly there was a crash, a bumping on the ties and the shock of grinding brake wheels, and we all set our teeth and hung onto our chairs, awaiting with dread the termination. Whether we were to be upside down or when the car would stop was a question. Finally it stopped, right side up, and we were not off the track and apparently all right. But the engine had caught it. A great tree had blown across the track and demolished the cowcatcher and pilot, and derailed the engine. Fortunately we were only four miles from our destination, and managed to get word to another engine, the crew of which on arrival seemed to know just what to do, and we were back on the track in half an hour and caught our train and got home bright and early Monday morning."

That was a near enough thing, but as lightning never strikes twice in the same place, I presume the hardy Saginaw crowd need not expect to meet another fallen tree with their special car at any time soon. Climbing a tree with a locomotive is a feat not desirable of itself nor apt soon to be duplicated.

Muscallunge.

Mr. Marvin Hughitt, Jr., and Mr. Charles Antoine, of this city, returned Monday from a muscallunge trip to the Manitowish Chain. They caught eighteen muscallunge, but most of them were very small, the heaviest 10½ lbs. Upon the other hand, their luck in wall-eyed pike was very remarkable, for Mr. Hughitt was lucky enough to kill one that weighed 11½ lbs., a very extraordinary weight for these waters.

Messrs. C. H. Lester, O. von Lengerke and William Nash left Tuesday evening for Hayward, Mich., where they will spend a week fishing for muscallunge.

There were twenty-two guests last week at Kabekona Camp, Minn., among others Mr. George F. Jennings and son, Dr. McDonald and Mr. J. E. Callahan, all of Chicago. Mr. and Mrs. W. P. Mussey returned yesterday from their trip to Kabekona, after a very pleasant and successful time. I am glad to be able to say that the alarm felt by Mr. McCartney for the future of his fishing resort now proves to be groundless. The Northern Pacific has put back the train which was laid off between Brainerd and Pine River, and the connection is now good throughout, so that one may leave Chicago in the evening and reach the camp the next evening. The temporary withdrawal of the train necessitated a lay-over of twenty-four hours, which bid fair to be fatal to the camp.

Mackinaw Way.

Mr. J. E. Smith, of Caldwell, Ohio, writes me as below for information regarding fishing in the upper part of the South Peninsula:

"I have been reading your articles in the FOREST AND STREAM, and it occurred to me that possibly you would kindly give me information in regard to bass and trout fishing near Mackinac and the Soo, Michigan. I expect to spend three weeks in August near these two points. Any information you can give me will be thankfully received. Was at the Snow Islands last year, but found bass fishing poor."

If Mr. Smith will write to Mr. C. L. Lockwood, general passenger agent of the G. R. & I. Railroad, Grand Rapids, Mich., he will get something better than a railroad answer to his query, for Mr. Lockwood is an angler and knows where the fishing is. For bass fishing near the Soo, he might write to Hon. Chase S. Osborn, ex-game warden, Sault Ste. Marie, Mich. Mr. Osborn is now Railroad Commissioner, but he is still a sportsman, and still lives in Sault Ste. Marie. I think either of these gentlemen would be glad to help out the above inquirer.

The Georgian Bay.

While I was at Cleveland this week I learned of a little party who will take an extended fishing trip this summer in the Georgian Bay country, after muscallunge and bass. There will be two sections of this party, the first leaving June 15, and including Messrs. J. C. Trask, L. A. Roby, D. W. Scribner and H. B. Burrows. About a couple of weeks later these will be joined by Messrs. R. R. Holden, A. S. Brooks, O. F. Clay and C. E. Kennedy.

Castalia Club.

At Cleveland I met among other gentlemen Dr. E. E. Beeman, whose fame is world-wide as the inventor of Beeman's Pepsin Chewing Gum. Dr. Beeman is very much of a sportsman, and is fond of a boat, a gun, a dog and a rod. He is a member of the famous Castalia Club, and through him I heard again of my old friend, Andrew, the club keeper, who it seems has been busy again among the brown trout. The last big fellow taken by Andrew was a grand one, weighing 10 lbs. 8 oz. This fish was brought to Cleveland and served in state. Dr. Beeman told me that it was caught on a 6 oz. rod and on a No. 6 fly hook. The worthy doctor told me that this giant robber of the stream was caught fairly on the artificial fly. "Not that I would affirm, however," he remarked, "that there are no better lures than the artificial fly, far better. Upon the contrary, such is the especial virtue and excellence of the chewing gum manufactured by myself, that in several cases Andrew has manufactured therefrom an artificial worm so alluring that its use has been positively forbidden by the house rules of the club. I need say no more in modest praise of our product than to point out its popularity as an article *pour passer le temps* among even the finny aristocracy."

Carp.

Mr. A. J. Barge, of Cleveland, is another gentleman who is fond of both gun and rod, and he has no use for that imported nuisance, the carp, as food for the rod, though sometimes he has enjoyed very good shooting on them. This spring while duck shooting on the club marsh near Port Clinton, he found the duck feed nearly eaten up by swarms of these carp. He pushed around on the flats and with vindictive zeal shot over 150 of the carp, but seemed to make no impression on their numbers. He says they are ruining the marsh, destroying the celery and the wild rice, and he would cheerfully see the last one of them exterminated.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

The Salt-Water League.

NEW YORK, June 10.—*Editor Forest and Stream:* In the FOREST AND STREAM of May 20 you published a list of delegates up to that date. Since then I have appointed some others. Following are the additional ones, which please add when you publish a full list. I will from time to time send you the new names of those I appoint:

- Branch 35. A. H. Dirkes, Ninth avenue and Fiftieth street.
- Branch 36. Frank Efner, 86 Thompsons avenue, Brooklyn.
- Branch 37. O. M. Beach, 41 Union square.
- Branch 38. Mr. Hesbach, Goose Creek, L. I.
- Branch 39. Fred Hochgraef, 314 East Thirty-fourth street.
- Branch 40. B. Burstel, 17 Riverdale avenue, Yonkers.
- Branch 41. Thos. J. Conroy, 28 John street.
- Branch 42. W. F. Gugler, 315 Bowery.
- Branch 43. Robt. Payton, 251 West Broadway.
- Branch 44. J. A. Schneider, 1512 Broadway.
- Branch 45. C. J. Schukraft, 100 Second avenue.

On Wednesday evening, May 31, a meeting was called by the delegate of Branch No. 1, Mr. Wm. Roeber, at 309 Eighth avenue, and an organization perfected in that district. Meetings to be held on the first and third Wednesdays of each month at the above place to enroll members in the district, also to enlighten members when and where to go to catch fish, what tackle and baits to use, and other points of benefit to members. Headquarters of Branch No. 1 is at 329 Eighth avenue. Information given and taken as to violations of the law, etc. The following officers were elected to office of Branch No. 1 for 1899, and they are hustlers: Mr. Chas. Lorsch, Chairman; Mr. Fred Estz, Vice-Chairman; Mr. Chas. S. Crane, Secretary; Mr. Robt. Cook, Treasurer; Mr. Robt. H. B. Fisher, Sergeant-at-Arms.

We are making great strides in what we have set out to do. That is one good reason why our membership is increasing. More fishing station owners came into our ranks last week. I wish every delegate would organize his district at once and try to beat Branch No. 1.

Fishermen of New York are wanted to join this League. Its purposes as set forth in the constitution are declared to be:

"The objects of this League are, namely, to obtain legislation looking to the enactment of beneficial laws for the protection of salt-water fish, the co-operation of fishermen at large in conforming to and enforcing the same, and generally in furthering and aiding all lawful methods looking to prompt action in all violations of law appertaining thereto.

THEO. BIEDINGER, Pres.

NEW YORK, June 11.—*Editor Forest and Stream:* By request of the president of the League, I herewith send you additional names of delegates, hoping you will publish the same with the others sent you by Mr. Biedinger:

- Branch 43. Schneider, J. A., 1512 Broadway.
- Branch 44. Schukraft, C. J., 100 Second avenue.
- Branch 45. Tobin, C. V., Huguenot, S. I.
- Branch 46. Bjur, Warner, Seaside Dock, Rockaway Beach.
- Branch 47. Cochran, Albert, Tottenville, S. I.
- Branch 48. Mehlhop, W. D., 108 East Twenty-seventh street.
- Branch 49. Schott, Edward, 170 Broadway.
- Branch 50. Selsing, Fred, 27 Carroll street, Brooklyn.

EUGENE THIDNER, Sec'y.

Long Island Fishing.

EAST ROCKAWAY, L. I., June 12.—The net fishermen have done their best to clear the bay of fish, but so far there has been no apparent decrease in the supply. Three gangs of fishermen, each with a net, drag the channels every day. They have been catching from 700 to 1,000 lbs. of fish for each crew. Weakfish predominate. A few kingfish have been caught, and fluke and flounders are plenty. Drop-line fishermen have had fine sport with the weakfish in the bay. The parties who go off to the fishing banks or the wreck of Iberia have come back loaded down with ling, weakfish, etc. Blackfish are still scarce.

QUEENSWATER, L. I., June 12.—The large weakfish have arrived and are caught both in Wreck Lead and in Broad Channel, along Hicks' Beach. There is excellent fishing in the ocean. Bluefish are beginning to arrive, and the professional fishermen prophesy a big run before the season is over. Crabs are becoming plenty, but are not caught much yet, except for bait. They will soon work up into the creeks, where they are captured by the amateur fishermen at the docks and along the creek edge.

MASSAPEQUA, L. I., June 10.—This has been a great week for fishermen. Weakfish have been very plenty and of large size. Some very good catches are reported. Strange to say, they have been caught by rod and reel from the edges of the meadows near the bathing houses of the Massapequa Hotel. Heretofore it has always been thought necessary to take a boat to get weakfish, but some very fine fish have been caught by casting lines from the shore.

Fishing Up and Down the Potomac.

Little Falls.

ABOUT three miles above the Aqueduct, or Free Bridge, at Georgetown, is the Chain Bridge, though there is nothing in the present appearance of the modern iron girder structure to indicate the origin of the name. It is inherited from the first bridge on the same site, long since destroyed.

The path to this is a finely macadamized roadway with the retaining wall of the C. and O. Canal on one side and the Palisades of the Potomac on the other, a delightful ramble or drive in the early dawn of a June morning, when one inhales champagne in the life-giving air and from the river floats a gentle mist, "Like that which kept the heart of Eden green before the useful trouble of the rain."

On the opposite or Virginia shore is an electric light and power house, getting its water from Pimmit Run, which empties into the Potomac just below the bridge.

At the foot of the bluff is a rude path up the river some distance to Little Falls, where tide water meets the Potomac and where begins that famous estuary, the most important of any that marries the Alleghenies to the Atlantic; a hundred miles in length, several miles in average breadth, and a channel to float an iron clad to the Capital.

The falls are well named Little, since they are no more than a rapid, but the current is swift, and the water tumbles in mad confusion, and foams and roars in a way to daunt a novice, but that would be child's play to the skillful voyageur in his birch bark canoe.

Our last trip here was a family affair, and the trip was driven along the Summit road after leaving the bridge, to a point opposite the falls, and a picnic grounds selected on a shady knoll commanding a beautiful view of the river. Here the babies were to be left for the afternoon, while the rods clambered down the steep bluff to try the pools and rapids below.

The knoll was found to be grassy and inviting with wild flowers in plenty, but a closer inspection showed a patch of young poison ivy or poison oak. An immune of the party volunteered to pluck it out by the roots and carry it away. When this was done and blankets spread it was voted safe for the little ones, and they came to no hurt, but the alleged immune several days after found his hands, particularly the tender places between the fingers, covered with irritating vesicles, for which lead water and the ordinary simple remedies afforded no relief, but after a single varnishing with collodion they disappeared.

This recalls the experience of a friend who had been badly poisoned with the vine, and every spring suffered a recurrence of the symptoms, swelling, inflammation and blisters, without fresh exposure. In the fifth year he was induced to try the prescribed homeopathic remedy, rustox as it is called here (*Rhus toxicodendron*), in which he had no faith, but to his surprise was at once relieved, and has never since been troubled though annually exposed.

He still flouts the system of sugar pellets, but takes off his hat to rustox, which he has been often heard to recommend as the only specific. This he stoutly maintains against the suggestion of some of his friends that in his own case he had simply outgrown the effects, and the thorough inoculation had saved him since.

The river at Little Falls narrows to a gorge, and rushes down the long reach a miniature cataract; though the anadromous fishes do surmount the obstruction, they find in the deep pools at its foot a temporary resting place; a relay for the strong, the end of the route for the weak.

As the fish start up for their early spring run, the white perch seem to avoid the shallow water and go straight up the deepest parts of the channel. In this they are unlike the herring and some others which are caught on the banks, but in the hauls for these latter fish very few white perch are caught. The consequence is the perch reach the pools like these at Little Falls, and are caught there in quantities in the deep water, several weeks before they are found in their usual haunts in the coves and shallows, miles below.

Here in the holes below the rapids, the shad and herring and lampreys and mullets and perch are dipped in April and May with long-handled hoop nets, 3 or 4 ft. in diameter, and about as deep; an operation requiring considerable strength and skill.

Occasionally then, a great 6 ft. sturgeon may be seen at play a little distance below, as if he too belonged to this great drove of immigrants, and was rounding up the procession at this natural corral. Leaving the water with a mighty leap he seems to clear two or three times his length and falls upon the surface with a splash as if a plank had been dropped broadside, and with a noise that may be heard across the river.

Even the bass in these estuary waters get the roaming habit, and may be caught under dams and occasionally bump against flood-gates. Within a couple of weeks a little school of 4 lb. big-mouth bass amused a party for several hours on a sunny afternoon. A bridge permitted approach to within 3 ft. of a water gate, and these bass, always in pairs, came up to get through.

Foiled in this they turned tail on the trickle of waste from the gate and rested motionless on the flat rock at the bottom, which had barely enough water running over

it to cover the fish, and there they would stand with just enough motion of the fins to keep their balance, apparently debating whether to make a nest on the spot, seek some new and more favorable locality or go home.

So long as all was quiet they seemed content to rest with only that quiver of the fins, and the bull dog expression that appropriately goes with their pugnacious disposition, but with the flicker of an eyelid or the raising of a finger they were off like a shot, returning only when everything was again still.

Sometimes "snatching," as it is called in Scotland, is practiced at the falls on quite a large scale. A series of triangles are tied to a line a foot apart, and these are dropped in the deep water alongside a steep rock at the foot of the falls. A moment's rest till the fish gather about, and a quick jerk usually engages several herring, and sometimes a better fish. Bushels are caught at times in this way, by pot-fishers who have no net.

Swift water trebles the weight of a fish on the line, and so adds to their apparent fighting qualities that it is a generally accepted theory that the fish which frequents rapids and stony bottoms is far gamer than the fish that lives in a pool; and the argument is plausible enough; that the very exertion of constantly contending with the currents must give the fish a harder nature, a better muscle, a firmer meat, a more decided character; must, in short, make them in every way superior to those which dwell in still waters. Of course, all this is true in a measure, but it is well not to be carried away with the idea to the extent of confining one's fishing to foamy waters, else will the angler sacrifice half the pleasure which is to be had out of his holiday.

Drop a minnow into the rushing waters of the Nepigon and your reel will empty as fast as if there was a salmon on; you get a strike, and tackle which will save a 6lb. bass will hardly get in your 2lb. trout; not because the trout is so far superior, but because the current is strong. Bubbles on the water do not alone give character to fish. The mullet is a mullet still, even under a waterfall; and the pike of the pool is fierce, voracious, cunning, athletic and unconquerable. He comes with a rush and a snap, sometimes for yards on the surface of the water; hits the fly with a certainty that leaves nothing to be desired, and does acrobatic stunts all the way to the net, if he does not get off before, which he is like enough to do.

He is a mighty hunter, and his method of pursuing his prey keeps him always fit. There are some anglers who consider there is but one black bass, the small-mouth, and that the other is useless for food, lacking in gamey qualities and only fished for by the misguided. In this they are mistaken, and it is a theory they will abandon and resent when their experience is wider.

It is possible that in the Florida lakes they may be tame sport, and there seems to be a general agreement that in some of the swamps of Ohio the big-mouth is an inferior fish, but there is yet to be found his superior where he has a fair chance.

His open countenance enables him to feed on 1/2 lb. fish and over, and the exercise he gets in running these down keeps him in the pink of condition the season through. He is called the "jumper" in Kentucky, and the Fish Commission tell of one in the Holston River, Tenn., clearing a 12ft. barge with a 14ft. leap; there is a well authenticated instance of an 11ft. jump made by a hooked bass in a pool on the lower Potomac.

Taking the two fish at their best, there is no man living can tell the difference in their taking the fly, in their fight to the boat, or on the platter, by any other sign than that one has a more capacious smile than the other; and by the same token he is just a little the better jumper and will leave the water oftener after being hooked, and is as long in coming to the net as his cousin who says "prunes."

Granby and Dewar are revising a new edition of the "Haddon Hall Library of Sports," and the first volume, just out, is a reprint of Sir Edward Grey's "Fly-Fishing," an interesting sketch of his experiences and delights with the dry fly. He has an ingenious theory that when a trout runs to the weeds he does not roll himself up in them, as some anglers contend, but just lays hold of the stems with his mouth and hangs on; this accounts, he thinks, for the dead pull one has when the trout reaches the brush, and he mentions several instances to prove this, where the patch of weeds was too small to hide his fish, and he could see it all the time; and of frequently catching them with pieces of weed in the mouth.

This is clever and interesting, but will require something more of demonstration to be universally accepted.

C. A. Munger in the Knickerbocker for 1855, told of similar devices by the intelligent fish of the Susquehanna.

"It may be some large fish hath taken your bait, and run under a stone. If so, he will come shortly out and you shall lose nothing but time, for which the Susquehanna angler careth not a fig. Some there be who say that this river aboundeth with a very large and strong fish, which taketh great delight in pestering the honest fisher, by seizing the line between his teeth and curling his tail around a root or stick and holding there until the twine be broken. * * *

"Yet if it be not true, it is but a harmless bit of pleasantry which is allowable to our gentle craft; though no Susquehanna angler will tell large stories, much less lie." HENRY TALBOTT.

Proposed Texas Trials.

MR. ROBT. W. SHAW, of Galveston, Tex., has undertaken to promote field trials in his State. In a recent letter to Texas sportsmen he says:

It is generally conceded that field trials have been a strong factor in the improvement of the bird dog; in fact, it is the only means to make the improvement general, for public competitions bring to the front dogs of force and individuality, suggesting the best to breed to and the most desirable blood lines to perpetuate, and afford opportunities of seeing typical specimens of both breeds in an exhibition of high class field work.

State field trial associations have proven a success in other States. Can we not make one a success in Texas? We have as good dogs as may be found elsewhere, and surely we have as keen sportsmen, fully abreast with all that pertains to dog and gun; refined and cultured people form the nucleus of true sportsmanship the world over, and we know the craft is clean here and elsewhere.

I am reasonably sure a field trial association would prove a success, and I believe these conditions would insure it: Make the initiation and entry fees light, thus making the cost of membership inexpensive. The membership should be large so that the interest may be general, and to avoid all local jealousies and in the interest of harmony, I think it would be well to change the location of the running grounds annually. This would be practicable, as there are so many portions of Texas eligible and available.

I suggest that an organization meeting be held in the city of Dallas early in July, and that the local sportsmen of every county in the State get together and accredit a delegate to attend the Dallas meeting and submit a list of names for membership, elect officers, adopt by-laws and running rules, and decide on a point to hold the first field trials.

I shall be pleased to hear from you and will thank you for any suggestion that may favor the object in view.

ROBT. W. SHAW.

Yachting.

Fixtures.

JUNE.

- 12-13-14. Royal St. Lawrence, Yankee-Dominion match, Dorval, Lake St. Louis.
14. East Gloucester, cup, Gloucester, Mass.
15. Portland, cruise, Portland, Me.
17. Larchmont, spring open, Larchmont, Long Island Sound.
17. Morris Yachtsmen, spring open, City Island, Pelham Bay.
17. Winthrop, squadron cruise to Nahant, Massachusetts Bay.
17. Taunton, club, Taunton.
17. Gravesend Bay, annual, Bath Beach, New York Bay.
17. Hull, Mass., annual, open.
17. Beverly, open, Monument Beach, Buzzard's Bay.
17. Jubilee, open, 2d cham.
17. Jamaica Bay, dory class, Jamaica Bay.
17. American, club, Newburyport, Mass.
17. Philadelphia, annual, Philadelphia, Delaware River.
17. East Gloucester, club, Gloucester, Mass.
17. Plymouth, club, Plymouth, Mass.
17. Quannapowitt, club.
17. Corinthian Mar., club, Marblehead, Massachusetts Bay.
17. Jeffries, cruise, East Boston, Boston Harbor.
17. Royal Nova Scotia, club, Halifax, N. S.
18. Penataquit Cor., snipe class, Bayshore, L. I.
18. Gloucester, spring, Delaware River.
18. Old Mill, club, Jamaica Bay.
19. Brooklyn, annual, open, Bath Beach, New York Bay.
19. Pavana, annual, open, Communipaw, New York Bay.
20. Atlantic, annual, open, Sea Gate, New York Harbor.
21. Royal Nova Scotia, open, Halifax, N. S.
21. East Gloucester, cup, Gloucester, Mass.
22. New York, annual, open, New York, New York Harbor.
22. Boston, club handicap, South Boston, Boston Harbor.
24. Norwalk, club, Norwalk, Conn., Long Island Sound.
24. Corinthian, Phila., knockabout, Essington, Delaware River.
24. West End, club, Detroit, Lake St. Clair.
24. Beverly, club Cor., Monument Beach, Buzzard's Bay.
24. Royal Nova Scotia, knockabout class, Halifax, N. S.
24. Seawanhaka Cor., annual, open, Oyster Bay, L. I. Sound.
24. Winthrop, club, Great Head, Boston Harbor.
24. Morris Yachtsmen, special, City Island, Long Island Sound.
24. Burgess, 2d cham., Marblehead, Massachusetts Bay.
24. Jamaica Bay, club, cats, Jamaica Bay.
25. Penataquit Cor., club, Bayshore, Great South Bay.
- 26-29. Sea. Cor., cruise to New London and return, L. I. Sound.
28. Mosquito Fleet, open, South Boston, Boston Harbor.
28. East Gloucester, cup, Gloucester, Mass.

JULY.

1. Wood's Holl, sprit and cat class, Quissett.
1. Quincy, club, Quincy, Boston Harbor.
1. Eastern, annual, Marblehead, Massachusetts Bay.
1. American, annual cruise, Newburyport to Boston.
1. New Rochelle, annual, open, New Rochelle, L. I. Sound.
1. Columbia-Defender, New York, New York Harbor.
1. New Jersey-Knickerbocker, cup, Bayonne, Newark Bay.
1. Beverly, Cor., Monument Beach, Buzzard's Bay.
1. Burgess, club, Marblehead, Massachusetts Bay.
- 1-4. Williamsburgh, an. cruise to Cold Spg. Harbor, L. I. Sound.
1. Winthrop, hand sweeps, Winthrop, Boston Harbor.
1. Savin Hill, open, Savin Hill, Boston Harbor.
1. Corinthian, Phila., knockabouts, Essington, Delaware River.
2. Penataquit Cor., snipe class, Bayshore, Great South Bay.
3. Stamford, annual, open.
- 3-5-6. Seawanhaka Cor., 20ft. trials, Oyster Bay, L. I. Sound.
2. Atlantic, cruise, rendezvous at Larchmont; 5, Larchmont to Black Rock, Black Rock to New London; 7, New London to Shelter Island.
- 4-5-6. Chicago, trial races, Canada cup, Chicago, Lake Michigan.
4. Larchmont, annual, open, Larchmont, Long Island Sound.
4. Boston City, open, South Boston, Boston Harbor.
4. Corinthian, Marblehead, club cham., Marblehead, Mass. Bay.
4. Wollaston, Burgess cup, Wollaston, Mass.
4. East Gloucester, club, Gloucester, Mass.
4. Pavana, club special, Communipaw, New York Bay.
4. Newport, annual, Newport, Narragansett Bay.
4. Jamaica Bay, club, Jamaica Bay.
4. Quannapowitt, club.
4. Wood's Holl, sprit & cat classes, Wood's Holl, Hadley Harbor.
5. American, annual, open, Milton Point, Long Island Sound.
5. East Gloucester, club, Gloucester, Mass.
6. Indian Harbor, special, Greenwich, Long Island Sound.
7. Sea Cliff, open, Sea Cliff, Long Island Sound.
8. Riverside, annual, open, Riverside, Long Island Sound.
8. Jamaica Bay, dory class, Jamaica Bay.
8. Corinthian, Phila., knockabouts, Essington, Delaware River.
8. Royal Nova Scotia, open, Halifax, N. S.
8. Burgess, club, Marblehead, Massachusetts Bay.
8. Winthrop, club, Winthrop, Boston Harbor.
8. Wood's Holl, open, Quissett.
8. Norwalk, club, Norwalk, Long Island Sound.
9. Penataquit Cor., 15ft. class, Bayshore, Great South Bay.
10. Manchester, 1st cham., Manchester.
12. East Gloucester, cup, Gloucester, Mass.
- 15-17-18-19-20-21. Larchmont, race week.
15. Penataquit Cor., snipe class, Bayshore, Great South Bay.
15. American, handicap, Newburyport, Mass.
15. Beverly, club Cor., Monument Beach, Buzzard's Bay.
15. East Gloucester, cruise, Gloucester, Mass.
15. Wollaston, ladies' day, Wollaston, Mass.
15. Quincy, open, Quincy, Boston Harbor.
15. Winthrop, hand sweeps, Winthrop, Boston Harbor.
16. Corinthian, Marblehead, 3d cham., Marblehead, Mass. Bay.

15. Taunton, club, Taunton, Mass.
15. Jamaica Bay, club special, Jamaica Bay.
15. Royal Nova Scotia, all classes, Halifax, N. S.
15. Corinthian, Phila., knockabouts, Essington, Delaware River.
15. Wood's Holl, sprit and cat classes, Wood's Holl.
15. Savin Hill, club handicap, Savin Hill, Boston Harbor.
15. Burgess, 16ft. class, Marblehead, Massachusetts Bay.
15. Seawanhaka Cor., Roosevelt cup, Oyster Bay, L. I. Sound.
15. Quannapowitt, club.
16. East Gloucester, cruise to Marblehead.
16. Williamsburgh, club, cats, Long Island Sound.
16. Old Mill, open.
16. Squantum, Burkhardt cup, Squantum, Mass.
16. Penataquit, annual, club, Bayshore, Great South Bay.
17. Manchester, 1st cham., West Manchester.
17. Quincy, ladies' day, Quincy, Boston Harbor.
18. Newport, ladies' day, Newport, Narragansett Bay.
18. East Gloucester, cup, Gloucester, Mass.
21. Wollaston, moonlight sail, Wollaston, Mass.
21. Taunton, club run, Taunton, Mass.
22. Burgess, open, Marblehead, Massachusetts Bay.
22. Corinthian, Phila., knockabouts, Essington, Delaware River.
22. Wood's Holl, sprit & cat classes, Wood's Holl, Hadley Harbor.
22. Jamaica Bay, dory class, Jamaica Bay.
22. New Jersey-Knickerbocker, cup, Bayonne, Newark Bay.
22. Penataquit Cor., 15ft. class, Bayshore, Great South Bay.
22. Quannapowitt, club.
22. Penataquit Cor., snipe class, Bayshore, Great South Bay.
- 24-29. Oconomowoc, race week, Oconomowoc Lake.
- 24-25-26. Quincy, challenge cup, Quincy, Boston Harbor.
24. Manchester, 2d cham., Manchester.
24. American, moonlight sail, Newburyport.
26. East Gloucester, cup, Gloucester, Mass.
- 26-27-28-29. Beverly, race week, Buzzard's Bay.
- 26-27-28. Royal St. Lawrence, Seawanhaka cup, Dorval, Lake St. Louis.
27. Jamaica Bay, cat classes, Jamaica Bay.
29. New Jersey-Knickerbocker, Ellsworth cup, Bayonne, Newark Bay.
29. Plymouth, club, Plymouth, Mass.
29. Royal Nova Scotia, one-design, Halifax, N. S.
29. Norwalk, club, Norwalk, Long Island Sound.
29. American, club handicap, Newburyport.
29. Winthrop, open, Winthrop, Boston Harbor.
29. Indian Harbor, annual, open, Greenwich, Long Island Sound.
29. Corinthian, Marblehead, 4th cham., Marblehead, Mass. Bay.
29. Quannapowitt, club.
30. Penataquit Cor., 15ft. class, Bayshore, Great South Bay.
31. Wood's Holl, open, Quissett.
31. Manchester, 3d cham., Manchester, Mass.
30. Lake Champlain, annual cruise, rendezvous Port Henry, Lake Champlain.

AUGUST.

- July 30 to Aug. 8. Lake Champlain, annual cruise, L. Champlain.
1. Wood's Holl, club, Wood's Holl.
2. Royal Nova Scotia, squadron cruise, Halifax, N. S.
2. East Gloucester, cup, Gloucester, Mass.
- 3-4-5-7-8. Manchester, midsummer races, Manchester.
5. Beverly, Cor. race., Monument Beach, Buzzard's Bay.
5. Burgess, Marblehead, Massachusetts Bay.
5. East Gloucester, club, Gloucester, Mass.
5. Hempstead Harbor, annual, open, Glen Cove, L. I. Sound.
5. Jamaica Bay, dory class, Jamaica Bay.
5. Sea Cliff, annual, open, Long Island Sound.
7. New York, annual cruise, rendezvous.
- 7-8-9. Royal Canadian, Canada cup trials, Toronto, Lake Ontario.
7. Knickerbocker, annual cruise, rendezvous College Point.
- 9-10-11. Corinthian, Marblehead, midsummer series, Marblehead, Massachusetts Bay.
12. Corinthian, Marblehead, open, Marblehead, Massachusetts Bay.
12. Horseshoe Harbor, annual, open, Larchmont, L. I. Sound.
12. American, cruise to Squam, Newburyport.
12. Quincy, club, Quincy, Boston Harbor.
12. Taunton, club, Taunton, Mass.
12. Wood's Holl, open, Wood's Holl, Quissett.
12. Wollaston, open, Wollaston, Mass.
12. Bridgeport, Bridgeport, Long Island Sound.
12. Royal Nova Scotia, one-design class, Halifax, N. S.
12. Norwalk, club, Norwalk, Long Island Sound.
12. Quannapowitt, club.
12. Squantum, handicap, Squantum, Mass.
12. Jamaica Bay, annual cruise, rendezvous.
- 12-13. Winthrop, cruise to Marblehead, Winthrop.
12. Savin Hill, club handicap, Savin Hill, Boston Harbor.
12. Penataquit Cor., 15ft. class, Bayshore, Great South Bay.
13. Williamsburgh, sloop classes, Bowers Bay, L. I. Sound.
- 14-15-16-17. Lake Y. R. A. meet, Toronto, Lake Ontario.
- 14 to 19. Oshkosh, J. L. Y. A. week, Oshkosh, Wis.
- 14-15-16. Erie, open, Erie, Pa., Lake Erie.
14. American, open, Newburyport.
16. Annisquam, open, Annisquam.
17. Newport, ladies' day, Newport, Narragansett Bay.
17. East Gloucester, open, Gloucester, Mass.
17. Taunton, ladies' day, Taunton, Mass.
19. Corinthian, Marblehead, 5th cham., Marblehead, Mass. Bay.
19. Beverly, club Cor., Monument Beach, Buzzard's Bay.
19. Burgess, club, Marblehead, Massachusetts Bay.
19. Jubilee, annual, open, Salem Bay.
19. Huguenot, annual, open, New Rochelle, Long Island Sound.
19. Morris, special club, Port Morris, Long Island Sound.
19. New Jersey-Knickerbocker, Cor. cup, Bayonne, Newark Bay.
19. Royal Hamilton, open., Hamilton, Lake Ontario.
19. Royal Nova Scotia, all classes, Halifax, N. S.
19. Quannapowitt, club.
19. Philadelphia, cup, Philadelphia, Delaware River.
20. Penataquit Cor., snipe class, Bayshore, Great South Bay.
21. Royal Canadian, Canada cup, Toronto, Lake Ontario.
- 21-22-23-24-25. Seawanhaka Cor., Cor. of Philadelphia, knockabout match, Oyster Bay, Long Island Sound.
21. American, moonlight sail, Newburyport, Mass.
24. Plymouth, open, Plymouth, Mass.
25. Kingston, open, Duxbury Bay.
26. Royal Nova Scotia, club, Halifax, N. S.
26. Jamaica Bay, dory class, Jamaica Bay.
26. Huntington, annual, open, Huntington Bay.
26. Manhasset, special, Port Washington, Long Island Sound.
26. Beverly, open, Monument Beach, Buzzard's Bay.
26. Corinthian, Marblehead, 6th cham., Marblehead, Mass. Bay.
26. Duxbury, open, Duxbury Bay.
26. Burgess, club, Marblehead, Massachusetts Bay.
26. Quincy, club, Quincy, Boston Harbor.
26. Seawanhaka Cor., Center memorial, Oyster Bay, L. I. Sound.
26. Winthrop, club, Winthrop, Boston Harbor.
26. Wollaston, handicap, Wollaston, Mass.
26. Quannapowitt, club.
26. Wood's Holl, sprit & cat classes, Wood's Holl, Hadley Harbor.
26. Norwalk, club, Norwalk, Long Island Sound.
26. Savin Hill, club handicap, Savin Hill, Boston Harbor.
26. Atlantic, Ballantine cup, Sea Gate, New York Harbor.
27. Williamsburgh, ladies' race, Bowers Bay, Long Island Sound.
27. Penataquit Cor., knockabouts, Bayshore, Great South Bay.
28. Cape Cod, open, Provincetown, Cape Cod Bay.
29. Wellfleet, open, Wellfleet Harbor.

SEPTEMBER.

- New York, trial races, America cup, off Sandy Hook.
2. Larchmont, special races, Larchmont, Long Island Sound.
2. Jamaica Bay, dory class, Jamaica Bay.
2. Beverly, open, Monument Beach, Buzzard's Bay.
- 2-4. Corinthian, cruise, Philadelphia, Delaware River.
2. Philadelphia, cup, Philadelphia, Delaware River.
2. Wood's Holl, club.
- 2-4. Wollaston, cruise, Wollaston.
2. Indian Harbor, special, Greenwich, Long Island Sound.
- 2-4. East Gloucester, cruise to Hull.
2. Royal Nova Scotia, one-design class, Halifax, N. S.
2. Penataquit, fall club regatta, Bayshore, Great South Bay.
4. Larchmont, fall regatta, Larchmont, Long Island Sound.
4. Atlantic, Adams cups, Sea Gate, New York Harbor.
4. Beverly, open, Monument Beach, Buzzard's Bay.
4. Bunker Hill, annual, Boston Harbor.
4. Lynn, annual, open, Nahant, Massachusetts Bay.
4. Newport, club, Newport, Narragansett Bay.
4. Wood's Holl, sprit & cat classes, Wood's Holl, Hadley Harbor.
4. Burgess, club, Marblehead, Massachusetts Bay.
4. Sachem's Head, annual, open, Sachem's Head, L. I. Sound.
4. Pavana, special club, Communipaw, New York Bay.
4. Royal Nova Scotia, Prince of Wales cup, Halifax, N. S.
4. Norwalk, open, Norwalk, Long Island Sound.
- 7 to 11. Interlake Y. R. A. meet, Put-in-Bay, Lake Erie.
9. Royal Nova Scotia, open handicap, Halifax, N. S.
9. Atlantic, Gould cups, Sea Gate, New York Bay.
9. Seawanhaka Cor., fall race, Oyster Bay, Long Island Sound.
9. Larchmont, special, Larchmont, Long Island Sound.
9. Hull, Mass., open, Hull, Boston Harbor.

23. Riverside, fall regatta, Riverside, Long Island Sound.
24. Williamsburgh, annual fall regatta, Bowery Bay, L. I. Sound.
27. Taunton, ladies' day, Taunton, Mass.
30. Corinthian, knockabout, Essington, Delaware River.

OCTOBER.

3-5-7. New York, America Cup matches, Sandy Hook.

NOTHING definite is yet known as to the date of Shamrock's launching, but it will probably be about July 1. A statement is current that Britannia, now refitting at Cowes, will sail a series of trial races with her; but this is uncertain, and she will probably come to this country an untried boat.

Columbia.

THE Cup defender Columbia was successfully launched on the date announced, June 10, at 8:15 P. M. During the week everyone about the shops was busy finishing up the innumerable odds and ends of work. The deck was completed, the topsides were painted white, and the steel plate forming the archboard was fitted and riveted. On Friday morning men were set to work to remove a part of the water end of the south shop, to give room for the yacht to pass out. By mistake much more of the partition was removed than was intended, disclosing the after body of the yacht to the newspaper men and others on the look-out in rowboats. In a very short time all the lower portion of the partition was replaced, hiding the yacht. This incident gave rise to the report that the launch would take place at once, a day sooner than announced.

Saturday was clear and pleasant, an ideal June day. The newspaper men and photographers were in force all day, though all access to the shop was as closely guarded by watchmen as when the yacht was just in frame. During the afternoon the crowd began to gather, coming by train from Providence until the numbers ran up to thousands. Off the works were anchored the yachts Defender, Quissetta, Priscilla, Queen Mab, Vergana, Sultana, Electra, Marietta, Carmita, Ligeuner, Scythian, Felicia, Narada and Velthra. The steamer St. Michaels lay alongside the Herreshoff pier. The torpedo boat Morris came up from Newport at dusk and created much confusion among the numerous rowboats grouped closely about the south shop. The south pier was closed, except to friends of the Herreshoffs, but the north pier was open to all who could find a foothold on it.

Within the shop Mr. and Mrs. Iselin stood on the launching platform near the bow, while N. G. Herreshoff, Capt. Barr and some of the crew were on the deck of the yacht, whose bows were draped with garlands of flowers. At 8:15 the cradle was started slowly down the ways by means of the engine and windlass, Mrs. Iselin breaking the bottle over the yacht's bow and christening her Columbia. The progress of the boat was slow but steady. As the counter, with the name in gold letters, emerged from the end of the shop, the crew set up a flag-pole with a silk ensign. As the middle of the deck cleared the shop a second pole with the private signals of Com. Morgan and Mr. Iselin was set up, and finally the New York Y. C. burgee was placed on the bow. Within about five minutes from the start the yacht was afloat, and she was soon warped in and made fast to the pier. During the progress down the ways a calcium light was burning brightly on board the St. Michaels, and other lights were thrown on the yacht, so that her form could be seen to good advantage. It shows all the characteristics ascribed to it—a round bilge, great hollow below, very thin and deep fin, and easy fore-and-aft lines. The dimensions, according to the most reliable reports, are: Length over all, 131 ft.; l.w.l., 90 ft.; beam, 24 ft. 2 in.; draft, 20 ft. To keep within the 90 ft. l.w.l. limit, the yacht will be sailed at a little under 20 ft. draft.

The launch was marred only by an accident, for which those connected with the yacht were not responsible. A couple of photographers had prepaed a quantity of magnesium powder on a slide of the coal shed on the north wharf. Several boys had dropped to the slide unknown to the photographers, and when the powder was exploded one of them, Napoleon Sans Souci, nine years old, was killed, while two others had their legs broken and a man was injured.

The yacht will be fitted out as rapidly as possible, and it is expected that she will be ready to race with Defender within the next two weeks. Defender will be hauled up as far as her spars will permit on the Herreshoff railway, and will be cleaned below water.

Corinthian Y. C. of San Francisco.

SAN FRANCISCO.

Tuesday, May 30.

THE Corinthian Y. C. of San Francisco sailed a race on May 30 in a strong breeze, the course being from a line off Meiggs' Wharf around Presidio Shoal Buoy, thence around Blossom Rock Buoy, thence around a stake boat off Southampton Shoal, then to and around Presidio Buoy, and across the starting line. The times were:

	Elapsed.	Corrected.
*Speedwell	3 08 40
36ft. Class.		
†Harpoon	2 55 55	2 55 55
Emma	3 15 50	3 12 22
Edna	3 14 00	3 12 51

*Witch	3 33 00
*Sail over.	†Disqualified.

Witch, the only starter in the 20ft. class, was sailed by the young son of Mr. Will Brooks, with a crew of boys.

Douglaston Y. C. Annual Regatta.

PORT WASHINGTON—LONG ISLAND SOUND.

Saturday, June 10.

THE Douglaston Y. C. sailed its annual regatta on June 10 from the new station on Manhasset Bay, the light weather in the morning cutting down the list of starters. It was not until 2:33 P. M. that the start was made, a moderate southerly wind having come up shortly before. In consequence of the late hour, the larger yachts were sent over a twelve-mile course, from the club station around the Gangway Buoy and the spar buoy on Execution Reef, the smaller ones sailing a seven-mile course, around the Gangway Buoy and home. Once started, the race was sailed in a moderate breeze throughout, shifting S.W. during the latter part. The times were:

Cutters and Sloops—43ft. Class—Start, 2:38.	Length.	Elapsed.

Burgess Y. C. First Championship.

MARBLEHEAD—MASSACHUSETTS BAY.

Saturday, June 10.

THE Burgess Y. C. sailed its first championship race on June 10 in a moderate south wind. Among the starters were four new boats, the raceabouts Peep, Persimmon and Pyrate, and the 16-footer Cyclone. Peep led her class to the outer mark, but mistook the course, heading for Half-Way Rock instead of Cat Island. When the error was discovered it was too late to regain the lost ground, and she withdrew. The times were:

The South Boston Clubs.

GREAT changes have come about within the last year or so in the conditions at City Point, and the quarters of the yachtsmen there are entirely different affairs from the old buildings which they occupied. Handsome new homes have been constructed by the South Boston, Columbia and Boston Yacht Clubs and the Puritan Canoe Club, and everything there is now as well arranged for small craft as could be desired. In the first place the dredging and the construction of the Strandway have given the yachtsmen a depth of water which they never had in old times, and there is no more of the wading ashore through the mud flats which was so unpleasant a feature of yachting at City Point. There is now 6 ft. of water at low tide at the floats of all the club houses, and the rubbish-strewn beach has given place to a neat granite wall, in front of which floats are moored and on top of which the club houses are situated.

At the end of the row of club houses toward the point stands the house of the South Boston Y. C. Next to it will be that of the Columbia Y. C., which is in the process of construction and may be finished some time in July. It is a square three-story structure, with a large piazza running along the water front, from which steps and a run lead down to the float. The entrance to the building opens into a circular staircase hall and reception room 18 ft. in diameter, and from this hall all the public rooms of the building, the ladies' room, committee room, smoking and recreation room and dance hall may be reached without entering that part of the building which is devoted to the lockers.

On the second floor are the smoking and recreation room and the ladies' room, both of which open on to the water front of the building. Above these is the dance hall, which takes up all the space under the roof with the exception of that set apart for lockers, being 34 by 30 ft., with a clear height of 10 ft. at the lowest point. There are forty lockers in the building, each 6 by 9 ft., besides some additional store closets which can be used for lockers.

A little further along, opposite the foot of O street, is the house of the Puritan C. C., which was recently completed. It is a less pretentious building than the yacht club houses as regards size, but it is slightly from the outside and well planned inside. It has a frontage of 42 ft. and a depth of 37 ft. The whole of the first floor is occupied by lockers and canoe racks, and on the second floor are the committee rooms and storage apartments, besides a good-sized meeting room, prettily furnished.

At the end of the line nearest the city is the house of the Boston Y. C. This has been in commission for more than a year, and everything there is now in good shape and running smoothly.—Boston Transcript.

Yankee—Dominion Match.

DORVAL—LAKE ST. LOUIS.

THE White Bear champion, Yankee, after a long trip by rail, arrived at Lachine on June 6 and was launched at the Dominion Bridge Company's works. On June 8 Mr. P. C. Store, general manager of the Chicago & Great Western Railway, arrived at Dorval in his private car, accompanied by Messrs. C. W. Griggs, H. T. Drake and J. P. Ordway, ex-commandores of the White Bear Y. C.; J. W. Taylor, commodore of the Inland Lake Yachting Association; F. M. Douglas, T. L. Wann and W. S. Morton. The races began on Monday, June 12, the courses and general arrangements being the same as in the Seawanhaka cup races of previous years. The steamer Duchess of York will follow the yachts.

The first race was sailed on June 12, the course being two miles to windward and return, sailed three times. There was no wind early in the day, but at 2 o'clock the breeze came in from S.W. light at first, but freshening until it kicked up quite a sea. The crews were:

Yankee.—L. P. Ordway, Capt.; F. W. Douglas, J. E. Ramelay and C. M. Griggs.

Dominion.—G. H. Duggan, Capt.; F. P. Shearwood, W. A. C. Hamilton and G. D. Boulton.

Dominion crossed first, about 7s. ahead of Yankee, and gained from the start, being 2m. ahead at the windward mark. On the run down Yankee gained 33s., but at the weather mark on the second round Dominion was 4m. 59s. ahead, having shown to much greater advantage as the water grew rougher. She finished the round with a lead of 5m. 27s. The wind fell and also shifted on the last round, to make a reach out and in, Yankee showing to much better advantage, though Dominion still had a lead of 4m. 55s. at the outer mark. The last leg was almost a drift, and Dominion gained so that she finally won by 9m. 58s.

The Canada Cup.

THE 35-footer Prairie was launched at Ogdensburg on June 2, and on June 6 she started for Chicago. Mr. C. H. Thorne purchased the steam yacht Vailima of Mr. W. H. Post, of Ogdensburg, as a tender for Prairie, to tow her to Chicago. The two called at Charlotte for coal on June 7, and on June 9 they reached Port Dalhousie and entered the Welland Canal.

On June 3 the Fearnside fin-keel 35-footer was launched at Hamilton, being named Hamilton. The Duggan 35-footer was launched at Hodson's shops, Toronto, on June 5. She was built in a second-story loft and had to be lowered into the water, which was successfully done. She was named Toronto. The work of rigging will go ahead rapidly, the ironwork and hollow spars having been already prepared under Mr. Duggan's direction at Dorval. Her crew includes J. Wilson Morse, as skipper; George E. Evans, Gordon Crawford, J. H. McMurray, J. W. Gale and Harry Johnston. The McLeod boat is nearly ready for launching at Andrews' yard, Oakville, and the Payne boat is well under way.

The Rochester yacht Genesee will be under command of J. E. Burroughs, with Wm. J. Graham, Chas. Van Voorhis, M. A. McDuff, James McDonnell and Alexander McDonnell as crew. Her sails arrived on June 5 from Wilson & Silsby. The fin-keel Verona, of Hamilton, has been purchased by F. E. Rogers, and will be used for tuning up Genesee. She arrived at Charlotte on June 7. A trial was arranged on June 7 between Genesee and the old 52-footer Cinderella, now owned at Charlotte, but the later carried away her topmast.

Defender.

ON June 3 Defender left the Bristol Works at 3:30 P. M. and sailed down to Newport, anchoring in Brenton's Cove at 6 o'clock. Mr. W. Butler Duncan, Jr., who will have charge of her through the season, was on board, with Capt. Rhodes. Nothing was done on Sunday, but early on Monday morning the crew was at work, and at 11 o'clock the yacht was under way, the lower sails being set. With a fresh breeze she ran up Narragansett Bay as far as Prudence Island and returned to her anchorage in the Cove. On Tuesday morning she was again under way, standing out to sea with a light breeze and meeting more wind and a ground swell outside. Just before noon, when outside Brenton's Reef Lightship the club topsail was sent up, but when nearly home the whip of the halyards parted and dropped the big club a distance of about 100 ft. It tore and passed through the mainsail and struck the deck on the port side about 20 ft. abaft the mast, the end passing through the jib, planking and bringing up finally against the bottom plating, which was not seriously injured. The spar passed through the galley and officers' mess room. It was found necessary to saw off the spar, after which the wreckage was soon cleared, the torn mainsail lowered, and the yacht was put before the wind under her headsails, running past Newport and on to Bristol. On her arrival half a dozen sailmakers went aboard and set to work at the mainail, while the hole in the deck was patched temporarily. She left Bristol on Wednesday at 8 o'clock and sailed out of the bay and nearly to Block Island in a fresh S.E. breeze and sea. The new steel mast has stood well thus far, and promises to be a success, while the sails are in good shape and the yacht working satisfactorily. She sailed up to Bristol on Saturday and was present at the launch of Columbia.

Mr. Duncan is now living at Newport, and the yacht will be sailed every day. As soon as Columbia is ready the two will be tried together.

Wollaston Y. C., Burgess Cup Race.

WOLLASTON, MASS.

Saturday, June 10.

THE first race of the Wollaston Y. C. for the Burgess cup was sailed on June 10, the times being:

	Length.	Elapsed.	Corrected.
Muriel, J. L. Smith.....	15.01	2 22 05	1 49 05
Edna, Charles F. Marr.....	15.07	2 33 55	2 01 29
West Wind, W. M. Chase.....	16.01	Did not finish.	
Dictator, W. J. Coombs.....	16.10	Withdrew.	
Mable, L. Lewis.....	15.00	Withdrew.	

Winthrop Y. C. Handicap Race.

WINTHROP—BOSTON HARBOR.

Saturday, June 10.

THE Winthrop Y. C. sailed a handicap race on June 10 in a light east wind, the times being:

	Corrected.
Alma, C. A. Heney.....	0 47 15
Alert, John MacConnell, Jr.....	0 49 27
Hermes, A. W. Chesterton.....	0 51 40

Idalia.

THE steel steam yacht designed by Gardner & Cox, of New York, and built at Roach's yard, Chester, was launched on June 10, being christened Idalia for five-year-old Miss Sara S. Long. The yacht replaces Illawarra, sold to the Government last year, and is 186 ft. over all, 140 ft. l.w.l., 20 ft. beam and 12 ft. 10 in. depth, with engines 12½, 20, 22 and 23 by 18 in. She is very completely and elegantly finished throughout.

YACHTING NEWS NOTES.

The fifty-third annual regatta of the New York Y. C. will be sailed on Thursday, June 22, over the regular courses, starting off Buoy 13, at 11 A. M. The regular prizes in each class will be a \$200 cup for first, if two or more start, and a \$75 cup for second, if four or more start. For boats in cruising trim, in each class, a cup valued at \$100 will be given for the first, if two or more start, and a cup valued at \$50 for the second, if four or more start. Entries are also solicited for the Bennett Regatta cups—a cup for schooners and a cup for single-masted yawls, in racing trim, the latter receiving allowance under Rule 2. Entries must be made in writing and lodged with the regatta committee, at the club house, before 11 o'clock A. M., June 20. The iron steamboat Cepheus, provided for members and guests of the club, will leave Pier 1, Hudson River, at 10:15 o'clock punctually, and will touch at the same point after the regatta. Each ticket will admit the member to whom it is issued and the women accompanying him, but its transfer is prohibited by a by-law of the club. Exception is made for yacht owners whose vessels are entered for the regatta, who may transfer their tickets, provided that the names of those to whom the transfer is made appear on the back of the ticket, indorsed by the secretary of the club. The regatta committee includes S. Nicholson Kane, Chester Griswold and Irving Grinnell.

The thirty-third annual regatta of the Atlantic Y. C. will be sailed on Tuesday, June 20, starting off the club station, Sea Gate, at 11 A. M. The club offers the following prizes in each class, in which two or more yachts compete: Schooners—Class B, \$100; Class C, \$90; Class D, \$80; Class F, \$70. Sloops, Cutters and Yawls—Class H, \$70; Class J, \$60; Class K, \$50; Class L, \$40; Class M, \$30; Class N, \$25; special "thirties," \$50. Mainsail Yachts (cabin)—Classes S and T, \$30; Classes V and W, \$25. Mainsail Yachts (open)—Classes S and T, \$25; Classes V and W, \$20. Entries must be filed with Col. Austen, chairman of the regatta committee, No. 57 Chambers street, not later than noon of Monday, June 19. The measurer of the club, Mr. George Hill, will hereafter be found at No. 150 Fifth avenue, New York.

On June 4 the members of the Jamaica Bay Y. C. drew lots for the new club dories, the result being: No. 1, Vice-Com. Benjamin F. Daly; No. 2, William A. Shefler; No. 3, C. A. Allen; No. 4, Meas. Louis Pflug; No. 5, Dr. John B. Leprohan; No. 6, R. H. Kimball; No. 7,

W. J. Pell, and No. 8, Fleet Capt. F. A. Lafound. There will be races for this class every other Saturday, beginning June 17, over a short triangular course in front of the club house, two rounds being sailed for a race. The winner will be determined by a point system, as follows. First boat, 5 points, second 2, and third 1, and the boat having the greatest number at the close of the season to take the prize.

The annual regatta of the Brooklyn Y. C. will be sailed on Monday, June 19, starting at 11 A. M., off the club station, Bath Beach, Gravesend Bay. The race will be under the rules of the Y. R. A. of Long Island Sound, and open to yachts of all recognized clubs. Entries may be made to the regatta committee, Box 154, Brooklyn.

Nahma, steam yacht, estate of Robert Goclet, sailed from New York on June 7, for the Clyde, where she will lay up for a year.

Capt. Samuel Bailey, the veteran rigger of the Greenport shipyards, met with a painful accident on June 5, at Rackett's Basin, where he was finishing a job of placing the boiler in J. B. Hutchinson's steam yacht Vanish. Two shear poles, each about 40 ft. in length, had been erected over the yacht, and after the boiler had been lowered on board by this appliance Capt. Bailey and his gang proceeded to take down the poles. In doing this one of the poles slipped, and the weight carried the end against the wooden bulkhead with great force. Capt. Bailey's foot was caught between the end of the pole and the bulkhead and received the force of the fall. Fortunately the falling poles struck on a pile of boxes and the injury was not as serious as it otherwise would have been. Capt. Bailey was in great pain, and was taken to his home in a carriage, where Dr. Manaton attended him. He said that no bones were broken and that Mr. Bailey would suffer no permanent injury.—Brooklyn Times.

The Sag Harbor Y. C. has filed articles of incorporation at Albany, the directors of the club for the first year being Horace G. La Mont, of Brooklyn, and Julien A. Udall, Francis H. Palmer, John L. Sherwood and Olin M. Edwards, of Sag Harbor. The club will build a house at Sag Harbor.

Canoeing.

New York C. C.

THE New York C. C. sailed its annual spring regatta on June 10 off the club station, Bath Beach, the events being as follows:

Sailing Race, Six Miles, Triangular, Record Event.—Won by Louis H. May, canoe Aziz; time, 1 hour 49 minutes 30 seconds. F. C. Moore, canoe Pioneer, second; time, 1 hour 52 minutes 32 seconds. G. H. Plummer, canoe Kismet, third; time, 1 hour 59 minutes 47 seconds.

Paddling Race, Decked Canoes, One-half Mile with Turn.—Won by Louis H. May, canoe Aziz; Prof. Brennermann second, F. C. Moore third, Wolsley Carmalt fourth. Time, 7 minutes 3¼ seconds.

Tandem Paddling Race, Open Canoes, Single Blades, One-half Mile with Turn.—Won by John C. Mowbray and Barron Fredericks; Plummer and Paula, second; F. C. Moore and L. H. May, third; Houghton and Schuyler, fourth; Smythe and Inslee, fifth. Time, 5 minutes 32 seconds.

Filipino Race—Savage Filipinos vs. New York Canoe Club Savages—Club Fours, Open Canoes, Single Blades, One-half Mile with Turn.—Won by the Filipino Savages, Mowbray, Fredericks, Moore and Smythe; Schuyler, Paula, W. H. Fales and Plummer, second; Houghton, Inslee, Fales and Pool third. Time, 4 minutes 44 seconds.

Grand Naval Combat, Filipino Savages Against New York Canoe Club Savages.—First bout, Filipinos Moore and Fredericks defeated Smythe and Plummer; second bout, Mowbray and Foster defeated Carmalt and Houghton; final bout won by Moore and Fredericks, defeating Mowbray and Foster.

The Filipino visitors, Messrs. Mowbray, Fredericks, May and Smythe, created much amusement. The club is now in a very prosperous condition, with a fine station and club house and large membership. The officers are: D. D. Allerton, Pres.; Barron Fredericks, Capt.; John C. Mowbray, Sec'y; William H. Houghton, Purser, and Richard Foster, Mate.

Brooklyn C. C.

THE Brooklyn C. C. held its opening races on June 10 at the club house, Fifty-sixth street, Bay Ridge, the results being:

Rudd Paddling Trophy Race, Half a Mile, with Turn; Double Blade Decked Canoes.—Won by Henry M. Dater, Canoe Rattler; J. R. McDevitt, canoe Brooklyn, second; Percy F. Hogan, canoe Disgrace, third. Time, 4 minutes 20 seconds.

One Half-Mile, Open Canoes, Passenger Race, Double Blade.—Won by Harry M. Dater, canoe Ne Ne Moosha; Percy F. Hogan, canoe Poohkah, second; J. R. McDevitt, canoe Brooklyn, third. Time, 5 minutes 25 seconds.

Fifty-Yard Swimming Race.—Won by Henry M. Dater; J. R. McDevitt, second; J. F. Eastmond, third. Time, 1 minute 59 seconds.

Trap-Shooting.

Fixtures.

June 14-15.—Bellows Falls, Vt.—Interstate Association's tournament, under auspices of Bellows Falls Gun Club. C. H. Gibson, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 14-15.—Lewiston, Ill.—Lewiston Gun Club tournament. H. H. McCumber, Sec'y.

June 17.—Lyndhurst, N. J.—Contest for the Bergen county cup between Feigenspan and Money; 25-live-bird handicap.

June 17.—Hackensack, N. J.—All-day amateur target tournament by Bergen County Gun Club. C. O. Gardner, Sec'y.

June 20.—Ogden, Ill.—Ogden Gun Club's annual tournament.

June 20-22.—Wheeling, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

June 21-23.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.

June 22.—Norwalk, Conn.—Connecticut State League shoot, on grounds of Naromake Gun Club. G. B. Thorp, Sec'y, Bridgeport, Conn.

June 22.—Sherburne, N. Y.—Sherburne Gun Club tournament. J. L. Paddiford, Sec'y.

June 24.—Lyndhurst, N. J.—Contest for E. C. cup and championship of New Jersey. T. W. Morley vs. W. H. Huck.

June 27-29.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club. Wopsononock Heights. G. G. Zeth, Sec'y.

July 1.—Sherbrooke, P. Q.—Annual tournament; targets; Dominion Day: open to all amateurs. Chas. H. Foss, Sec'y.

July 1-2.—Milwaukee, Wis.—Grand tournament of Milwaukee Gun Club, in Carnival Week. S. M. Du Val, Sec'y.

July 4.—Pawling, N. Y.—All-day tournament of the Pawling Rod and Gun Club; targets.

July 4-5.—Hastings, Neb.—Hastings Gun Club amateur shoot; \$150 added. W. S. Duer, Vice-President.

July 7-9.—Denver, Colo.—Second annual tournament of the Cleveland Gun Club, at Sedam's Shooting Park.

July 8-9.—Oshkosh, Wis.—Tournament of the Winnebago Gun Club. Trophy for State target championship. Oscar Cray, Jr., Sec'y.

July 18-20.—Little Rock, Ark.—Arkansas State tournament.

July 19-20.—Providence, R. I.—Interstate Association's tournament, under auspices of the Providence Gun Club. R. C. Root, Sec'y.

July 26-27.—Ocean City, Md.—Third annual midsummer tournament: two days at live birds; two at targets; \$300 added. J. R. Malone, Manager.

Aug. 9-10.—Portland, Me.—Interstate Association's tournament, under auspices of the Portland Gun Club. S. B. Adams, Sec'y.

Sept. 6-7.—Portsmouth, Va.—Tournament of the Interstate Association, under auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

Sept. 13-14.—Cherokee, Ia.—Cherokee Gun Club's third annual tournament. J. D. Anderson, Sec'y.

Oct. 6-7.—Pawling, N. Y.—Tournament of Pawling Rod and Gun Club; targets and live birds.

First and third Fridays of each month.—Watson's Park, Burnside, Ill.—Semi-monthly contest for Montgomery Ward & Co.'s diamond badges.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme of the Altoona Rod and Gun Club's tournament, to be held June 27-29 at Wopsononock Heights, Pa., has just come to hand. It is a handsome and tastily arranged little book. On the front cover is a picture of the Heights, with the shooting grounds at Lookout Point in the foreground. In the distance are the surrounding Alleghenies, and at the foot of "Old Wopsey" lies the broad plateau into which, says the programme, two magnum traps will keep constant streams of targets pouring during the progress of the shoot. Within the book are views of various sections of the Heights, pictures of shooting celebrities, etc. The programme consists of ten events on each day, eight at 15 targets and two at 20 targets, \$1.25 \$1.75 and \$2.25 entry. Interstate Association rules will govern, and the purses in all events will be divided according to the equitable system: In 15-target events, four moneys; in 20-target events, five moneys. Targets 2 cents each, to be deducted from the purses. Shooting begins each day at 9 A. M. Guns, shells, etc., sent in care of the secretary will be delivered to the grounds free of charge. A trap will be manned and everything in readiness for shooting by noon on Saturday, the 24th, and will be at the disposal of any who desire to practice or shoot private races or sweeps. To reach the Heights, take electric cars at Altoona to Juniata Station, then P. J. E. & E. R. R. train to Wopsononock. Programmes can be had of the secretary, Mr. G. G. Zeth, Altoona, Pa.

The programme of the Ohio Trap-Shooters' League tournament, to be held June 21-23, at Columbus, O., under the auspices of the Sherman Rod and Gun Club, is issued and ready for distribution. This is an open shoot, except cup events, which are open only to members of the Ohio Trap-Shooters' League. Six hundred dollars is added—\$210 in cash and \$360 in prizes. Interstate Association rules will govern, the Sargent system of traps will be used, and the purses will be divided by the equitable system. Manufacturers' agents will be required to pay \$4 each day extra. Ten events are scheduled for the first day, among which is the race for the Ohio State Journal trophy. Eleven events are down for the second day, including the L. C. Smith trophy and championship of Ohio race, the Press-Post trophy race, and the Sportsman's Review two-men team trophy match. On the third day ten events will be shot, including the special five-men team contest for the Shooting and Fishing State championship team trophy, valued at \$300, and the special handicap amateur prize race. Guns, etc., shipped to J. C. Porterfield & Co., 11 South High street, Columbus, O., will be sent to grounds free of charge.

At Memphis, Tenn., on May 27, J. D. B. De Bow, of Nashville, defeated A. H. Frank for the State championship cup in a 50-live-bird race by a score of 48 to 43. The same day W. R. Elliston won the Memphis Gun Club cup in a 25-bird handicap by shooting out Dr. Grogg and Acklin, who were tied with him on a score of 23. The shoot-off was at 10 birds, and Elliston scored 9 to Grogg's 8 and Acklin's 6. The cup now becomes his personal property.

The Iowa Falls Gun Club will hold a two days' tournament June 28 and 29. There are thirty-one events scheduled for the two days, and both live birds and targets will be shot. The former will be trapped at 15 cents, and 2 cents will be deducted for targets. Like most of the shoots in this part of the country, this will be strictly an amateur affair. L. Hezzlewood is the secretary.

The twelfth annual tournament of the South Dakota Sportsmen's Association will be held at Canton, S. D., June 20, 21 and 22. The programme calls for ten events on the first two days and nine on the last. All events are at targets except No. 8 on the last day, which will be 10 live birds, for the championship medal. G. A. Gage, of Bridgewater, is president, and A. L. Jones, of Canton, secretary.

The Bergen County Gun Club announces an amateur shoot for Saturday, June 17, at the club's grounds, Hackensack, N. J. The opening event will be the club handicap, 50 targets; and six other events, at 10, 15 and 25 targets, will follow. Trains leave New York at 12 M., 1:10 P. M. and 2:20 P. M.

The new edition of the "Forest and Stream Trap Score Book" contains the rules adopted by the Interstate Association, together with the American Shooting Association rules, and Hurlingham. It is the most complete score book on the market. More is told of it in the advertisement elsewhere.

June 24 has been fixed upon for the contest for the E. C. cup, emblematic of the championship of New Jersey, between Messrs. T. W. Morley and W. H. Huck, at the grounds of the Lyndhurst Shooting Association, Lyndhurst, N. J.

On June 17, Messrs. Feigenspan, Moffett and Money shoot for the Bergen county cup, at Morley's shooting grounds, Lyndhurst, N. J. There will be a 25-bird handicap arranged, and sweepstake shooting, same day and place.

A five-men team race between the Pawtuxet Gun Club and the Woonsocket Gun Club will take place on the grounds of the Pawtuxet Gun Club, at Pawtuxet, R. I., on Saturday, June 17. Several sweeps will also be shot.

The third annual midsummer tournament, under the management of Mr. J. R. Malone, will be held at Ocean City, Md., June 26 to 29, inclusive. There will be two days devoted to targets; two to live birds; \$300 will be added.

BERNARD WATERS.

Fort Smith Gun Club.

FORT SMITH, Ark., June 3.—The regular weekly shoot of the Fort Smith Gun Club took place at the fair grounds to-day.

The largest attendance of the season, the most difficult targets and the shooting of Miss Oglesby were the features.

Schüler 1212021221— 9

The New York State Shoot.

It was a record-breaker, was this New York State shoot, though the latter in name only. It was a wide open shoot, save that professionals were partially barred; that is to say, they could shoot for targets only, and ten special high averages on the first three days, and in the Buffalo Audubon Gun Club event of the fourth day. Herein was a radical departure from the policy and traditions of the past, as they pertained to this matter. There were thus no target events limited to resident shooters; in short, it was open to the world, save one special trophy event, the Dean Richmond trophy. There were shooters from far and near, young and old, tall and short, lean and fat, with all kinds of powders and all kinds of guns, and yet more different ideas and theories of shooting and related matters than there were degrees of skill, and of the latter there were many. The liberal division of the purses tempted the weaker brethren to join in the competition with a good chance to break even, while, on the other hand, if they shot better than usual there was a small chance and a greater hope of money won and money to burn. There were five moneys in all 15 and 20-target events, so that eleven in the one and sixteen in the other, as to the scores, was in the money. There generally were so many shooters in the ties that the money was split up very fine, and no specially large winnings were made, considering the great magnitude of the event. Thus, while there were large sums shot for, there were many shooters who were dividing them into small parts.

The shoot took place at Buffalo Audubon Park, a place most suitable in every way. The electric cars afforded convenient transportation, running past the hotels and passing within a few hundred yards of the grounds.

Mr. Paul North was in charge of the shoot. He worked like a beaver. He seemed to be everywhere, and whenever there was a kink in the working he straightened it out quickly and correctly, and kept all the details of the tournament constantly in action. The competition was started on three magnum traps, in a line east and west, and numbered 1, 2 and 3. On the second day a fourth magnum trap was installed, and was much needed. This will be apparent when it is stated that about 85,000 bluebirds were thrown during the tournament. The traps worked well. The men went to the score in squads of five. When No. 1 squad finished shooting at No. 1 set of traps, No. 2 squad stepped in at No. 1 traps, and No. 2 squad began at No. 2 set of traps in the second event; thence No. 1 squad went to No. 3 set of traps, and began the third event, No. 2 following after in turn, followed by No. 3 squad, and so on, till the last squad had shot. Thus there were three events being shot at the same time. Mr. North after a short time had the squads so organized that as soon as one squad finished the next squad was ready to step in place, so that there was little delay in shifting squads, and many times none at all. In short, Mr. North was a most efficient and industrious manager, and he pulled the shoot through most skillfully and successfully. He was most ably seconded by Mr. Charles J. Moyer, who was squad hustler and had charge of the traps, and who worked with diligence and ability which contributed much to the uninterrupted progress of the shoot.

The very responsible and important department, the cashier's, was filled most ably by an expert, Mr. R. C. McConaughy, of Cincinnati, O. The infinity of detail in his department was systematized and handled so deftly that there was not the slightest difficulty in conducting the office. Squad cards were issued promptly, so that the shooters were kept going continuously, and the cash was all made up a few moments after the last gun was fired each day. On the evening of the fourth and last day the whole financial interest of the shoot was settled, excepting the winnings of about a dozen shooters, some of whom had left town, some had not called for their winnings, etc. Mr. McConaughy was assisted by Mr. Gill, who compiled scores, etc. The club workers were Mr. C. S. Burkhardt, who was chief manager, and Mr. L. W. Bennett. Their duties were very exacting. Considering their many responsibilities, it is remarkable that they shot as well as they did.

The trade representatives were out in goodly numbers. There were E. D. Fulford, of Remington fame; Harvey McMurchy, of the Hunter Arms Co.; R. O. Heikes, of Remington Arms Co.; A. G. Courtney, U. M. C. and Remington; J. J. Hallowell, J. S. Fanning, the Gold Dust exponent; D. Lefevre and F. Lefevre, of the Lefevre Arms Co.; and of the Du Pont representatives there were W. L. Colville, C. W. Bidwell, Neaf Apgar, H. Duckert, F. H. Conover and E. N. McCarney. B. H. Norton, Hazard powder; Leroy, Remington, U. M. C. and Du Pont; T. H. Keller, Kings Smokeless and Peters cartridges; Edward Banks, E. C. and Schultze; J. R. Hull, Parker gun, and Gus Greiff, Francotte gun; and Geo. Mosher.

There was a host of shooters who were in the amateur competition. From Cleveland came Alex. Green, J. Alexander, Redwing, James Grant, Dale, Mayo, Johns. From Baltimore came a hot squad: Hood Waters, James R. Malone, J. M. Hawkins, E. H. Storr and A. H. Fox. From West Virginia came F. E. Mallory, S. T. Mallory and J. F. Mallory, all of Parkersburg, and L. E. Mallory, Jr., of Bradford, Pa., and Dade, of Sistersville, W. Va. There were E. Rike and R. O. Heikes, Dayton, O.; C. Young, Springfield, O.; C. Powers, Decatur, Ill.; Leroy, Campello, Mass.; H. Kirkover, Fredonia, N. Y.; Shorty, Dudley, New York; Lane, Weller, L. Byer, McCord, Norton, Myer, Glover, Borst, Wayne, Case, Kirschner, Rochester; J. S. Remsen, Brooklyn, N. Y.; E. C. Burkhardt, Foxie, C. S. Burkhardt, 333, Wheeler, Leuschner, Kewau, Talsma, Norris, Griffith, Warren, McCarney, R. H. Hebard, Cooper, Oehmig, Zella, Fries, Schwartz, Horning, Buffalo, N. Y.; Wride, Sodus, N. Y.; L. B. Fleming, Bessemer, Pittsburgh; Easton, Vail, Burton, Norwalk, O.; Apperson, Kokomo, Ind.; Trego, Tyrone, Pa.; Lupus, Baltimore; E. W. Hull, Akron, O.; T. W. Morfey, Lyndhurst, N. J.; Whitney, Phelps, N. Y.; Colvin, Burlington, Vt.; Kelsey, East Aurora; Alkire, Woodlyn, O.; Doc, San Antonio, Tex.; Allison, Boston, Mass.; 99, Gates; Howe, Hingham, Mass.; Willey, Danville, N. Y.; Conover, Hamilton, Ont.; Deremo and Denny, Watertown, N. Y.; G. Piercy, Jersey City; Bennett, Montpelier, Vt.; Sporting Life, Philadelphia; B. A. and W. H. Eastman, Barre, Vt.; Weidbusch, Scranton, N. Y.; McPherson, St. Thomas, Ont.; W. M. Thompson, De May, Jackson, Mich.; Carr, Tuttle and Bridger, Auburn, N. Y.; Hobbie, Birmingham, N. Y.; Spross, Toledo; Snow, Brooklyn, O.; Mingo, Ravenna, O.; Hopkins, Jamaica, L. I.; Wapner, Briggs, Canada; Ruble, Chicago; Bissett, S. River, N. J.; Catawba, Syracuse; Thomlinson, Batavia; Du Pont, Owego; F. C. Y., Troy; Valentine and Sweeney, Albany; H. W. Brown, Binghamton; Morris, Dalley and Papworth, Baldwinsville, N. Y.; J. Hunter, Fulton, N. Y.; C. S. Fairburn, Manitowish, Brigger, F. Bennett and Wilson, Hamilton, Ont.; W. H. Burnham, York, Pa.; J. S. Boa, Chicago; Wadsworth, Wolcott, N. Y.; Friday, Albany; Poole and Taylor, Bridgebury, Can.; Price and Marrott, Simcoe, Ont.; Palmer, Syracuse; Connor, Lacona, N. Y.; Burnett, Hamilton, Ont.; Killick, Lyons, N. Y.; G. Brewer and F. Bosthroid, Jersey City; Uncle Dan Catepole, Wolcott, N. Y., and many others. There were many distinguished visitors in attendance.

A most bountiful and substantial lunch was served each day at a very moderate price, the cuisine being in charge of Mrs. Garbe. The shooters owe her a debt of gratitude for the abundance and cheapness of the eatables provided.

Expert amateurs were handicapped as follows: Each shooter making 90 per cent. or over each day paid \$4 per day to the management. Each shooter making 85 per cent. and less than 90 per cent. paid \$2. These amounts went into a special purse, to be divided pro rata among amateurs shooting through the first three days' programme, and who failed to get one of the twenty special average prizes. These amounts were deducted from the winnings at the end of each day.

The Convention.

The forty-first annual convention of the New York State Association for the Protection of Fish and Game was held in German-American Hall, corner of Main and High streets, Buffalo, N. Y., Monday evening, June 5. The president, Mr. James J. Reid, presided.

Mr. Gates, of the committee on credentials, reported that all had paid their fees and filed their credentials, and also reported the following clubs in the Association, making fourteen in all, as follows: Rochester Rod and Gun Club, Hunter Gun Club, Dansville Rod and Gun Club, Emerald Gun Club, Buffalo Audubon Club, Davy Gun Club, Peoria Gun Club of Buffalo, Spencerport Gun Club, Onondaga County Sportsmen's Association, Citizens' Gun Club, Onondaga County Sportsmen's Association, Bison Gun Club, Cazenovia Gun Club, Baldwinsville Shotgun and Rifle Club.

This committee reported in favor of the election of these fourteen clubs as members of the Association, their dues having been paid. Carried.

Mr. Gates, in behalf of the committee on credentials, said: "Last year, at Rochester, an unfortunate occurrence took place which I don't care to particularly mention, but the point about it was this: That a team was permitted to compete for the Dean

Richmond trophy that had not been elected a member of the Association, but there was some claim that they had paid their dues. Now, I would like to know from you, Mr. President, whether the competition for the Dean Richmond trophy is limited to those fourteen clubs as the members of your committee report. If not, I desire to make a motion on the subject. In other words, the people who have paid their dues and expect to contest want to know whether the competition for the Dean Richmond trophy is limited to these fourteen clubs."

Mr. Reid said: "I should certainly rule that the teams competing for this trophy come from the clubs whose credentials are before us now." He then remarked on the work done by the club and the valuable prizes collected, and continued, "It devolves on a very few men, but I wish to remark before you all and to give credit to one gentleman member of the committee who I think is very justly entitled to a great deal of credit, and it ought to be openly expressed here before every man in this room—to my friend Charley Burkhardt, on my right—that his work in this matter has been indefatigable, and I do not know what we would have done without him on the committee. I remember well the time when the club would have gone out of existence were it not for the tireless efforts put forth by Mr. Burkhardt to preserve and hold together the Audubon Club. In fact, I look upon him as the regenerator of the club and its savior, and I think it is my duty here to-night to openly express to you, one and all, my infinite gratitude for the work he has done. He has worked for you like a Trojan."

It was carried that the inanimate target championship trophy be accepted, and that the president of the club appointed to hold the shoot of 1900 name a committee to confer with this committee and to endeavor, if possible, to secure modification of the terms, so as to meet the suggestion made by Mr. Keller, which was a 50-bird race. It was carried that the secretary be instructed to send to the committee representing the donors of this trophy the thanks of this convention for the trophy offered.

It was carried that the next State shoot be awarded to the Oneida County Sportsmen's Association, of Utica, N. Y.

Mr. W. L. Colville spoke as follows: "Mr. President and Gentlemen of the Convention: I think before this convention winds up the business before it this evening that some special mention should be made of a gentleman who was a member of the State Association, who has lately departed this life. I refer,

C. S. BURKHARDT,
Manager New York State Shoot, 1899.

gentlemen, to that distinguished citizen, the Hon. Roswell P. Flower, whose death was chronicled only a few days ago. Mr. Flower, I understand, at the time of his death was an honorary member of the Watertown Club, and I think that at this time it is proper and fitting that resolutions of condolence upon his death be passed by this convention. It was the custom of people not so very long ago to regard a man who went out with a dog and gun as a person who did not amount to much; but times have changed, and so have the opinions of mankind, until to-day the shooters of America stand in the foremost ranks of citizens, of business men and of statesmen, and when such a distinguished citizen and statesman as the late Hon. Roswell P. Flower lends his name to this Association, I think this Association, upon his death, should take some action, and I therefore move you, Mr. President, that a resolution of respect to the memory of the late Hon. Roswell P. Flower be passed at this meeting." Carried unanimously.

The president read the names of the following gentlemen who have been selected to act as the officers of the New York State Association for the Protection of Fish and Game for the ensuing year: Henry L. Gates, President; Dr. A. R. Simmons, Vice-President; Charles R. Minzer, Secretary; Oscar A. Wheeler, Treasurer.

The convention adjourned to meet next year at Utica. The motion being regularly seconded, it was put before the convention. Unanimously carried. The convention then adjourned.

First Day, Tuesday, June 6.

The weather was delightfully clear and pleasant, and the great tournament began on time under the most favorable conditions in that respect. A wind blew betimes with grateful breeziness from the south, which was in a direction from the shooter to the traps, most comforting to those present, the weather being hot, but most disturbing to the flight of the targets, which ducked quickly in their flight or took a flatter and more erratic course in consequence and made goose eggs appear in the scores with frequency. Those who shot in the morning had the breeziest part of the day. Later the breeze was intermittent. About 5 o'clock the weather became cloudy and a very light sprinkling of rain fell, whereupon the sky quickly cleared up again.

Notwithstanding that the three traps were kept running up to their full limit and the squads one after another were kept ready to follow each other with hardly a moment's delay, the eighth and ninth events were but partially finished and were carried over to the second day.

There were nine events on this day's programme, four at 15 targets, four at 20, these eight having a uniform entrance of \$2, and one at 25 targets, \$5 entrance, \$500 guaranteed purse, and surplus added. In each of the other events \$25 was added. Thus the total entrance for the day was \$21 and the total number of targets was 165. Notwithstanding the erratic targets there was some great shooting. Charley Young broke 162 of the 165 targets, with a number close up to him.

\$2 in each event, excepting No. 3, which was the Grand Merchandise event, entrance \$5. In this there were eight classes of ties, a total of 108 prizes. Of these, ten were assigned to the ties on 25; twelve to the ties on 24; thirteen to the ties on 23; 11 to the ties on 22; thirteen to the 21s; eleven to the 20s; nine to the 19s; eight to the 18s. The ties on 25 numbered nine; eighteen tied on 24; twenty-three on 23; seventeen on 22; twenty-two on 21; twenty-three on 20; nineteen on 19 and eight on 18. The 25s were F. E. Mallory, L. E. Mallory, Jr.; Rike, Schorty, Hawkins, Apperson, Kary, Spross and Ward.

The 24s were Dade, James, Alex, Powers, Kirkover, Storr, Malone, Stine, C. S. B., Morley, Meyer, Burton, Kelsey, Hopkins, Renecke, Ruble, Elwing and Wayper.

The 23s were Redwing, Young, Weller, Byer, Vail, Green, Easton, Trego, E. W. Hull, Whitney, R. G. Wheeler, Alexander, Pumpelly, G. Bennett, Conover, W. H. Eastman, Gifford, Wayte, J. S. Boa, Tuttle, Talsma, Zoeller and Floss.

The 22s were S. T. Mallory, Hood, Hammond, Lupus, McCord, Alkire, Sweeney, Thompson, 99, F. G. Wheeler, Howe, Allison, Fairbairn, Denny, Pankner, F. H. Kennedy and Poole.

The 21s were Grant, Dale, Midge, J. F. Norton, Fox, Dudley, Du Pont, Leuschner, Mingo, Sporting Life, W. H. Brown, E. S. C., F. C. Y., Valentine, J. Hunter, Hobbie, Carr, Briggs, Tracy, H. Burnett, Palmer and Cummings.

The 20s were the sixth class. They were J. F. Mallory, Inman, Remsen, E. C. B., Fleming, Bartlett, Bissett, Catawba, Piercy, Lane, Kirshner, B. A. Eastman, Daley, Wilson, Hyland, L. Norris, Graham, Tray, Covert, F. Lefevre and McPherson.

The 19s were 333, Glover, Snow, Willey, Fries, Cooper, Price, Holmes and Nick.

The eighth class were Weidebusch, Gates, Morris, Hadley, R. H. Hilbard, R. S. Stephens, Bowman and Wadsworth.

It will be perceived that in several of the classes there were more in the ties than there were prizes. The contestants who were tied on 25 solved their troubles quite happily, for they appraised the prizes, the result being a total valuation of \$162, allowing each one \$18. Then each one paid the difference between \$18 and the article he wanted if it was appraised about that amount, or was allowed the difference in cash between the appraised article and \$18 if it was less than that amount. The result was: F. E. Mallory secured the Parker hammerless; L. E. Mallory the bicycle; Apperson the camera and plate holders; Ward a case of whisky; Shortmeier a guitar, etc.

The 24s and nearly all the other contestants in the other classes of ties were much dissatisfied. There were many who thought the ties should be shot off, holding that the result should be decided by a competition from start to finish, rather than starting in a competition and ending in a lottery. On the other hand, there were those who were averse to competition if lots could be drawn to settle the matter. Groups gathered here and there discussing the matter pro and con, but after a long while the result was that lots were drawn. There were a few in the ties who did not know the matter was so settled till all was over. Much dissatisfaction resulted. Some referred to the statement in the programme which read as follows: "Our Grand Merchandise event contains a very valuable list of prizes, and is so arranged that every man getting a good place in ties is sure to get a prize worth considerably more than the entrance, and also practically guarantees that every man getting 18 or better will get a good prize." By the lottery disposition of the matter, some men who got 24, 23, etc., got no prize. The better way would have been to have shot it off.

In the second class of ties, Mr. E. Reinecke got the Smith gun. In the third class Vail got the Remington gun. In the fourth class F. E. McCord got the Lefevre gun. In the fifth class Leuschner got the Ithaca gun. In the sixth class Remsen got the Hollenback gun, which disposed of the guns. The best prizes in the seventh and eighth classes were sewing machines. Thus closed an event which ended most unpleasantly, which is the way with most merchandise competitions when hard and fast rules are not made to govern the finish as well as the start. A shoot-off would have been acceptable to the large majority, and would have made a definite conclusion on actual competition as to the merits of the men as shots, deciding the matter then, instead of a mere matter of chance in which shooting skill was no factor at all.

There was a large number of spectators on this day, of whom a number were ladies.

The remarkable shooting feature of the day was the performance of Apperson, who missed only 3 targets out of the 170 shot at, a total of 167, and a gain very near to 98 per cent.

On this day 178 shooters participated, the Merchandise event being a very tempting inducement to all.

A fourth magautrap was installed on this day, which made the shooting facilities about equal to the demand. This enabled the management to clear up the left-over part of Tuesday's programme and all but a small part of this day's programme. Without the fourth trap the programme probably could not have been finished. As it was, only a part of the last event, No. 9, was left over to the following day. Something over 30,000 targets were thrown in the different events on this day, an extraordinary number, overshadowing everything of the kind which has a place in the history of the sport.

Bailey	12	10		22

Third Day, Thursday, June 8.

The programme of this day was precisely like that of Tuesday. There was a total of 165 targets, and a total of \$21 for the day's entrance in all events. The weather was very similar to that of the previous days, the wind still blowing from the south, but the weather was cooler. There was a great crowd of spectators, gentlemen and ladies. The programme was run off smoothly, the fourth magautrap relieving the pressure, and there also was a reduced number of entries.

Young fell off somewhat in his shooting, scoring 149 out of 165. Powers was high, losing but 5 of the total.

The Expert Averages.

To the ten high guns of the experts who shot through the entire programme of the first three days, the club gave \$10 each. To the first average, the club gave a gold watch chain set with a diamond. The club defined experts as those who were manufacturers' agents or who are known and recognized as professional trap-shooters. First average in this class was won by Mr. K. O. Heikes, who broke 468 out of the 500 shot at, an average of .936, Leroy being close up with .934, and Fanning in turn following close with .922. The ten high men for the three days were:

Shot	at.	Broke.	Av.	Shot	at.	Broke.	Av.
Heikes.....500	468	.936	Banks.....500	451	.902		
Leroy.....500	467	.934	Fulford.....500	447	.894

Hallowell.....500	453	.906	Apgar.....500	433	.866		

The New York City Trophy.

This trophy is a beautiful, large silver cup, valued at \$200, and was donated by members who reside in New York city. It is emblematic of the target championship of the State of New York. The conditions in this shoot were that the shooter making the highest score in the first three days' programme—that is, the highest average on a total of 500 targets—should be the winner, and the competition was open to all residents of New York State, professional and amateur. The winner of the cup executes a bond in the sum of \$200 to the State Association as a guarantee for the return of the cup.

Mr. F. D. Kelsey was the successful competitor, on a record of 460 targets broke out of the 500 shot at, an average of 92 per cent.

Fourth Day, Friday, June 9.

The weather had changed in a way to make favorable conditions for big scores. Hardly a breath of air was stirring till late in the afternoon. The sky was hazily overcast, the sun being hidden, but the light was soft and good. The targets held to true flights and were sharply distinct in the even light. There was no retraction on gun barrels or targets, or glare to strain the eyes, and there consequently was a general improvement in scores under the improved conditions. There was a falling off in the number of shooters. The target programme was finished early in the afternoon, and there were but two of them on the programme, namely, the Gold Dust Powder event, \$2.50 entrance, five moneys, and a 1lb. can of Gold Dust powder and powder measure to each of the fifty high guns. There were sixty-six competitors in this event, of whom Weidebusch, Glover and Fanning made straight scores, while Hull, Boa, Hood, Griffith, Ruble, Dade, Kelsey, Stine, Meyer, Rike, Leroy and Apperson missed but one each. The 23s were Swiveller, Vail, Wayer, Byer, Wride, Kirkover, Storr, Fulford, Allison, Ward, F. E. Mallory, L. E. Mallory, Heikes, Whitney, Hawkins, Fleming, Powers and Apgar.

No. 2 was the main event of the day, and was about the only one of the meeting which gave the manufacturers' agents a chance to compete for something of material and immediate advantage, as it was a handicap at 50 targets, open to all, entrance \$5. There were six prizes, valued at nearly \$1,000. These, after the event was finished, were sold on a cash basis, the amount, \$582, being then equally divided between the twenty-four who tied on 50, who were Heikes and McMurphy—both scratch men—and Carr, Tuttle, Reinicke, Howe, Bessemer, Stine, E. S. C., Morfey, Meyer, McCord, Whitney, Hawkins, Powers, Leroy, Gates, Leuschner, Denny, Weidebusch, Wride, Hopkins, Hood and Storr. Each received \$24.25. There were three of the Baltimore squad straight in this event—Hood, Storr and Hawkins. There was no wrangling or unpleasant feature in this event, as there was with the Merchandise event of the second day. The scores of both events are given in the table below:

The Dean Richmond Trophy.

This was the State event, the only one of the programme, and was shot off at 15 live birds, \$20 entrance per team, birds extra, 60 per cent. of purse and trophy going to first team, 40 per cent. to second. Two clubs tied for first on a score of 42—the Audubon Gun Club and the Onondaga County Shooting Association. They agreed to divide the money, but shot off for the trophy on 5 birds. They tied again, the score being 13 each. On the second tie the Audubons killed straight, while the Oneidas lost two birds. The Audubons thus won the trophy.

There were eight teams in this contest, three men to each team. Mr. T. W. Morfey refereed the first 15 birds. Mr. L. H. Schortemeier refereed the shoot-off. There was a dense crowd spread far and deep on each side witnessing this contest, and the applause which greeted the victors bore testimony to the great interest felt in the event.

The birds were a very poor lot as a whole, many sitting when the trap was pulled or dawdling away on the wing in the most indifferent manner. Occasionally a good bird was trapped, but such was the exception. Nevertheless, there were a number of good kills made, which evoked great applause. Many of the long shots, however, were due more to the slow time of the shooter than the swiftness of the birds. With the better shooters, the birds were rarely hard for the reason that such shooters never permitted the birds to get far enough from the trap to become hard.

The sensational shot of the event was Glover's 11th, a lubberly dark bird, which flew about as fast as could a wheelbarrow if it had wings. He missed it clear with his first barrel, though it rose slowly; then he held his fire, and, waiting till the bird laboriously and slowly flew overhead toward him, missed it neatly and widely, to the great hilarity of the multitude. Courtney's 2d, 7th, 9th and 10th were fairly good birds. Gates' 9, 10 and 11 were all good, two of which were missed. McCartney's 4th and 5th were good ones. Dalley's 1st and 4th were his hardest, although his 9th, a miss, was not at all easy. Kirkover had a swift second bird, and a good quartering incomer in the 11th. Heinhold's birds were all quite easy. Cooper's 4th, 6th and 9th were his hard ones. Meyer caught a corker in the 6th, and it almost got out of bounds, though hard hit. Mosher had a straight score till his last, a hot straightaway. Dr. Kilburn's 4th and 5th were his hardest. Emond's two misses were on swift birds. Morris was favored with easy ones. Burkhardt shot in quick time, and an uphill race, having missed his first. Reinecke drew easy ones, 333's last bird

was a hot left incomer, and was missed. Byer had easy ones. McMurphy shot as a man who would not be denied what he wanted. Fulford had several hot ones, but he negotiated them very neatly, according to their needs. Stacy's averaged very easy, but he showed he could shoot better ones if they chose to appear. Papworth's first was about the hardest one he had, and he treated it to a goose egg. Kelsey shot in good form, though losing his first. McCartney's three misses were on good birds. A circling incomer tangled Foxie in the first, and was the only one he failed to register correctly. Glover was not in his usual good form.

The wind blew from the shooters to the traps, about a 7 o'clock wind, though it was so mild it had little if any effect on the birds. The sky was cloudy when the race began, but the sun broke forth in the fifth round, in the ninth round it became cloudy again. The details are all set forth in the scores, which follow:

The Shoot-Off.

The shoot-off for the trophy evoked the most intense interest and excitement. When Kirkover finished straight the applause was tumultuous, almost equal to the applause of the winning team when the last shot was fired.

The Syracuse Gun Club and the Bison Gun Club divided second money. The scores:

Audubon Gun Club.	Second Tie.	Third Tie.

E Fulford.....2 2 2 2 1—5—13	2 1 1 0 1—4—13

Guns, powders and shells used in the Dean Richmond trophy contest were as follows:

Gates used a Greener gun, Schultze powder and trap shells. Fulford used a Remington gun, Schultze powder and trap shells. Kilbourne used a Francotte gun, Schultze powder and trap shells. Courtney used a Remington gun, Schultze powder and trap shells. McMurphy used a Smith gun, Schultze powder and trap shells. Mosher used a Syracuse gun, Du Pont powder and smokeless shells. Myer used a Smith gun, E. C. powder and trap shells. Byer used a Parker gun, Gold Dust powder and trap shells. Glover used a Parker gun, Schultze powder and trap shells. Foxie used a Smith gun, Du Pont powder and smokeless shells. Cooper used a Lefevre gun, Du Pont powder and trap shells. 333 used a Smith gun, Latfin & Rand powder and trap shells.

Kirkover used a Parker gun, Du Pont powder and trap shells. Kelsey used a Smith gun, Schultze powder and trap shells. C. S. B. used a Parker gun, Du Pont powder and trap shells. Emond used a Smith gun, Du Pont powder and trap shells. McCarthy used a Colt gun, Du Pont powder and trap shells. Stacy used a Francotte gun, Du Pont powder and trap shells. Heinold used a Greener gun, Du Pont powder and trap shells. McCartney used a Parker gun, Du Pont powder and trap shells. Reinecke used a Syracuse gun, Du Pont powder and trap shells. Papworth used a Lefevre gun, Du Pont powder and smokeless shells.

Dalley used a Greener gun, Du Pont powder and smokeless shells.

Morris used a Lefevre gun, Du Pont powder and smokeless shells.

Guns, Powders and Shells.

Only an approximate mention of the number of each kind of guns, powders and shells used can be given, although one man occupied himself diligently in gathering the information herewith given:

Guns: Smith, 39; Parker, 32; Lefevre, 16; Winchester, 12; Remington, 9; Greener, 8; Francotte, 7; Baker, 4; Burgess, 2; Prechtel, 1; Scott, 1; Purdy, 1; Syracuse, 1.

Powders: Du Pont, 59; Schultze, 29; E. C., 14; Hazard, 11; L. & R., 9; Kings, 6; Gold Dust, 4; Troisdorf, 1; Oriental, 1; Walsrode, 1.

Shells: U. M. C., 101; Winchester, 37; Peters, 6; U. S., 1.

Side Lights.

The Baltimore Shooting Association was represented by seven members, who wore black blouses, on the breast of which in orange letters was the legend, "Baltimore S. A." The oriole colors were well to the front from start to finish. On the first day the squad members, Messrs. Hood, Waters, Hawkins, Malone, Storr and Fox, finished first in the amateur teams, averaging .915 for the whole squad. In the eighth event they broke 95 out of 100; in the ninth event, 94 out of 100. On the second day, fourth event, 15 targets, they broke 73 out of 75, and on the third day, in the first event, they broke 72 out of 75. Hood Waters' average on the first day, .968, was a great percentage; on this day he broke 54 straight. The squad's average for the three days was .901. Much credit is due to Captain Malone's efforts in organizing the squad and in maintaining the interest to a degree which brought it into competition. This was Mr. Storr's first tournament of importance, and Fox's first shooting over a magautrap. The squad used Schultze in U. M. C. shell.

The West Virginia squad also gave a good account of itself. In it were Messrs. F. E. Mallory, S. T. Mallory and J. F. Mallory, of Parkersburg; L. E. Mallory, Jr., of Bradford, Pa., and E. O. Bower, of Sistersville, W. Va. They were the first squad in the order of shooting. On the first day the squad broke a fraction over 90 per cent., and the same on the second day out of the 850 targets shot at. On the third day they broke a fraction over 87 per cent., a most excellent showing as a whole.

There were several tents pitched on the shooting grounds, the largest of which was that of the Audubon Gun Club, which covered a liberal space, affording seats for the spectators and a good place for a display of the manufacturers' goods. There also was the Canadian tent, the West Virginia tent, the Ohio tent, the Rochester tent, the Du Pont and Hazard tents, in which were large supplies of ammunition, and the refreshment tent, presided over by Mrs. Garbe and several very pretty waitresses. Could the Spaniards have seen those tents before the war began and heard the rapid firing of the line of squads, they would have indeed considered that life was worth living and that there should not be any war.

On Thursday evening Mr. W. L. Colville, known well to readers of sporting literature as Dick Swiveller, gave a most charming dinner to a circle of friends at the Hotel Iroquois, Buffalo. They were Messrs. A. C. Paterson, W. K. Park, J. J. Hallowell, J. S. S. Remsen, A. G. Courtney, H. Kirkover, B. H. Norton, Rolla O. Heikes and B. Waters. An ordinary was reserved for the exclusive use of the party. The dinner in its arrangements was the work of a master mind, and was only equaled by the appreciation of the guests. Mr. Colville expressed the extreme pleasure he felt in a few appropriate remarks and the dinner proceeded with great success amid an enthusiastic discussion of explosives, velocities, penetration, recoil, and this, that and the other thing concerning shooting.

At the coffee stage Mr. Colville gravely assured his guests that he had given great thought to the subjects under consideration, and knowing what would be the topics of discussion, he had prepared a short paper which would settle every debatable point for all time, and all would then be res adjudicata, etc. The group was deeply interested, and every face was turned to him with that look which one sees on the faces of people who are looking at the camera as the photographer is about to press the button. Without any change in his serious countenance, Mr. Colville read as follows:

"The examination of the different theories regarding the age of man is a subject of interest. Nature is an inexplicable, eternal mystery which baffles the strenuous efforts of mighty intellects to learn the open secret which tempts the inquisitive understanding of man. Her veil is forever closed against the meager intelligence of humanity. However dexterously we may snatch facts and laws from her, we are unable to fathom the depths of the inner meanings of nature. The naturalist, Pliny, jumped into the crater of Vesuvius to no useful effect.

"The laws of Kepler and Newton are not sufficient to illuminate the smallest fraction of the darkness of the human intellect. But after all, in spite of our intellectual weakness, we know some eternal facts of nature from which the scientists deduce, or rather see, laws and theories. The scanty knowledge tempts us to proceed further into the realm of the known.

"Thus, the human being strives to understand the great truths underlying the heterogeneous and ever-changing phases of nature. There is great pleasure in the attempt and the consequent failure. But like an unfortunate child, the intellect of man, backed by his divine nature, again attempts and discovers many facts which are efficacious in the construction of laws and canons.

"If external nature is a mystery, the human race that at present reigns supreme over the original creatures of the world is still more inscrutable—the life, the consciousness, the nature of man—mysteries of the mystery. The strange but scientific blending of the organized character of man and his unearthly nature transcends human power of reasoning and imagination, and he is left to grope in the darkness of semi-intelligence surrounding theories, the facts that are veiled by his opaque understanding. The many minds of many man, divergent as they are, yet at times will come together in cohesive agreement on some point and subject. A fair illustration of this is presented to us in the present generation, where it is agreed that the insidious effects of the ithisorous and ignowadon should be guarded against. Beware of these germs, which, entering the blood corpuscles and finding lodgment at the base of the brain at the apex of the spine, will surely work their way to the index finger and thus throw the nerve centers from equilibrium, and a consequent distraction of range-finding, resulting sometimes in partial dementia, the only remedy for which so far known to science is the liberal administration of a powder the name of which it is useless to mention, so time-honored and efficacious has it become. This powder administered in 37 to 42 grain doses, made up in U. M. C. and W. R. A. capsules, will be found to relieve overanxiety, fluttering of the heart at exciting moments, preservation of the shoulder muscles, a general lessening of worry and perturbation of spirit. It brings carefulness and contentment, sweetens the temper and prevents to a superlative degree what is vulgarly called 'kicking.'

"Inclosing these brief remarks, gentlemen, I beg to thank you for your close attention to the details of an event that has been the cause of bringing together so many brainy and representative men of the country. It is seldom in the course of mundane affairs that such occasions occur; it is therefore with more than passing satisfaction that I am enabled to

The Soo Tournament.

STROUX CITY, June 9.—After one has attended a tournament given under the auspices of the Soo Gun Club he can readily understand to what the great success of this organization's shoots may be attributed. Here one finds the glad hand of fellowship extended to him everywhere, and there is no organization of a like character whose officers and members are so universally popular, both individually and collectively, while the pride and interest they manifest in their visitors and guests are commendable. This seems to be the chief aim of the club, and the revenue of these shoots seems to be a secondary consideration, for the main object and desire seem to be the comfort and pleasure of the participants. This element is not always in evidence at other shoots; so that with all these desirable factors it is easy to discern why this club's tournaments have been so well attended for the past three years, and why they will continue to be popular in the future.

True, collectively the attendance was not so large as in the two previous years, but take the percentage of those who shot through the programme on each day, and it will exceed that of the former shoot, while it will also be found second to none in the country.

The record and reputation the Soo Gun Club has established in this respect may well be a source of pride to the officers and members, for it is well merited, and there is nothing that has done more to advertise the city. If all its other affairs are conducted with the same able executive ability, it is indeed a fortunate community. Nothing but continuous success can ever be attributed to the energy and enterprise of Mr. C. H. Hamilton, president; Mr. H. H. Hawman, treasurer, and Mr. E. R. Chapman, secretary. The latter is deserving of especial mention, as he, almost, unassisted, took care of all the detail work in the cashier's office, and that too with exactness and dispatch.

Shooting Grounds.

Few clubs in the West are so well fixed in regard to grounds and equipments as this one, which owns the grounds on which it shoots, a plot of fourteen acres, on the bank of the Missouri River. Here they have erected a nice club house, a two-story structure, with a broad veranda extending around three sides of the building, this also being two stories. The lower floor is used for gun room and lockers, while a part of it is set aside for an office. The upper floor is one large room, where the shooters may lounge about, and on this occasion it was used for a dining room, being amply large for this purpose. The veranda facing the grounds is 2ft. long and 8ft. wide, so it will readily be seen that it will accommodate quite a large crowd.

This club does all its target shooting over a magatrap, and on this particular occasion three of these machines were used, which is perhaps the first time this has ever occurred. Mr. Chas. North, of the Cleveland Cartridge and Target Co., has charge of these, and under his fostering care they never failed to perform consistently. Mr. North was ever attentive to business, and his quiet, gentlemanly demeanor cannot help but add to the popularity of his company's goods. There was no shelter over the score, but just in the rear there was a long wooden structure for spectators and shooters. A picket fence separated these from the shooters at the score, so that no one could encroach upon those actually engaged in shooting. One other feature is the nice cinder walks at the score, which makes a very desirable footing for this purpose, these being smooth and hard. The shooters faced south and shot toward the river, so there was little interference from the sun, and the background was also very good. In addition to these many desirable features, the grounds are also equipped with a set of live-bird traps which embody the underground system of trapping, all of which go to make up a first-class shooting grounds.

Programme.

In regard to this, the club had gotten out a very nice one for the average amateur, but it erred in giving all the cash as average money, in place of adding it in each event; for by doing this the ordinary and erratic shooters stood no chance whatever of getting a part of it, for only those who shot consistently well could hope to win any of these prizes.

Again, the class system should not have prevailed in the dispensation of this money, for this encouraged dropping for place, while its inequity should preclude its use by any organization which has the welfare of the sport at heart. Furthermore, the giving of prizes for low averages should also be discouraged; for while it is doubtless encouraging to those who have actually shot bad to get some returns, it also has a tendency to breed crooked shooting, and the unscrupulous shooter ever stands ready to take advantage of this. Merit and equity should receive the most consideration in competitions of all characters. When clubs desire to give high average prizes these should always go to the high guns.

Hamilton is a one-arm shooter, and to land a part of the money under such a handicap is therefore all the more creditable.

There are five merchandise prizes for the five low averages, and these went to Ray, Redfern, Aney, Fogg and Andrews and Cook, the latter pair dividing fifth prize.

The weather conditions were ideal, and there was not a breath of air to interfere with the flight of the targets.

Gilbert made the high run of the day—95 straight. Events Nos. 2, 5 and 8 were known-angle events. All told, eighty-five participated, and of this number sixty-two shot all the programme.

First Day, Tuesday, June 6.

One of the chief features of to-day's shooting is the number of participants who shot through the entire events. Sixty-nine of the eighty-two principals shot everything on the schedule, and I question if a similar number have done likewise anywhere else, though it is possible that this number may have been equaled at Knoxville in its palmy days.

This is an amateur shoot, but the competition is as classic as though all of the "profes" were present, and the rank and file is setting the pace that requires constant attention and consistent large totals to get a part of the average money. There are but two trade representatives on hand, Gilbert and Budd. The former, by constant hard grinding, managed to lead the bunch, but he found this no snap, as he has but a margin of three breaks over Peterson and Mortenson, who are second, while that little brother-in-law, Klein, was hunching him some too. Whenever this trio are present, they make the leader get nearly all of them, and this is what Gilbert came very near doing. He has a run of 77 straight to his credit, and in addition to his total shown in the programme, he has 30 more breaks to his account.

The programme provides for ten averages of \$10 each, but this is divided class shooting, and thus twenty-six share in a division of this money. By this Peterson and Mortenson get \$5 each—they divide first average. Had Mortenson been mean enough to drop his last bird he would have been \$5 better off, as would also Peterson, but to Mortenson's credit it must be said that he scored this, although by doing so he was aware that it would cost him \$5. Mortenson shot in squad No. 12, while the other high men shot in the early squads. Klein broke 2 targets less than either of the above, but he wins second average without a tie. J. Boyd Sittler and Gage tied for third average, and they each got \$3.30. Then again Sonders got fourth average alone. Hunter and Steege have to be content with \$5, while Hughes, who is lucky, but breaks less birds than they, gets \$10. Seventh average is cut up by Kimball, Baldwin, Rust, Trotter and Taylor. Aney, Kortright, Furgeson, Burk, H. Boyd and Lewis divide eighth average, Palmer, Dorton and Wood take ninth, and Crabill and Elliott tenth. The injustice of awarding averages in this is so apparent that it is unworthy of any comment. There are also five low-average merchandise prizes to the value of \$10, which are given in the same manner; thereby Cowan, who broke but 89 out of 150, gets first; Pat, with 101 out of a like number, takes second; Terryberry and Slocum, with 103, divide third; Thurston, with 106, gets fourth, and Redhead, with 108, is given fifth. This came about by virtue of a total of 5 in the closing event.

The best squad record of the day was made by a squad composed of the home club, which contained J. Boyd, Hunter, Hawman, Duncan and Hamilton, they breaking 74 out of 75, running straight up to the 50th round, when Hamilton slipped one. Owing to the fact that Mr. Hamilton is a one-armed shooter, this miss is quite excusable, as of necessity he is shooting under a great disadvantage.

The weather opened up favorably, but by noon it had clouded up, and soon after that it began to rain quite hard. That the programme was shot out is due to the use of three magatrap, which are under the fostering care of Chas. North.

The programme consisted of ten 15-bird races. The tabulation must convey any additional details. Nos. 2, 5 and 8 were known-angle events.

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.
Gilbert	14	14	14	15	14	15	15	15	15	14	150	145	.966

Second Day, Wednesday, June 7.

Most of the principals in to-day's competition were here yesterday, and have thereby been enabled to familiarize themselves with the surroundings; so that not a few have doubtless profited by this. At any rate, the competition was much more spirited, so that high averages and straight scores were the prevailing features. Gilbert, who is only in the exhibition business at this tournament, is again high man, with the capital average of .986, having lost but 2 targets all day. Among the amateur class you will find Crabill and Taylor tied for high honors, with an average of .953. Hughes is second, .946; Klein third, .940; Peterson fourth, .933. Then come Kimball, Sonders and Palmer, .926, fifth, and these are followed by Steege and Wood, .920, sixth. Next is Gage and Mortenson, .906, seventh. Now come Dorton and Peck, .886, eighth. Then Shaw, Budd, Baldwin, H. Boyd and Duncan, .893, ninth. Kortright, Patch, Calif and Powers, with .886, divide tenth average. As yesterday, there are ten high averages of \$10 each, which, by virtue of the class division, permits all the above-mentioned, with the exception of Gilbert and Budd, to share in the purse, in accordance to how many there are in each class.

Event No. 7 constituted the race for the interstate championship cup, and this showed seventy-nine entries, of which twelve—Crabill, Hamilton, Wood, Mortenson, Hogan, Klein, Palmer, H. Boyd, G. E. T., Gold Dust, Ellis and Higgins—finished with straight scores, and then shot it off miss-and-out, which resulted in a win for Frank Crabill, of Missouri Valley, Ia., who was only required to break eight straight; \$10 each went to the three next highest, and Hamilton, Wood and Mortenson got this.

Dorton	9	19	19	19	19	19	19	35

The table shows that Saunders shot at 35 and scored them all, but he dropped one in the shoot-off in the team race. The club added a sum equivalent to 10 per cent of the purse in to-day's event. The weather was again fine.

General Averages.

In this respect the showing is not so good, for the reason that but few remained over for the fourth day, as there was practically nothing to hold the shooters, and there were no general average prizes. Thus it is that but thirteen shot through. Of these, Gilbert, who has been shooting an extraordinary pace throughout, is high with .973; George Peterson is second with .943; Klein third, .935; Budd fourth, .933, and Mortenson fifth, .927. The others appear in the table in the order. To the credit of the local club it must be said that four of the thirteen whose names appear in this table are its representatives. One other, Hunter, was forced to withdraw from the last two events, owing to his gun breaking down.

Shot	at.	Broke.	Av.	Shot	at.	Broke.	Av.

Fitchburg Shots in a Wind.

FITCHBURG, Mass., June 7.—In spite of the excessive heat there were eleven shooters in attendance at the shoot of the Fitchburg Rifle and Gun Club Monday, June 5. It was by far the hardest shooting we have had this season, owing to the high wind, which seemed to whirl in from every quarter, playing havoc with the targets and keeping the shooters guessing. The team shoot came just in the thickest of it, when an advancing shower was preceded by a liberal amount of wind that twirled the targets in a way that was anything but gentle. The result can be obtained by a perusal of the scores. Oh, no! we don't claim to be experts; if we were, such trifles would not trouble us. Dix and Edwards had to step down into the ranks, while Converse and Hawkins rise to take their places, only to fall again at the next shoot. The scores:

Events:	1	2	3	4	5	6	7	8	9
Targets:	10	10	10	10	10	10	10	10	10

Centerdale Gun Club.

CENTERDALE, R. I., May 30.—The Decoration Day shoot of the Centerdale Gun Club was successful in every respect. There was a large attendance of spectators and a long list of shooters. A strong wind made the shooting hard. Nos. 10, 11 and 12 were extra events. Scores:

HARTLEY FRANKLIN, Sec'y.

Haverhill Gun Club.

HAVERHILL, Mass., May 30.—Our Memorial Day shoot is now but a pleasant memory, made so by the fact that it was the best of our many good ones.

If the visiting shooters succeeded in extracting a little of the pleasure that it gave us in trying to entertain them, we are indeed satisfied.

We were favored with good weather, which would seem to prove the efficacy of hoping for the kind we had, as our club to a man have been chanting wishes in many different languages for a good day, these many weeks.

We were expecting a good attendance, but not in any such numbers as invaded the quiet of Hoyt's Grove between the hours of 10 and 11 A. M. In the advance notices of the shoot, and also on the programmes, we proposed giving a lunch complimentary to shooters and their friends, and the promise was adhered to down to the smallest particular, for it was just a lunch—for the number present—and nothing more; they all assured us in an extremely well-bred manner that it was ample, and while we appreciate their kind indulgence, we still think it would have been better to have had enough left over to make one fly think life was worth the living.

Our specially invited guests, the Portsmouth Club, responded with a full squad, and were accompanied by several ladies. Thos. Howe, of Hingham, with his "Gatling gun"; LeRoy, shooting his usual rapid gait and murmuring something about "Du Pont's"; Billy Allison, wearing the same old hat, and shooting with his usual skill; Miskay, Williams and Horace, who are very near relatives, and who in their early days were given, not tin rattles and drums for toys, but such articles in the shooting line as they now use so effectively, in all probability; Climax, better known to us as Jimmie Burns; Rule, who said he was coming to visit us again, and would on that occasion have some shot in his loads, and many other shooters from the different cities and towns of our own State, in addition to several from New Hampshire.

Shooting began at 10:15, and notwithstanding the lateness of the hour we trapped nearly 5,000 targets, with but twelve broken in trapping by actual count. The members' handicap prizes were won by the following: First, sole leather gun case, by President George; second, 64 lbs. Du Pont smokeless, by Merritt; third, 100 loaded shells, by Graffam, our latest recruit.

The shooting on the whole was very good, taking into consideration the strong wind; but the contest for the prizes was not so sharp as was the case at our April 19 shoot, most probably caused by the sleepless nights of the prospective winners, numbering possibly the entire list of contestants, who were doubtless lying awake for the purpose of practicing an unconcerned look when they should be declared the winner of one of the prizes. We are inclined to have a warm spot in our hearts for the Portsmouth boys, and fear they might have been neglected more or less during the day, as we are still bunglers at running a shoot, and doubly so while trying to act the role of entertainers, with all the details to look after. This same Portsmouth Club are past masters in the art of royally entertaining visiting shooters, which fact was demonstrated to the writer, who made one of a delegation from the Haverhill Club a few years ago. FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, JUNE 24, 1899.

VOL. LII.—No. 25.
No. 346 BROADWAY, NEW YORK

Sport may be defined as the fair, difficult, exciting, perhaps dangerous, pursuit of a wild animal, who has the odds in his favor, whose courage, strength, speed or cunning is more or less a match for or superior to our own, whose natural instinct engages a considerable amount of our intelligence to overcome it, and whose death, being of service, is justifiable. Lord Lovat.

HUNTING PRESERVES AND RENTALS.

ONCE a year there comes to us from a real estate firm in Scotland a register of deer forests, grouse moors, low-country shootings and salmon fishings which are for lease; and the compendium is never devoid of suggestion of the magnitude of the interests of the game preserves of Great Britain. The system is one of which we have no counterpart in our own country, and yet the signs of the times appear to tell us that the beginning of it will be known here in some modified form in the not distant future.

The preserves listed as for lease comprise, of course, only a part, and we assume a minor part, of all the shootings which are to let. What the total rental of such preserves may be we have not the data to show, but the aggregates of those here given are sufficiently impressive. Sixty-six deer forests are described, of which the aggregate annual rental specified amounts to £84,465, or \$410,500. There are 428 grouse moors, the rental of which sums up \$840,214. The mixed shootings number 296, with a total rental of \$383,262. Late autumn and winter shooting is advertised on fifty-eight preserves, the total rental of which is \$16,784. All these are in connection with houses, which range from castles to hunting lodges, and there are in addition 145 shooting privileges without houses, the total sum asked for which is \$133,816. Altogether the rents amount to \$1,786,383; and yet this is, as we have said, not by any means the measure of the total renting valuation of the preserves of Scotland. Take the deer forests for instance. We have not at hand data for computing the extent of the deer forest territory nor its valuation. Figures given not long ago by Lord Lovat estimated the number of deer forests in the Highlands at 110, covering 2,000,000 acres, with an annual rental value of £300,000; and it was estimated that during the thirty years preceding the date of this computation there had been spent on and about the forests the vast sum of £4,000,000.

While many of the most famous forests have been hunting preserves from time immemorial, or at least for centuries, vast tracts of territory in the Highlands now devoted to deer forests have supplanted what were in the early years of the century sheep pastures. The change has come about gradually, having been induced by the varying returns possible to be earned from the land as a sheep pasture or as a deer forest. Decrease in the price of mutton and wool, increased cost of wintering sheep, and on the other hand the growing numbers of hunters induced by improvement in firearms and a developed love of sport, with consequently more generous prices paid for hunting privileges—all these have had a steady influence in driving out the shepherds and supplanting them with foresters and keepers.

The rental of a deer forest is of course determined by supply and demand. The proprietor gets for it all he can induce the deer stalkers to pay. We find in the Badmington Library an interesting computation of the basis on which a Highland estate must be rented as a deer forest to make good to the proprietor the amount he might get for it if used in other ways. It is estimated that to produce a stag six years old—the age at which it is fit to be shot—300 acres are required, which would be worth for sheep and grouse £30. In addition to this possible revenue from his land for which he must provide in his rental for hunting purposes, there are various other expenses which the proprietor must meet, as for the maintenance of shooting lodges and foresters' houses, repair of roads and bridges, and the rent he must "lie out of" while the forest is stocking. All this does not leave a great margin of profit to the proprietor out of a rental which is based upon the rate of £40 per stag, the ordinary rent of forests in Scotland. As prices rule in these days, a Scottish deer forest brings to its proprietor a greater revenue than he could get from the land in any other way; and while the advantage or disadvantage of the system as to the Highlanders themselves has been argued

pro and con in Parliament and the press, and in pamphlets and bulky volumes, there is perhaps good reason to hold the opinion that the deer ranges are on the whole a benefit.

To rent a deer forest for the season does not mean simply to hire the privilege of shooting over so much territory; it means taking a country place which may be a castle or an extensive establishment of residence and appurtenances. Nor is the game confined to deer; there are likely to be grouse and salmon, the amounts of which the lessee is privileged to take being carefully stipulated. Here, for example, is a "great sporting domain, yielding about forty stags and 2,000 brace of grouse, with magnificent residence," the rent being £4,000 for the season. And here in detail is just what may be had in exchange for £3,000 for the season in Inverness-shire:

This magnificent forest extends to 32,000 acres, fully stocked with heavy and splendid deer, a great many being royals. Forest comprises some of the grandest and most picturesque scenery in the Highlands. Stags limited to 100, and hinds to 40. For several seasons by far the best average of any single forest in Scotland both as to the weight and quality of deer were obtained here. Besides deer, there are the usual varieties of Highland game. Most excellent trout fishing in lochs and streams, boats provided. The Lodge is without exception the most beautifully situated and handsomely furnished in the Highlands; contains three public, five bed rooms, one dressing room, bath room, three double servants' rooms, servants' hall, and office. The old Lodge, 200 yds. away, contains one public, five bed rooms, two servants' rooms, and offices, gillie's house. Stabling for nine horses. Coach house, kennels, and good vegetable garden. There is a hut in the forest, nine miles from the lodges, containing four rooms and three attic rooms. Rent asked, £3,000, including all upkeep, wages of four stalkers, taxes, etc.

This whole system of leased preserves in Great Britain is a business system conducted on business principles. The game supply is maintained as the farmer maintains his poultry stock; the privileges accorded to the lessee are definitely agreed upon, and are governed by the controlling principle that the parent stock, the capital must not be impaired. So many stags may be taken, so many hinds, so many birds, so many fish. Under such a system of exploitation the stock in trade is of assured permanence.

THE CARP NUISANCE.

If Mr. Palmer had not confined himself to the introduction of birds and quadrupeds, in his paper on the peril of bringing new species of animals into a country, he might have written a pertinent chapter on the German carp as it has been imported into America and placed in our waters. It is almost grotesque now to look back upon the enthusiasm and confidence with which advocates of the carp set themselves to the task of giving him free range in various States, and to compare this with the current complaints which come from many quarters that the fish is a nuisance which has ruined the streams for other and better varieties, and which is so firmly established that its eradication is beyond the ingenuity of our fisheries authorities.

The New York Fish Commission has recently received a petition from Walden, in Orange county, submitting that the Walkill River, which is one of the finest streams of water in the State and the leading stream in Orange and Ulster counties, and which formerly was noted for bass and other game fish, has of late been so infested with German carp that there is now only a remote possibility of catching a game fish of any kind. The complaint comes from Supervisor I. H. Loughran, of Montgomery. He says that the fish wallow in the mud like hogs and keep the waters roiled so that bass fishing is out of the question. He petitions the Commission to take some measure to exterminate the nuisance. What the Commissioners propose to do about it we do not know, nor what they might do. In ponds or small lakes which are capable of being drained the fish can be shoveled out as they were a few years ago in Passaic, N. J., but how they are to be cleared from a river is one of the fishing problems more than one fish commission would pay a round sum to have a solution of.

Nor does it help matters to be told that the carp is after all a good table fish if we only knew how to cook it. That may be quite true, and we are perfectly willing to concede it. But we never did assent to the proposition of exchanging our black bass for carp, or our ducking marshes for carp; and we are not willing to have the bargain thrust upon us. Now that the evil of the carp has

grown to such dimensions the State and National authorities should exhaust the fishcultural ingenuity of the day in the quest of remedial agencies. To declare that the carp must go is simple enough; to devise how it shall go is another thing.

THE TOILSOMENESS OF SPORT.

Now whatever could possess intelligent and usually sensible men to make martyrs of themselves and undergo hardship and suffering after the manner of Mr. Lewis Hopkins and his misguided companion in the "game of freeze out" of which the tale is told this week? These men had not lost any ducks for which they were compelled to make quest in zero weather; and if they had been ordered out by their country to undergo such winter rigors they would have thought themselves heroes and have made much of their display of patriotism. We heard a New York lawyer the other day describing with manifest satisfaction how he had trudged across New Foundland carries bearing his share of burden of camp duffle, and how at the end of the trip he was ready to fall down with fatigue. The closer we get to the sportsman, the fiercer the light we let in upon him in his woods retreat, the more shall we find him a fellow of infinite enjoyment of "hard lines." It seems as if sometimes he were almost actually perverse in making it hard for himself, when, as Nessmuk used to say, he might as well "go light" and have some comfort. For one thing there is the joy of the battle, the overcoming of difficulties, the mastery of obstacles, the enduring of strenuous wrestling with the opposition and the satisfaction of triumphing over it.

The toilsomeness of sport takes a multitude of forms, as there is a multitude of devotees of different tastes to court it and strive mightily with it. Now it is a duck hunter in the ice, now the canoeman poling the rapids, the oarsman bucking against wind and tide, the elk hunter cutting his pack-train way through down timber, the sheep stalker dragging his wearied limbs across the rock-slide, the July woodcock shooter fighting mosquitoes and dodging rattlers in a Pennsylvania swamp, the Mississippi bear hunter doing the very hardest "stunt" of his life in the canebrake, the Long Island trout fisherman in the icy water of opening day contracting the first trout of the season and a case of rheumatism warranted not to let go until his dying hour. In some one of these, or in some one of the scores of other exercises of what we call sport, you, good sir, who are a sportsman, have made test of the fascination and thralldom. By suffering and enduring and achieving you have won for yourself a place with the initiated; and well may you smile—though you may not speak—when you hear foolish talk of the effeminacy of sport and the laziness of sportsmen.

SNAP SHOTS.

Writing from St. Augustine, a correspondent tells us that the friends of the birds in Florida did not accomplish in the Legislature all that was sought for in the way of better protection for plume and song birds. Amendments were introduced going much further for the protection of birds which are not game than the provisions of the law finally enacted, but the House did not assent to these. However, Florida is gradually becoming educated, and there are many reasons why those who have given their endeavor to the cause of the song and plume birds should feel encouraged by the measure of success already achieved, and should keep up the good fight. A growing sentiment in their support may be counted on in the more settled districts, and all in good time the cows counties will follow.

The Christian County Hunting Club, of Tennessee, has been in continuous existence for forty-eight years, and the correspondent who tells us of it notes the remarkable fact that some of the charter members are still active participants in the camp hunts. This is an extremely long life for an association of men held together almost informally by the common interest its members have in an annual outing. Many a more pretentious organization, social and political, has run its course and been forgotten while this company of Tennessee hunters has maintained its life. What tales the oldest members might tell the youngest of the changed hunting conditions the half-century has wrought! Our compliments to the Christian County Hunting Club; may it live another half-century.

The Sportsman Tourist.

Pioneer Days.—IV.

Hermit Life in the Woods.

BY ROWLAND E. ROBINSON.

NEXT day they searched for a suitable site for their cabin, and found it, indicated by the choice of some former hunter's camp beside a little creek, with a convenient landing for boats, and yet out of sight of the main stream, though but a little way from it.

They at once set to felling trees for their house; cut the logs of proper length; hauled them to the spot; rolled them up; notched them and set them in place; cut a place for door and window; split and hewed puncheons for floor and roof, and in a few days had a substantial house, all the crevices warmly chinked with moss and clay; a stone fireplace at one end; a one-posted bedstead in a corner with a luxurious bed of marsh grass and cedar twigs, distilling aromatic fragrance and inviting dreamless sleep.

Pork barrel and meal barrel had their corner; there was a furnishing of rude table and stools, one for each and a third for a guest; hooks for the guns on the walls, and numerous wooden pegs, until at last everything was handy, comfortable and rudely homelike.

Josiah's day dreams added the presence of his fair-haired Chloe, and his heart beat quick at the thought of her longed-for coming. After the wooden hinged door was hung with wooden latch lifted from outside by a string, and a wooden shutter of the same sort was in place, a shed was built for the oxen, a stack of marsh hay made beside it for winter use, and the pioneers looked forward without apprehension to the coming of the dreary months of snow-bound solitude.

Now Josiah plied his axe to making a clearing, the log heaps were burned, the ashes stored for future potash-making, and a little rye scratched into the virgin soil for next year's crop. A thin fringe of the giant water maples was left along the shore dividing the three-acre clearing from the brown marsh through which the sluggish channel curved its amber waterway. Here toward nightfall came wonderful flights of water fowl, innumerable in countless flocks, making the air pulse with the vibrant whistle of pinions, and the splash and surge of alighting to feed and rest among the measureless acres of wildoats that bordered the channel. Then Kenelm would steal forth in the log canoe he had fashioned from one of His Majesty's pines, and fire a deadly shot into the unwary throng, whereupon followed a thunderous burst of up-rising, and as it subsided the echoes of the solitary discharge rippled out in far-off waves of sound, beating against distant hills and wooded shores.

Often a deer fell to his bullets, and once a mighty moose, wallowing in the marsh to the fringe of lily-pads, was waylaid and killed, furnishing a winter's supply of wild beef, which was smoked and dried and stored in the low loft.

Besides such service, Kenelm was tending his traps every day all along the two streams, and far back into the wild forest by blazed lines, where deadfalls were set for marten and fisher and bear, so that before the first snows fell to whiten the steel-blue helmet of Camel's Hump—Tahwah-be-de-e-wadso—or grizzle the pine-clad crest of nearer Charlotta, the cabin walls were lined with the appropriated coats of every fur-bearer, from panther, bear, wolf, fox, down to the humble mink and muskrat.

"They'll turn us aout-door, Josier," he said, as he took account of stock, "if I don't pack 'em aout tu the settlements when it comes snowhoin'." And with that object in view he began making snowshoes and toboggan, for he was skilled in all such Indian craft.

Josiah did not look forward to this period of loneliness with very cheerful anticipation; the lonely silent days when he should have no means of whiling away the slow hours but in cutting firewood, feeding the oxen and reading his two books, the Bible and "Pilgrim's Progress."

"Tain't nothin'," said Kenelm, "an' you'll be right as a trivet, an' jest take solid comfort o' life. Half a berril o' pork, an' as much meal, a chamber full o' jerked meat, an' a million acres o' firewood tu your door. I wouldn't ask no better, an' you can go in my place if you want to."

But the original plan seemed best, as Kenelm could best dispose of the peltry, and was the better woodsman for such a journey. So a little before Christmas he set forth on his snowshoes, hauling the toboggan load of choicest furs and provision of no-cake and jerked venison for the journey, and bearing a birch-bark letter to Chloe from her lover.

Betaking himself first to the frozen, snow-covered channel of Little Otter, then across to the Great Otter to Pangborn's, thence to the end of his journey by the Old Indian Road, whence in the bloody days of savage warfare many a marauding band of French and Indians had gone on its deadly errand, and returned with prisoners and plunder and ghastly trophies.

Josiah was not yet of the sort to take kindly to a solitary life, and the lonely days passed heavily, more heavily the long, lonely nights with no companionship but the fire and the leaping shadows it cast upon the corrugated walls, the image of a three-legged stool stretching across the floor, climbing the logs and snatching at the cross beams with his own shadowy figure leaping and falling beside it, till both seemed grotesque, uncanny goblins dancing to the crackle and roar of the fire until it burned low and they faded out, then sprang to fitful life when a charred brand briefly flared with an expiring flame.

When he covered the coals and crept into his blankets and all the room was in gloom but the dull ashen glow on the hearth, the cheerfulest sound was the muffled bursting of a smothered coal, or simmer of the sappy back log, or the faint clash of the stabled oxen's horns. With these were mingled the outer voices of the night; the sharp crack of the frost-strained trees, the moaning of the wind in the interminable forest, the boding hoot of an owl, the howl of a hungry wolf, the creak of the snow under the stealthy tread of some night prowler.

Once in the dead of a still night such a sound culminated in a scratching ascent of the jutting corner logs and the claws of the intruder tore at the puncheon roof, beneath

which hung a saddle of frozen venison. Then the stealthy footfalls crunched toward the chimney, were heard climbing it, and then long-drawn sniffs came muffled down its hollow. Josiah sprang from his bed, drew from it an armful of straw, hastily raked open the coals and threw it upon them. There was a puff of smoke, an upburst of flame to the chimney top, a gasping hiss of fright and menace, a scream of rage, a headlong plunge into the snow, and long-receding leaps fading into the silence, leaving nothing behind but an odor of singed hair. After that an armful of marsh hay was laid ready every night for a similar emergency.

Besides the time given to providing firewood, Josiah spent much of it in hollowing out sap troughs and making spouts for the coming spring sugar making, and perfected himself in the art of snowshoe weaving, that he had learned of his comrade, and also practiced the art of wearing them. He made splint brooms of birch, and wooden bowls and spoons, and had pleasant fancies of the commendation his handiwork would receive from Chloe when she came to see it. At times he was oppressed by fearful forebodings of mortal sickness and lonely death, and pictured to himself the horror of his returning comrade at finding him stiff and stark in the cold and desolate cabin. On such occasions of foreboding he found more comfort in his Bible than he had ever thought possible, and he made a vague resolution of joining Chloe's church when the opportunity was given him. Besides the comfort the one book gave, he found great lightening of weariness and loneliness in both volumes, and wished for but one other, and that was "Robinson Crusoe," in whose adventures and lonely life he imagined parallels to his own experience.

Once his next-door neighbor, Pangborn, and his son came to visit him, spending the night and part of the next day with him, and giving him some very old news from the southern settlements. The care of the oxen prevented his returning the neighborly call, which, if it enforced the sense of loneliness, also made him feel that he was not quite forsaken by his kind.

So the weeks passed until six were gone, and then one day when the frozen lake was booming its plaint of long imprisonment, he heard a faint but nearer and less supernatural voice upon the creek, and looking out saw his home-coming friend briskly shuffling toward him on his snowshoes, trailing the well-laden toboggan behind him. There was great rejoicing and unfolding of news, and delivering of messages from friends; a brief, unsatisfying, complaining letter from Chloe, and consequent doubt and misgiving—not lessened when Kenelm said solemnly, "You don't want to set your heart to much on women folks, 'cause they're all more deceivin' 'an the wind that blows. I know 'em all through, an' they can't fool me no more."

"You don't mean Chloe?"

"I don't mean her no more 'n the rest on 'em—they've all got to be right 'n under your eye to be sure on 'em," Kenelm responded bitterly, and continued, "The Widder Ballau give me her word afore we come away last fall, an' wha' d' ye think? Wal, sir, I found her merried tu ol' Deacon Wetherbee when I got back. She must ha' took up wi' him afore we was out o' sight on the road. But she's the last!"

He began unpacking the tea, coffee and sugar he had brought, and reported a handsome sum of money deposited in the Hartford bank from the sale of the fur. Josiah was disheartened, for he felt sure his love affair was going wrong, yet scorned to ask questions which showed lack of faith. He was glad when spring and sugar making came to keep his hands busier and his thoughts from brooding on Chloe.

A Game of Freeze-Out.

THAT is what Jack called it, and I guess the name fits. We went after ducks, and might have done some good had our powder not frozen up. The railroad is not far distant from the beautiful Nolachucky River, where it flows near the historic town of Greenville, Tenn., and at that point Jack White met me one winter day with duck boat and boatman, guns and shells, and other implements incident and necessary to a two or three days' duck run.

After trying all other methods, I unhesitatingly pronounce the method of duck hunting in vogue down here the most delightful and least laborious of any.

Our boats are stanch, but light, and are cut in two in the middle for convenience in transporting. Two gunners and a boatman make a complete party. When there is a tide or freshet in the early winter is the time to go.

Sitting side by side on the middle seat, the boatman propelling and steering from the rear, running from three to six miles per hour, close in to the bank, where the numerous crooks and turns permit near approach before the ducks flush, then the sport is of the highest order. A small foot stove, heated by charcoal, keeps the feet warm, and clothing and enthusiasm (in our ordinary weather) do the rest. Jack and I were bachelors when this hunt occurred, and therefore have never been accorded the sympathy that rightly belongs to men who have passed through the perils that we braved on that memorable occasion. Realizing that it is a little late in the season for a cold-day story, I hope FOREST AND STREAM may find this useful on a very warm day, in order that the contrast may add to the interest—like an artist friend who fills his house with winter scenes in summer and vice versa.

Coming from the "effete East," where business had called me, softened by steam heat and parlor-car service, I met the tempter, as aforesaid, expressed my bag and overcoat home, and clothed light, so as to improve my shooting, began the hunt that stands forth very prominently amid the hill country of memory.

There is no necessity of reference to notes to detail the facts relating thereto; a mental brand is as lasting when frozen as when burned in.

We walked about town an hour or so before turning in, and Jack made an investment that made him the object of my most sarcastic ridicule, for the evening, and bitterest envy for the next two days.

It was a lumberman's shirt—red, rough and warm. Had it been a thousand-dollar sable, it could not have

felt better than it did fifteen hours later, when a sleeve of it filled with a strong arm around my neck steadied me as, frozen almost stiff, I was helped from the boat up a steep bank to a roaring log fire in a hospitable farmhouse, walking, as I seemed to be, on a pair of borrowed legs, and they a very poor misfit.

It was cold when we started, and "it grew, it grew; listen to my tale of woe."

By 11 o'clock in the forenoon the mercury was too low to classify, or associate with, and we were making for the roaring fire aforesaid. A single duck and one pair had been the total flush for the morning. The single we killed or else it was as Jack said, "It froze and fell dead when it flew high enough for the wind to fairly hit it." At any rate, we got it. The pair was missed—"undershot" by the same authority, "for I saw the icicles cut from their feet," said he.

Coffee and sausage, ad. lib., with an hour of the good fire revived us sufficiently to tempt us to resume, in spite of the protests of our host, who was a humane and hospitable gentleman. The afternoon was several degrees worse than the taste we had already had, as the wind had increased to a gale. The spray was blowing over us by 3 o'clock and every drop that struck froze fast. Ducks and everything else that could fly and had either sense or instinct, had sought a more salubrious clime, and we didn't care. The object of our quest changed entirely, and a comfortable house, with a good wood supply, was all the sport that we wanted. We had laid aside our guns, and were both wielding paddles, for the double purpose of hurrying to shelter and the warming exercise, when we rounded a point and ran into a fine flock of mallards, huddled close up to the bank in under the willows. There was a wild scramble for guns as the ducks dashed out and took to flight.

My excitable friend threw his paddle overboard, kicked the stove over, and proceeded to work his pump gun in the general direction of the duck flight. Dropping the gun that I had half raised, I laid to with the bailer to extinguish the incipient conflagration that the overturned stove had started in the well-tarred bottom of our boat. When the excitement had subsided we recovered the paddle, and a pair of ducks, but the fire was gone beyond recall. The only warm event in that afternoon was the conversation immediately following, I suggesting to Jack that he should not try to kick ducks to death when he had come shooting, and he assuring me that if I could not shoot ducks it was only fair that I did not drown him while he was doing so.

A half hour more steady paddling, with our feet on the cake of ice that quickly formed in the bottom of the boat where the water had been thrown, brought us to a house on the bank. A man came shivering forth to answer our hail, who "lowed as how we mou't git the ole woman to let us stay all night."

Landing the boat we left the river, which was now running full of loose ice, and stumbled up the bank to the house. The "ole woman" had some dozen objections, and half dozen children, but all combined could not overcome our insistence, after we had gotten a glimpse of the fire that burned brightly in the big fireplace. Long separated brothers could not have been more affectionate than we were, crowded close together in a narrow bed in the "other room" through the long hours of that cold night, during which the mercury continued to retrograde.

The good woman had given us a supply of water in her glass pitcher, evidently the pride of her heart, and enjoined upon us particularly not to leave any of it standing therein over night, "as it would sure freeze and bust the pitcher."

Hurrying to seek the warmth that we hoped to find under the cover, we left that fated pitcher half full of water sitting on the table by the thin board wall, whose cracks gave ample opportunity for the elements to do their worst. Before our congealed blood had shown more than faint symptoms of resuming its normal flow sounds of suffering began to emanate from the doomed pitcher. Reminding each other of our dereliction to duty, and each assuring the other that we ought to arise and rescue the treasure, we burrowed down deeper under the cover and waited, hoping for the best, but fearing the worst.

In the morning we threw out of the window the solid contents of the shattered idol, and sorrowfully arranged its remains in an artistic heap over a silver dollar, hoping that its successor might be to the entire satisfaction of its erstwhile admiring owner.

When we sought our boat we found it frozen fast in the ice, although the channel was yet open. Breaking it loose, we poled and broke our way out to open water and resumed our trip. Another full day's run had to be made before we could reach a point where we could haul to the railroad. We found four more ducks during the day, that our boatman said had evidently deliberately sought self-destruction by remaining exposed to the awful weather, instead of going on south, and these we killed as an act of mercy.

That night, so frozen and miserable that a dog would have slept out on the top of his kennel to shelter us, we tied up near a large and prosperous farmhouse, and sought its owner, where he was making comfortable his stock at the barn. If that fellow has since that time gotten his deserts, he is suffering more than we did then, and from the reverse element.

"Been huntin' ducks on the river an' purty nigh froze, eh? Well, I should think so. No, I can't take ye in for the night, nor for no other time; don't know ye, nor nothin' about ye," and he resumed his interrupted labors. Near by was another house, much less pretentious, but with an air of comfort about it that made us homesick. Making our way there, we found it the home of a noble, big-hearted young gentleman—a fellow sportsman—who, with his charming young wife, gave us a hearty welcome. Our trials and sufferings were fully sympathized with, and every comfort was most hospitably extended.

The next morning a team was secured to take us to the railroad, eight miles away. Loading into the wagon our boat and baggage, we bid our kind host and hostess farewell, and started on the last stage of this eventful trip.

Jack climbed into the wagon and declared his intention to ride until he froze out.

The pair of young mules that furnished the motive power

had been in the stable for three or four days, and were full of go. On the first good long down-grade stretch of road they proceeded to "turn themselves loose," as the driver expressed it, and shake up things until they started every seam in the boat. Jack held on bravely for half the distance, and then came out over the tail gate like a flying squirrel, alighting on the frozen road in a heap and rolling after the wagon for 30 or 40 ft., giving his entire anatomy a fair chance for bruises without the slightest show of partiality. He was neither happy nor comfortable when we overtook him, but his fine flight of vehement oratory in describing the conduct of the untamed steeds indicated that he was at least warm once more.

His peroration, as he rubbed the largest contusion on his head, with one hand, and sought to free his garments from the accumulated dust of the road with the other, was to the effect that "he had rather sail the stormy seas with an ice floe for a ship than ride behind a pair of fool mules with ambitions to make records." Every experience teaches more or less wisdom, and this episode was no exception.

Jack walked the rest of the way, as he should have done, but there was a pronounced impediment in his gait. The special providence that is said to watch over fools and bad boys brought us safely home at last, and our dreary old dens looked like paradise after the awful experience we had passed through.

Aside from the fact that no ordinary fire satisfied us the entire winter through, we had, strange to say, suffered no great amount of lasting harm from the exposure, and at the next opportunity we went again, which is "another story."

LEWIS HOPKINS.

Making Acquaintance.

Editor Forest and Stream:

One of the first things that an old hunter does when he moves into a strange community is to size up his neighbors for signs of good fellowship, and if he is fortunate enough to discover a well-kept dog here and there he knows he is all right, for he rightly judges that he who has a fondness for dogs is a good man to tie to, while, on the other hand, the man who despises a dog is a good man to stay away from.

Jim B— lately moved from a suburban town to a suburb of the city.

When he and his wife started out on their house-hunting expedition there was a conflict of ideas between them as to location, convenience and comfort. He wanted a spacious yard, with roomy outbuildings and a house with an isolated room that he could fit up for a snuggery, where he could keep his books, guns and paraphernalia in as much disorder as he pleased—where he could be boss and let his dog lie on the floor, if it suited him—to all of which his wife made little objection; but she insisted on having her own way in certain things that a woman knows more about than a man, and with a view to find as nearly as possible what both wanted, they spent many weary days of searching, until they found a place which, though not up to the requirements, was a sort of compromise; and as they stood viewing it after the decision was made, Mrs. B., with a sigh of relief, remarked that "the house was neat in appearance, and such a lovely yard for a flower garden."

"Yes, and such a nice place for a dog to run in," replied Jim.

"Oh, I believe you think of nothing but that nasty dog; but I won't have him tracking up my walks and porches, and you'll have to keep him chained in that shed you think will make such a nice kennel." All of which made Jim smile, for he knew that his wife liked the dog as much as he did, and she also liked Jim, but possessed that womanly tact of bossing a man around that commands obedience without any feeling of humility, and he promised to keep the dog chained—sometimes.

As time works wonders, it soon brought relief from the strain of settling down, and when the last carpet-tack had been driven, pictures hung and things brought to rights generally, Jim began to take his bearings. Thus far he had not seen enough of the "men folks" to judge of their congeniality, nor any dogs except on either side a silky, long-haired lap poodle, which puzzled him to guess which end the head was on, and when, one day, one of them fell off the steps, and he heard the murmured "tootsy wootsy" compassion of its mistress, he concluded that so far as that side was concerned he need look for no bond of sympathy. But, what does he see? Two handsome English setters coming up the street, followed by a man, and that man the husband of the woman who was bemoaning the accident to her pet. When the gate was opened and the two setters bounded up the steps, greeted by the vigorous barking and joy of the poodle, who was not hurt at all, the transformation was complete, and Jim said to himself, "That man's all right, and I must make his acquaintance." Less than a week afterward Jim's dog was frolicking with his neighbors, and the two masters were blowing smoke at each other across the back fence. Jim's neighbor was short of stature and broad of girth. His face was jolly and he smoked good tobacco, a fact which came to Jim's knowledge when his pipe was smoked out and his neighbor forced his pouch upon him to refill it. When he returned the pouch and had passed upon the quality of its contents, his neighbor remarked: "I am an inveterate smoker; it is one of my comforts, and does me no harm. If there is anything that will cement the bond of good feeling between congenial spirits it is a companionable smoke. When I am hunting my pipe is as necessary to me as my ammunition, and I think that the hunter who does not smoke misses a good thing in an outing. When lunch time comes, the best part of it is the smoke that follows."

"I think as you do," said Jim, "and besides the comfort of a good smoke and siesta at noontime, I find pleasure in taking observations. If it is a familiar spot, I note the changes that have taken place since my last visit. Old trees have fallen, to take the places of old logs decayed, and new trees have sprouted. The ravages of time and weather have given a general, if slight, change to the appearance of everything. I may also note the spot where I dropped a grouse on some previous visit, and the memory serves to occupy my thoughts for a time. Then I talk to my dog, and his happy, intelligent look is sufficient answer to all that I may say

to him. And my gun, too, comes in for a share of admiration. I contemplate the symmetry of its proportions and the beauty of the engraving on its locks, and bring it to my eye, because it is natural to do so. I imagine how easy I could drop another grouse in the same place if one should spring up then. An evanescent odor of dead leaves and rotten wood that might be offensive at home seems pleasant here, and there is such a fascination about the place that I am loath to leave it. All this may seem like gushy sentimentalism to an unappreciative person; but it is my hobby and affords me pleasure. In fact, a man without a hobby of some kind loses a good deal of the best part of life."

"We seem to have many feelings in common," said the neighbor. I frequently overhaul my outfit, not because it requires attention, but because there is satisfaction in doing it. A sportsman is much like an overgrown boy, and his outfit his playthings. He will have many things in it that he will never make use of, but he gets them because they strike his fancy when he sees them, and he finds satisfaction in handling them and imagining what a convenience they will be if needed. I suppose I already have more loaded cartridges than I shall use in several seasons, but I am still loading more because I like to do it, like the boy who never wearies of doing a thing over and over again, which to us might seem like useless occupation; yet we once found amusement in doing the same things."

"All work and no play makes Jack a dull boy," said Jim. "I hope you will find it agreeable to go hunting with me this fall. I have several places to go where we will find royal entertainment among my farmer friends. In the meantime, I wish you would come over to my house and rummage among my things. I have books, relics and a wheelbarrow of other things that I think will interest you."

"It will be very agreeable, I'm sure, provided that you will also go with me to some of my resorts, and—"

Just then feminine voices were heard coming through the back door, as the two wives were approaching, Jim's wife being the last: "It will be too lovely for anything—cut bias and trimmed with—my goodness! There's my man talking to yours, and I'll bet all he's talking about is guns and dogs."

"No, we were only discussing new bonnets and gored skirts," lied Jim. "Is supper ready?"

J. S. B.

PITTSBURG, Pa.

June Prospects.

CACHE COUNTY, Utah, lies on the Idaho boundary of the State. It is divided longitudinally by Bear River, which, with its tributary streams, affords the best of trout fishing in season. The trout and a few deer in the hills are all that there is to protect, and up to date protection has been decidedly scant. Last week the fish and game warden of Cache arrested and secured the conviction of a lad for trouting out of season. This so surprised and pleased the county commissioners that they raised the warden's salary from \$20 to \$30 per month. Henceforward the warden will devote himself more assiduously to his official duties and pay less attention to dry-farming and fruit-growing in a region where the fruit is frost-nipped in June.

It was a great relief to come from the icy plateau of Cache to the sunny land of market gardens between Ogden and the great Salt Lake. Heretofore I had supposed the region west of Ogden to be principally salt marsh, but it is very different. It reminded me much of the market garden parts of Long Island or of New Jersey between the Passaic and the Hackensack rivers. The soil is a sandy loam streaked with alkaline clay strips, the latter being devoted to alfalfa or to pasturage. Natural sloughs abound, and in these the water is only slightly brackish. These carry off the surplus water of irrigation, and are an important factor in the leaching out of the "saleratus" that permeates to a certain extent all the soils of the old Bonneville basin.

In the swamp grasses that border the sloughs, the Limicolæ have their Garden of Eden. Last Sunday I devoted to ornithology. The friend with whom I spent the day drove me some three miles to show the beauties of the land—the asparagus and green peas and ripening strawberries, and the less developed but none the less attractive artichokes, cauliflower and brussels sprouts. While he expatiated on these things, I was noting down Bullock's oriole, hummingbirds and especially one tern (silvery and with the top of the head black) that poised over a little brook and darted downward and dived and devoured minnows for my individual benefit. We left the buggy and walked across a potato patch, planted on a genuine sand knoll. Suddenly I was aware of a couple of kildeer running before us and endeavoring to attract our attention. When we would not be attracted they came back and circled about us. I could not understand their actions until we almost stumbled over two nests, right in the row between a couple of diminutive potato plants. The nests were simply little hollows scooped out of the sand, and the brown, speckled, conical eggs were all placed point downward.

"If you are interested in birds," said my friend, "I can show you a sight when you get back to the house."

He was right. No sooner was the horse stabled than we walked out through the currant patch, scarce 50 yds. from the kitchen door, and came abruptly upon a little slough that widened in the level ground into a shallow carex-grown marsh, freckled here and there with patches of glistening sand. Never had I beheld such a picture. There were a few ducks in pairs, mostly greenhead and teal, but the waders, the typical shore birds, were innumerable. How I wanted my Cones or Ridgeway. They well knew that they were not only protected by law, but that their visitors were perfectly harmless, so I had every opportunity for close observation. Phalaropes, snipe, plover, avocets, curlews, were all in evidence, and the dunes were fairly dotted with noisy sandpipers. I only hope that the avifaunal exposition will be in full blast in the autumn. I saw here many species that I did not know were to be found in the intermountain region. Jack-snipe predominated, and the bird here called the "black-snipe" (a little larger than golden plover) made a good second. Among the snipe nesting was the order of the day, but most of the ducklings are hatched. Of course

the region is beyond compare for hawks and muskrats.

My next move was southward into the vicinity of Utah Lake and its tributary rivers. The season has been unusually backward, and upon the higher ranges snow has scarcely begun to melt, and high water cannot be expected for a couple of weeks yet. This means only poor fishing at the opening of the season (June 15), but the indications are that during the summer it will be better than usual.

Doves (a game bird under the new law) are through nesting, and are bunching for their annual campaign upon the grain fields. They may bunch in safety for three more weeks—then look out. Chickens and grouse, owing to late storms and severe weather, do not give as good promise as they generally do at this time.

Game warden Newell is having considerable trouble with the Telluride Power and Transmission Company, over their power plant dam in Provo River. Being a foreign corporation and having no interest in the country save for what money they can take out of it, they have determined to ignore the "fishway" section of the law. Their dam is quite high, and last year they made no provision for the passage of trout up to the spawning grounds. As a result, the best of the trout became exhausted in trying to leap the dam, fell back disabled among the rocks, and floated helpless down the stream. It is no exaggeration to say that, during the height of the run, a wagon load of fish were ruined in this way every day. One farmer told the Commissioner that he picked from the head of an irrigating ditch sixteen large and helpless trout in a single hour. This year the company has put in a fishway on the "fall and pool" plan, but it is not adequate to the exigencies of the case, and the Commissioner refuses to accept it. The soulless corporation refuses to make the necessary modifications, and there the matter rests so far as Utah county is concerned. But Wasatch county, higher up the river, has been deprived by the dam of its trout fishing, and it proposes to make a test case. In the meantime, the Telluride Company may learn that a charge of dynamite well placed is far more expensive than a proper fishway.

I shall not have an opportunity this year to grumble at the lawbreakers who have been dynamiting and weiring the trout out of Strawberry, and peddling trout in the mining camps a month before the season opened. The Indian agent at Ft. Duchesne has put the Strawberry country (Uintah Reservation) in charge of the Indian police, and poachers will find little grace in their eyes—for which Heaven be praised.

Provo, Utah, June 9.

Red Lights and Juniper Greens.

Editor Forest and Stream:

Accept thanks for memoranda clipped from your issue of Dec. 6, 1896, regarding the so-called "stump" bear, though I am not familiar with the term as applied. I recall the interest I experienced in reading the same at the time of publication, especially in respect to the individual variations mentioned in the Ursidæ family, as designated under the modern system of differentiation, though I had already added at least three to Dr. Merriam's elongated list of thirteen or more—there being twenty years ago not more than three recognized species as you state. And I had previously in your columns in a series of letters entitled "Winter Sports in North Carolina," treated incidentally of the same old stump bear (so-called), under the name of *Sinnaker*, by which name alone he is locally known in Hyde county, where the natives are said never to shave or to own a mirror. By these simple but thoroughbred backwoodsmen, he is regarded as a man-eater as well as a cattle-killer, and as distinct from the ordinary hog bears and cattle bears of that wilderness district as is the man eating tiger of India from its kind; perhaps more so, because of physical characteristics, particularly the distinguishing white spot, as big as one's hand, which invariably marks its breast. This totem is as unique in zoological annals as the mark on Cain's forehead, which stamped him as a murderer!

The sinnaker is the only bear I ever heard of which relishes human flesh and systematically hunts for it when he cannot get other food. But I have never heard him called a stump bear; though I am sure of having read somewhere, perhaps in the FOREST AND STREAM, of a plausible explanation of the cognomen. Reckon it is a paraphrase for swamp bear, which is more appropriate. However, as there is a good deal of timber cutting in all Southern swamps, especially of white cedar (locally, juniper) and cypress, these bad bears, lying low in wait for a mouthful of African logger casually passing, might readily be mistaken for the stumps which concealed them; just as stumps have been mistaken for bears by school children from time immemorial.

By the way, I fancy I can impart some interesting and perhaps novel facts in this connection, about logging and milling in these juniper greens, as the timber tracts are called, which cover at least three-fifths of the intersound peninsula which lies between Albermarle and Pamlico Sounds, and embraces the counties of Beaufort, Tyrell, Washington and Hyde. The geographical center and crown of this expansive area is occupied by Lakes Pongo and Phelps, which are phenomenal bodies of water like Lake Drummond in the Dismal Swamp, out of which flow numerous streams with an ample fall for mill power, say from 7 to 18 ft. Artificial canals connect these lakes with the sounds, and give access to small sailing vessels which are employed in shipping the products of the interior farms. The principal operator in this region is Capt. John L. Roper, of Norfolk, Va., from whom the lumber town of Roper, in Washington county, is named. In all its features it is almost the counterpart of a Minnesota or Wisconsin lumber town of fifteen years' growth, with neatly-painted houses of the modern class, five churches, a line of stores and warehouses, graded and lighted streets, sidewalks, and two sawmills with an output of 100,000 ft. of lumber per day. The population is about 800, and as thrifty and full of push as any Northern community. Between the towns of Roper and Pongo, twelve miles distant, six tramways penetrate as far as seven miles into the juniper and cypress swamps, where camps of negro immunes defy mosquitoes and malaria, and manufacture first quality shingle by hand. They

live in hovels contrived of rough boards and juniper bark, which stand about 6in. above the surrounding water on the sawed-off stumps of trees which have been felled. There is no terra firma, and no ground to stand on except a narrow platform in front of each door, from which perch and bream can be caught when needed for a meal. Pots and kettles are set on tubs filled with sand, where a small fire is built. Often in cold weather the tenants build rousing fires inside, and camps have been known to burn up, in spite of the water, all around them. The tramways are operated by mule power, and when the flat cars go into the woods, the animals traverse an intermediate plank between the wooden rails; but as there are no siding, turn tables, or platforms at the end of the track, and only water space to stand on, the mules just jump the tracks in order to reverse for the return trips. In the course of time they become quite expert in this feat, and get into position without waiting for orders. Good sheds are provided for them, with plenty of prog; and in these respects they fare far better than the men.

In these somber swamps the "juniper greens," dense with foliage, alternate with "reed lights," which are known in most localities as canebrakes, or slashes; and I have more than once experienced a joyous relief upon emerging from the cheerless monotony of the timber into these grateful open spaces of many acres in extent, where the sun falls unintercepted by branches, or foliage of any sort. So that, to my sensibility, no designation can be more appropriate than "reed lights," which are indeed a light in the darkness, and very grateful to the eye. Interspersed throughout the broad expanse of wilderness are "oak islands" and "pine hamiks" of dry soil, like those of the Florida everglades. (Don't say hammocks, or hummocks. Hamik is the original Seminole vernacular, and is correct.) Bear trails cross these patches of cane from forest to forest; and in parts of the country which have been drained and cultivated, and planted in corn, with fields of the succulent stalks and roasting ears interspersed throughout, the bears of whatever class or designation have advantages in the way of forage such as are enjoyed nowhere else in the world, and the stump bear has as "good a show as any of them."

CHARLES HALLOCK.

Natural History.

In the Olympics.

WE have received from the Field Columbian Museum of Chicago the report of D. G. Elliot, F. R. S. E., of the expedition made last season to the Olympic Mountains, Washington. The story of the trip gives an excellent picture of mountain wilderness travel with a pack train, and we transfer it for the benefit of the FOREST AND STREAM's public:

The expedition to the Olympic Mountains, authorized by the Executive Committee of the Field Columbian Museum, left Chicago on the 16th of July, 1898, going via Seattle to Port Angeles, on the Straits of Fuca. At Port Angeles most of the outfitting was accomplished, and on the 24th of July, the pack train, consisting of nine horses, carrying our camp equipage, and conducted by six men, left the town, and started on the journey into the interior of the mountains, which loomed grand and massive before us, their rugged sides and towering peaks, many of them crowned with snow, shadowed in the clear waters of the sea that washed the shore at their feet. The first day we only traveled about ten miles, along a well-made road, that is intended eventually to reach Lakes Southerland and Crescent, the most important bodies of fresh water in this remote corner of Washington. From our camp, known as MacDonald's Ranch, there was only a narrow trail running along the eastern bank of the Elwah River, which rushes and boils with a wonderful rapidity and force in its headlong march to the sea. The trail by no means keeps near to the stream, but mounts occasionally several hundred feet above it, and one, from these heights can look down, almost perpendicularly at times, through the forest of mighty trees, and catch here and there amid the foliage, glimpses of the foam-covered, troubled waters.

Our difficulties of the march commenced at the beginning, for one of the horses, while attempting to pass a slippery spot on the trail, missed his footing, and rolled with his pack some 50ft. into the valley below. He struck on his back with a force that awoke all the echoes of the mountains, and we hastened to where he had fallen, expecting to meet only a mangled body, instead of which we found he had struggled to his feet and was yawning mightily as if he had just awoke from a sound sleep. He had struck squarely on his back, and as he happened to be carrying the bedding, the soft blankets, etc., had saved him probably from instant death. As it was, he escaped with the loss of one eye, which had struck on a root as he reached the ground. We camped that evening at a deserted ranch, owned by a Swede by the name of Johnson, who, suffering from an attack of gold fever, had gone to the Klondike. The camp was on the bank of the river, about 10ft. higher than the water, and a short distance above a cañon. This was about 100ft. wide, with perpendicular walls, between which the river tore along with irresistible strength. In the spring, during floods, huge trees, perhaps 30ft. in circumference, are hurled through this gorge with the power of a catapult, and in a crevasse of the rocks one old forest monarch has been wedged by the power of the furious river, 20ft. above its ordinary level. We remained in this camp a week, and obtained a large number of desirable mammals.

Our route from here was across the river, and at the end of the week the water had fallen sufficiently to permit our horses to cross at a ford a short distance above our present position. Two miles above, on the western bank, we camped near the mouth of a brawling stream that tore down the valley, coming from far in the mountains, and was lost in the rushing Elwah. From this point there was no trail, and for the next ten days the men were busy cutting a path through the forest on the mountain sides, until they reached a height where the trees became fewer, and then gradually disappeared at timber line. We were trying to reach the country where the elk were accustomed to pass the summer, just be-

neath the everlasting snow of the higher range. The forest was primeval, and the individual trees gigantic, many mounting upward for 150ft., perhaps more, without a branch, a massive trunk rising in the air straight as a needle. These magnificent cedars are characteristic of the northwestern forests, and are very impressive from their enormous size. The journey up this trail was a very rough one—hard on men and horses. Two of these the first day indulged in some somersaults, which, fortunately, did no damage to them or their loads, and we eventually arrived at a small pond named Happy Lake, a view of which is here given, and camped. The trail, however, had been so steep, exactly like crawling up one side of a peaked roof, that the loads on the horses had to be materially reduced, as it was impossible for them to climb heavily loaded as they were, and it was several days before all our impedimenta was gathered into camp. We were now at a height of something between 5,000 and 6,000ft.; my aneroid gave 5,300; but I think it underrated the elevation, as I had noticed it was not so accurate when tested with known heights, as it had originally been. Our first camp was near the borders of Happy Lake, but the mosquitoes were so numerous and extra ferocious that we were obliged next morning to move to a locality about three-quarters of a mile away, where a level place sufficiently large was found, on which to pitch our tents. This was not by any means an unusual occurrence in our journeying through these mountains. They were so exceedingly steep, and their sides so broken up by ravines, landslides, and every kind of obstruction inimical to level ground and peaceful progress, that places suitable as sites for tents were not easy to find. The accompanying views give a very good idea of the appearance of Happy Lake, and of the first location of our camp in the vicinity. Some elk signs had been seen in our wandering about the neighboring "hog-backs" and peaks, and in one spot was plainly visible, where four of the animals, affrighted at some object or sound, had dashed down the almost perpendicular side of the mountain into the depths below. So steep was this descent that none of us would have dared to attempt it, but fear may at times carry animals in safety through perils, which if dared in cold blood would have probably caused their destruction.

We were nearly three weeks at this camp, during which time we were engaged cutting a trail further into the mountains, and hunting and exploring their valleys and summits. Flowers of all kinds and hues were blooming in profusion about us, and certain tracts were a mass of one solid brilliant color, as though laid out by the hand of some skillful gardener. Our tents were pitched on the edge of a ravine, at the bottom of which flowed the waters of Happy Lake on their way to the sea, and across this and over the ridge of the Storm King range, rising above Lake Crescent, we could see on a clear day the waters of Fuca Straits, with the ships sailing from or to the Pacific, and the island of Vancouver beyond, with its surface broken by hills and high mountain ranges. South of the camp rose a lofty "hog-back," from whose crest could be obtained a fine view to the north and south. This ridge terminated in a steep peak toward the west, from which one looked down into the yawning depths beneath.

Nothing is gradual in these mountains, extremes are always present. Everything seems to stand on one end like the trees, and the soil is only kept from tumbling into the valleys by the rocks, which seem every moment about to lose their hold and dash into the abysses below them. Looking south from this "hog-back," across the intervening valleys, through one of which flowed the waters of the creek, known as Boulder, and which emptied into the Elwah, near our second camp on that stream, could be seen the north wall of the central snow range, rising perpendicularly from the valley, and inaccessible from that side by even a goat. Its summit was broken by many a yawning chasm of unknown depths, and on whose brink no foot of man had ever trod, with craters of extinct volcanoes opening their great mouths to the sky and disclosing their smooth interior walls going sheer down for hundreds of feet until hidden in the depths, or disappearing in the snowdrifts that filled the interior two-thirds to the crater's lip. In one of the strolls around camp Mr. Akeley, who took all the views that illustrate this paper, found a squirrel asleep on a log, and after getting the proper focus, he awoke the little fellow, who, disgusted at being disturbed in his nap, began to swear at his tormentor in the most vociferous and reprehensible manner. While in this excited condition his portrait was taken, as shown in the accompanying view.

The trees at this altitude were black spruce, hemlock and firs, giving a somber and lonely appearance to the landscape. The spruce grew in clumps of six or eight, ranged generally in a circle, their branches sweeping the ground, and affording in their midst a good shelter from the wind and rain, but they were good for very little else. Although we hunted continually, no elk were seen while we remained at this camp, and deer, the true black-tail (*O. hemionus. Rafin.*), the only species found in these mountains, were very scarce, and we only succeeded in obtaining a doe and a fawn. But our collection increased considerably, although the variety was not great. I do not think I was ever before in a country that was apparently so devoid of animal life. One might walk for days and see nothing save a squirrel, chipmunk, or bluejay, and only occasionally be challenged from the higher peaks by some watchful marmot, whose shrill whistle awoke the echoes around, as he expressed his disgust at the intrusion of an inquisitive and troublesome biped. Not far from our tents, measured by distance, but exceedingly far off when the climb back was considered, for it was situated deep down in a valley by a running stream, was a colony of the unique Sewellel, a species that seems to have lingered beyond its time on the earth, and known to the people as mountain beaver or farmers, though seldom had any one seen the animal. An account of its queer appearance and strange habits is given in the proper place in the catalogue of mammals included in this paper.

By the newly-cut trail along the "hog-back" and through the forest which covered portions of the route, we made our way to our next camp, further in the mountains and nearer to the forbidding north wall of the main snow range. We overlooked a small lake lying deep

down in a hollow, known to us as Boulder Lake, and whose waters, plunging down a precipitous cliff at the outlet, formed the creek that terminated at the Elwah River. The cliffs were covered with loose stones and sand, and were in all but a few places impossible to climb. The summits on the south of this lake were so broken by jagged ridges, impassable ravines, snowfields of uncertain depths and yawning chasms, that progress in any direction was out of the question.

It was soon ascertained that it would be impossible to go further south, either with horses or men, and as elk seemed to be exceedingly scarce in the locality, I desired to cross, if possible, the intervening range to the west and strike the headwaters of the Solduck, a river of similar character to the Elwah, but smaller, and which emptied into the Pacific Ocean. Mr. Akeley and two men made a day's trip to see what could be done, and reached the second ridge to the westward. They found five lakes, one of which they named Elliot Lake. It lies well toward the snow range, deep down amid the mountains, and is square in shape, quite different in this respect from all the other bodies of water, which are either oval or round. Elliot Lake is, perhaps, about one-third of a mile in length, of great depth apparently, and probably occupies a small crater of some extinct volcano. From its isolated and almost unapproachable position it will probably never become a summer resort for tourists, nor is it likely that many persons will ever gaze upon its quiet waters. The "hog-backs" in many places were so sharp that it was necessary to place one foot on each side of the ridge and so shuffle along, while the perpendicular sides shot down below many hundred feet, and the slightest stumble, or rolling stones or sand might cause the loss of foothold, followed by a swift descent into the depths, and consequent utter annihilation of the explorers. One more effort was made to find a passage to the west for our train, and I sent our three men, who were gone two days and a night, and who reported that it was impossible to go further. We seemed to have reached the stopping place, and that wings were the only possible means of locomotion in any direction save on our back trail.

From certain points on the ridges fine views of Mt. Olympus were obtained, and the great mountain loomed heavenward bearing its mighty glaciers and fields of snow that glistened in the sun. Rumbblings were heard as if avalanches were descending; these succeeded by a crash after a few seconds' interval, and this was imagined to be some swift-moving glacier on Olympus that reached the edge of a chasm, broke off and fell into the gorge, possibly the cañon of the Hoh, in a similar manner as the Muir glacier is constantly throwing off bergs with explosions like the discharges of artillery.

Further progress being impossible, I decided to retrace our steps, descend the Elwah to a point where our first camp from Port Angeles was made, and cross by a trail that led to Lakes Southerland and Crescent, and then follow up the Solduck and cross to the headwaters of the Bogashiel River, which is stated to take its rise from one of the glaciers on Mt. Olympus. Great fires were now raging in the mountains, as no rain had fallen for six weeks, and dense smoke obscured all the view and effectually put an end to photographing. A perfectly beaten and easy trail runs along the Solduck, and horses travel it frequently, but from the Solduck to the Bogashiel is another matter. The trip to the latter river was successful, five elk having been obtained, but the animals were scarce and they were only procured after much toil and deprivation. The country, when the vicinity of the snow range is reached, is so rough and broken that it is next to impossible for a man to travel over it, and to take horses is out of the question, and ours were left for a month shut in a grassy place. Everything must be carried on one's back, and every year the elk that remain are retiring further into the recesses of the mountains. The rainy season had also set in, and out of thirty days it poured more or less in torrents for twenty-eight. On this elk trip no collection of small mammals was made. A fine series of fish was procured from the two lakes, embracing every species known to inhabit these waters, and some new ones. A list of these will be published by my chief assistant, Dr. S. E. Meek. The trout in Lake Crescent grow to an enormous size, and one specimen was taken that weighed 13lbs. Altogether between 500 and 600 and 600 specimens of mammals were obtained, with few exceptions embracing all the species known to inhabit the region, besides the fish above mentioned, and sundry reptiles and insects.

The Wild Pigeon in New England in 1663

In looking through one of the earliest publications relating to New England, I came across the passage quoted below. As much interest has been manifested of late in regard to the life history of the wild pigeon in the United States, and as the work referred to is probably not accessible to many of your readers, I thought it might be well to put this in print. The title is, "Two Voyages to New England, Made During the Years 1638-63, by John Josselyn, Gent. Published in 1674." I am not so fortunate as to possess an original copy; this is from the Boston reprint of 1865, and is from the "Second Voyage" (1663), which has a quite full account of the wild beasts, birds and fishes of the new settlement:

"The Pidgeons, of which there are millions of millions. I have seen a flight of Pidgeons in the Spring, and at Michaelmas when they return back to the Southward, for four or five miles, that to my thinking had neither beginning nor ending, length nor breadth, and so thick that I could see no Sun. They joyn Nest to Nest, and Tree to Tree by their Nests many miles together in Pine-Trees. I have bought at Boston a dozen of Pidgeons ready pulled and garbidge for three pence. But of late they are much diminished, the English taking them with Nets."

It will be noted that the wild pigeons began to be "much diminished" even at that early date.

THE FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Seaboard Air Line.—II.

THE spring travel of 1898 has been very heavy. As I wrote you last autumn, I exchanged "*auf weidersehen*" with many little friends "en route," and purposed to be on hand with a greeting for them on their return this spring. I was fortunately able to keep my engagement, and have to chronicle their arrival in due course. The orioles came on by special train, being four days ahead of schedule, arriving on May 6 instead of 10, as is their custom. I was surprised to hear the first males sound their cheery, "Hello! Hello, Will! Back again! Back again!" so much ahead of time, but they received a heartiest welcome nevertheless, you may be sure. My other little friends were on time, and appeared *en masse*, making the air at once vibrant with melody. Our unrivaled brown thrush as usual led the choir from the rustling treetops, while down below in the cool twilight of spruce and hemlock the swamp robins fluted inimitable grace notes to the robin's noisy obligato. Scarlet tanagers were in number, in marked contrast with the spring flights of past five years, as were the brown thrush, indigo bird and golden-crowned accentor. Of the great horde of less prominent individuals, the number seemed to be about normal. I saw no less than seven of the shy little accentors or oven-birds; one pair are with us still, having nested, though I have not located their "tepee" as yet. I do not name all the friends that have returned this spring; it suffices to say that most of the familiar forms and voices were noted in average numbers. A few geese and ducks slipped by in silence, high overhead, as is their fashion at this season.

As I have stated, I live at a way station on the line, but so attractive are its surroundings that most of the little travelers take a stop-over ticket when starting, and spend a few days with us before going on to keep their summer engagements further north. They have promised to look me up on their return next autumn. Should they not find me, I trust some one who loves them as dearly as the writer will be here to wish them a *bon voyage*."

In a Michigan Camp.

THE FOREST AND STREAM gospel of consideration for the wild creatures verily spreadeth apace. A young man with me found a brood of young partridges (ruffed grouse) the other day in the course of his day of work. He counted fifteen, and thinks there were a number more. Being sharp-eyed and used to the ways of woods dwellers, he put his hand over one of the downy golden youngsters. He could feel it under his hand, but could not see it. Carefully opening the rubbish and grass, he presently discovered the cunning young hider, and took it in his hand, where it very shortly became quite contented—indeed, seemed at home. When relating the circumstances to me, I inquired if he let it go again. "Oh yes, sir!" was the answer; "I was a good deal more careful to let it go than I was to catch it." He was obliged to put it down, as it was in no haste to go of itself. Carefully, he restored it to the place he took it from, nearly where the nest was hid, and where he could still hear the old ones calling.

Yesterday the same man found five young rabbits, each with a little white streak in its forehead. He did not think it wise to bring them in, so left them where he found them; but they had already become tame, and had no dread of him, and those with him—six or eight others. After talking with me about them, he went out to-day and brought in four of them—the fifth being gone. Was the fifth destroyed? Where is the mother? Well, they have a new mother now! They will sit in one's hand and eat clover blossoms, and suck a rag dipped in milk just as if they had always done it. We have a mite of a shepherd pup in camp. Guess we better bring them up together.

Game Bag and Gun.

"Exterminatory Peregrinations."

Editor Forest and Stream:

In your issue of June 10 I commented upon our new Florida game law, and spoke of the influences making for it, chief among them being the outrages perpetrated by game killers (of what I denominated "the Coquina type"), who have invaded our State and slaughtered our game and wild life. What I wrote was thus intended to be explanatory of how we feel toward game butchers. That Mr. Shields (Coquina) happened to present himself to me as typical of the class under consideration was due to what I may term the accident of his having left on record in the book "Hunting in the Great West" a shameless account of his exterminatory peregrinations here. I wrote of Mr. Shields precisely as any other person going by his record might have written of him; and what I wrote was strictly from an impersonal standpoint. I had no more personal animus against Mr. Shields than I would have against an automatic shotgun shooting sixty times a minute and to all the thirty-two points of the compass at once.

But now comes your correspondent, Mr. A. F. Rice, who, in your issue of June 17, professes to see in my communication the inspiration of an "ulterior motive." He thinks I must be one of those whom Mr. Shields "has correctly branded as game hogs."

Bless your heart, how deliciously characteristic that is. I quoted from Mr. Shields his own account of killing plumed birds from steamer decks, dropping water birds in the ponds as he passed by, shooting garfish "for pastime," putting out the eyes of alligators and torturing them in various and sundry ways, setting fire to live opossums—and I did this with the single purpose only to illustrate the influence which such disgusting practices have had upon our lawmakers—and I am therefore, Mr. Rice sapiently concludes, one of those whom Mr. Shields has "branded as a game hog." To holler "game hog" is with these people "the whole thing." It

does it all. I have often wondered in a mild way what formula Joshua used when he caused the sun to stand still. I know now.

But Mr. Rice, if he will permit me to say it, is mistaken. I have never been branded by Mr. Shields—not that I know of. I have pursued my way as a sportsman for so these many years, without ever having been attacked, as so many others have been, by Mr. Shields because my catch of fish or game did not tally with what he decreed was the proper thing. I have never received, as have others, from Mr. Shields impudent letters taking me to task because my sporting ways were not his ways. In none of these several ways in which other folks are "stacked up against," as Mr. Rice puts it, have I come in contact with him. Suppose I had been assailed with his blackguard epithet of "game hog," what would that show? You know that out in the Yellowstone Park there is a Mud Geyser, which year in and year out spouts mud. Go there any day of any year, or any night, and you'll find it—bub, glug, glub—spouting mud. If you come too close you'll have to dodge the blamed thing. But even if it spatters you, you don't get mad at it. Because you are a man, and it is a natural curiosity. If you went to fighting a mud geyser, they'd say you were gone in your upper story, and probably put you in the lock-up of Mammoth Hot Springs.

Mr. Geo. O. Shields is to me, as I have said already, simply a type of the visiting shooter who has scourged Florida with his devilish exterminating forays. He presents himself to me as an impersonal phenomenon. His devastating crusade here was, to me, a manifestation of a phase of depraved human nature, rather than the exploits of an individual. I know him only as he describes himself and his deeds in his book. I go by his record as he himself made it and has recorded it and is to-day proclaiming it wherever he can get a dollar in trade for it. Being thus free and absolutely independent of any honest imputation of wrong motive, I claim my right and exercise it to speak the word which it seems to me is right to speak. If the language in my letter printed in your issue of June 10 was in any particular intemperate, I am sincerely sorry for it; but I still am persuaded that I did not express a half of the abhorrence of Coquina's cruelties in Florida, and of the disgust at the coarseness of Mr. Shields' recital, which any man of average sensibility must feel who reads his book.

Mr. Rice insinuates that my quotations were not fair. I quoted literally. Mr. Rice thinks I should have given the context of such sentences as these:

"Capt. Schoonmaker informed us that we would find plenty of game from this point up, so we brought out our guns—Dr. W. got his shotgun and I my rifle. We took up our positions on the quarterdeck ready for business."

"Then there was sport! He gave us such a gymnastic exhibition as only a wounded gator can give. He first tried to stand on his head, then he tried to stand on his tail. Then apparently tried to turn himself wrong side out. Finally, recovering temporarily from the shock, he reached the water, and was lost to our sight forever."

"During the remainder of the day we had fine sport shooting blue herons, white egrets, blue and white ibises, ducks, cormorants, coot, etc., but owing to the motion of the boat (she made about fifteen miles an hour) I made rather a poor score with the rifle."

(Mr. Rice avers that these birds shot from a passing steamer and left to rot were killed for "museum" purposes. I confess I hadn't thought of that. Mr. Shields perhaps meant to make a "museum" of all outdoors.)

"I was thirsting for the blood of a 'gator.'"

"We saw large numbers of garfish sporting in the sunlight. We shot a few of them merely for pastime." (More "museum.")

"The smoke had scarcely cleared away after my last shot, when a third gator looked up near us, and instantly caught a right fielder in his left eye, that turned him over."

"I went back, and there, sure enough, was an old fellow swimming along down the creek as unconcernedly as though he had never heard the report of a gun in his life. I waited until he came within about 50 ft. of me, and then gave him one in the leeward optic. He turned two or three somersaults, and stopped on his back with one forefoot sticking out of the water. We left him there as a warning to his kind." (What "museum" is he in?)

"We put a bunch of dry moss in the opening and set fire to it. In a few minutes a possum came tumbling out through the fire, and old Rover, who stood there waiting for him, made short work of him." (Old Rover, too, appears to have been working the "museum" racket.)

"While we were at supper, a large gator raised his head in the middle of the river opposite our tent. I sent a message from 'old reliable,' and in an instant more he was lashing the water into a foam, minus an eye." (Any "museums" up your way, Mr. FOREST AND STREAM, stocked with one-eyed alligators?)

"For instance, there are cranes, pelicans, cormorants, water turkeys, alligators, etc., offering shots at all ranges, and affording such fine opportunities for practice that anyone is justifiable in improving these opportunities when not in localities where game is to be found." (Let your "museum" instinct have full play, as it were.)

Could a ton of context relieve these passages of their coarseness or prevent them from giving stamp and character to the book?

Mr. Rice says that in those days we all did such things. I envy Mr. Rice his manifest enjoyment of the blessing of youth with its credulousness and optimism; but I want to tell him that he has turned his back upon the pole star of truth when he entertains the queer notion that we were all like the Florida butcher in those days. Why, there were plenty of sportsmen then. We sportsmen were not all born yesterday. Sportsmanship did not come into the world when Coquina established the L. A. S. as a business enterprise to advertise himself. But really it is hardly worth while to consider the implication made by Mr. Rice that in the days when Coquina, shooting from

steamer's deck, was killing plumed birds to rot on the shore, the practice was one indulged in or approved by sportsmen. There have always been among shooters individuals who were prompted by thirst for alligator blood, and lust for killing everything within sight, but we did not in those days any more than we do now call them sportsmen.

Mr. Rice tells us that these Florida atrocities were perpetrated when Mr. Shields was a youth. I am sure I don't know just where Mr. Rice draws his mark between youth and adult manhood, but come, now, it does seem to me that when one has arrived at an age where he has assumed matrimonial obligations he ought to be expected to have fixed principles about the destruction of innocent creatures on the water or in the air.

Mr. Rice intimates that the author of the book has repudiated its teachings. If the record showed this to be the fact I would be the first to welcome it, but on the contrary the circumstances oppose any such conclusion. In 1889 (which was not so very long ago) Mr. Shields tells us that this book, "Hunting in the Great West," had met such a kind reception that he was encouraged to print his "Cruisings in the Cascades" (with "museum" material of the same sort). The edition of "Hunting in the Great West," from which I have quoted, was printed in 1890—not so long ago. The fact is, moreover, that the book is now, to-day, advertised and sold by Mr. Shields. So that now, at the present time, Mr. Shields is making public boast of how he killed our plume birds to rot on the river banks, and of how he mutilated our wild creatures for fun.

How this fits in with Mr. Rice's theory of a humble and contrite heart, for the life of me I cannot see. It appears to my feeble understanding that one evidence of contrition and regeneration would be the suppression of this roster of one-eyed alligators whose leeward optics had been bored out by Mr. Shields, this catalogue of the plume birds of North America killed from steamer decks by Coquina here in Florida. It is a book which, it seems to me, any right-thinking man would call in and suppress, instead of trying to find new readers for the braggart self-revelation contained in it. If I were a reformed game butcher with this "Hunting in the Great West" in my record, I'd let a contract for sackcloth and ashes, and I'd bury the book so deep that you'd have to sink a shaft deeper than our deepest St. Augustine artesian well to resurrect it. For let me assure you of one thing, such a book is an eye-opener as to the sportsmanship record of the man who wrote it.

And just here a word, to revert to Mr. Rice's ingenuous way of concluding the whole matter by the cheerful theory that I have been "stacked up against as a game hog." I will say confidentially to Mr. Rice that I don't take much stock in the noisy reiteration of that oburgation by his president. It sounds to me too much like the strident shouting of the convert who is not quite certain of his own conversion, nor any the more dead-sure that others are wholly convinced of it, but means to persuade them by lustily damning the sinners. In fact, to my mind, this besmearing of other folks with opprobrious epithets, discharged from the safe vantage of his official position, is all of a piece with shooting birds from a steamer's deck; that is to say in spirit the two are identical. It does not appear to me to indicate a changed heart, but only to be a changed manifestation of the same old heart.

And I don't see how, by holding in one hand a megaphone through which to shout "game hog," and selling from the other to "who'll have another one?" the "Hunting in the Great West" with its practical lessons in cruelty, the president of the L. A. S. can be expected to restore the plumed birds to our rivers, or to our one-eyed alligators the "leeward optics" he and his kind have shot out. I don't suppose he himself expects to. I do suppose that he will sell his book so long as he can get a dollar for it, and holler "game hog" so long as that brings in the dollars too.

Just one more word, and that of apology for the space I have unwittingly consumed. My pen has inadvertently been led on by Mr. Rice, and I have written more than I have intended, though on a theme by no means exhausted. But I am not concerned with Coquina, only with Florida. If in what I wrote the other day I showed what nature of man this is who is befouling others so lavishly with his blackguard epithets, let that be counted as incidental. My main purpose has been to put on record the attitude we have taken in Florida toward game butchers. We propose to have no more of them. I want to impress on any youth who may purchase of Coquina his book in this year of grace, 1899, and may be stimulated by it to deeds of blood which he thinks to perpetrate in Florida, the solemn truth that he would find himself here most woefully disappointed, and it would be better for him to stay away.

ST. AUGUSTINE, Florida, June 17.

Notes from Gettysburg.

GETTYSBURG, Pa., June 10.—Editor Forest and Stream: A covey of partridges were seen inside the town limits one day last week. Thirteen in number—two old birds and eleven chicks.

Thomas H. Bowen, of Mackall, Calvert county, Md., has caught carrier pigeon "N. A. 43912," and holds till owner can be communicated with.

N. S. Wautz, a farmer living near Pleasant Valley, Maryland, has in his possession a magnificent eagle which measures 6 ft. 6 in. from tip to tip of wings. It was captured by his son under singular circumstances. The youth noticed a flock of crows in the orchard which were making an attack on the eagle, which was sitting on a limb of an apple tree, and he concluded to take a hand in the battle. Picking up a stone he hurled it at the kingly bird, striking it on the head, which rendered it helpless. Young Wautz at once seized the eagle and carried it to the house, where it soon revived and is now caged.

Bass season is now in, but no reports from fishermen have arrived yet.

F. M. B.

THE FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

A Lion Hunt by Moonlight.

DURING the summer season of 189— I spent the months of December, January and February among the Golis Mountains in Somali-land, prospecting for paying deposits of pyritic ore, much of which is found in the narrow valleys between the high peaks of that picturesque range. In addition to half a dozen white miners, I had some fifty natives with me, two-thirds of whom were Somalis and the remainder a mixture of Matabeles, Kaffirs and "Cape Boys," the latter having served the DeBeers Company in the Transvaal and being quite expert in the ordinary routine of mining work, although so lazy it was next to impossible to get them to do much. We commenced operations about fifty miles north of the native town of Faf, and by Jan. 1 had progressed westward some 200 miles, finding ourselves in the heart of the Golis Range, and in about the wildest country to be found under the Southern Cross. The few native villages we encountered were formed of low, miserable huts, made by leaning a number of small trees toward a common center, their roots forming a circle on the ground, the spaces between being filled with leaves and mud. Even the more enlightened Somalis I had brought with me from the coast were inclined to turn up their noses at their less favored brethren, exhibiting a sense of lofty contempt that was very amusing.

The country had at least one redeeming feature—it was an ideal sportsman's paradise. While much of the soil was rocky and barren, producing no more pretentious vegetation than scattered cactus needles and thickets of wait-a-bit thorns, we would occasionally strike the bed of a mountain stream, fed by periodical springs, and would invariably find the banks lined with thick growths of mimosa and aloe trees, extending out on either side from 50 to 500yds., while the soft sand along the bed of the creek would be covered with tracks of antelope, hyena, wild boar, leopards and occasionally lions. Whenever we encamped near one of these "wadis," as the Somalis call them, we were sure to be treated during the night to a kind of infernal concert, in which the mournful howl of the hyena and the wailing cry of the jackal blended inharmoniously with the deep voice of the lion.

On Jan. 2 we arrived at a village by name of Zama, which, in the Somali language, signifies "the residence of the king." Although it was larger than any we had encountered since leaving Faf, comprising some 800 huts and perhaps five times that number of inhabitants, it possessed the usual amount of filth and mangy, yelping curs, the latter snapping at our heels as we made our way to the residence of the king; while the dirty Somalis lounging about the rude huts drove the blow-flies away from their eyes and watched us listlessly. Arriving at the door of the royal abode, we were informed that the king was asleep and could not be disturbed, but that we might see him later in the day. As it was really necessary to secure his permission—and thereby protection—to cross his domains, or spend half our time fighting marauding bands of Somalis, we encamped on the outskirts of the village and waited for his majesty to finish his siesta. The sun had nearly reached the line of trees in the west when a messenger brought word that the king would grant us an interview. After the usual amount of formality we were admitted into the royal presence and found the old fellow to be in a very amiable mood and willing to exchange anything in his possession for some of the gaudy trinkets we had brought.

During the interview, which I made as brief as possible, owing to the horrible stench of the place, the king informed me that we might be able to do him and his people a great favor, providing we were "mighty hunters," as he had no doubt all white men were. In explanation, he said that for several years his village had been much annoyed by a pair of immense lions, which had preyed nightly upon his herds of sheep and buffalo, occasionally going so far as to waylay a man or woman, for a change of diet. As we were intending to continue our journey at daybreak the following morning, I informed him that, much as I would like to oblige him, we could not possibly spare the time it would require. When I had returned to camp, however, one of my men, by name Allen, whom I had found to be a most venturesome hunter, proposed that we make a night hunt of it—a practice common among professional hunters in Central Africa, but one in which I had never indulged. In fact, it had always seemed hazardous enough to meet the king of beasts in the light of day, when one's life depended entirely upon nerve and eyesight; to seek him in the dark, or by the uncertain light of the moon, seemed to me to be a little short of tempting providence. As Allen appeared to be very anxious to engage in a night hunt, I at last consented to accompany him, and strapping on our cartridge belts we shouldered our heavy express rifles and accompanied by a Matabele by name of Mengwe (it is always best to limit such parties to two or three individuals), walked over to the village and informed the king that we were ready to proceed against his enemies, providing he would send several of his warriors along to show us the lair of the lions and would lend us a sheep for bait. This he readily agreed to do, and soon we were on our way to the haunts of the lions, accompanied by half a dozen Somalis, who were leading a half-grown mountain sheep. The lions were supposed to make their home in the heart of a forest of dense bush jungle, about five miles from the village, and some distance up a narrow cañon, or ravine, and as we made our way in this direction the Somalis regaled us with stories illustrating the great strength and prowess of the marauders. They had named the lion Bas-Acharin-rajel (murderer of many) and the lioness Eaj-Haib (evil one), and from all accounts they fully merited their rather fantastic titles. When they had first appeared in the neighborhood the natives had mustered up courage to attack them, and accordingly a great hunting party was formed, composed of nearly a thousand of the bravest warriors. This party had met the lions in the mountains near their lair, and after a decidedly one-sided battle, in which twenty-three of the natives were killed, the survivors had retreated pell-mell to their village, where they had since remained, preferring to lose their sheep rather than their lives. The story of the guides did not tend to increase our assurance to any extent, and it was with a feeling very close to fear that we made our way slowly and cautiously over the rough ground. When we had progressed about four miles our guides pointed ahead

to where the river bed we were following made a sharp curve around the base of a mountain, and informed us that on the opposite side of this mountain we would find the lair of the lions. They then bid us good night (at least that is the way I would interpret the Somal phrase, "Amar ku sikka"), and leaving us to our "fate," started on a run for the village, while we continued slowly on, keeping a sharp lookout for any sign of the lions, as the natives had informed us that the pair invariably used the ravine through which we were passing when making a descent into the valley in search of food. In fact, the well-beaten path which showed plainly in the fading twilight indicated as much, and so we moved with extreme caution, intending to select an elevation overlooking the path, where we could lie in wait for them. Soon we found a very desirable place, where a large boulder extended out from the side of the ravine, forming a kind of shelf, the upper surface being about 10ft. above the level of the river bed. It was an ideal place for an ambuscade, and tying the sheep to a large cacti plant we scaled the ravine and seated ourselves on the rock, where we carefully examined our guns to make sure they were in perfect order. Although our position gave us a decided advantage over the game, we were by no means free from danger, as the side of the ravine was not so steep as to prevent a lion, unless badly wounded, from climbing to the surface of the rock. In fact, the lions which infest the mountains of Somali-land and lower Abyssinia are able to scale the rocks like grizzly bears, as I had found once before, much to my discomfort.

While we waited in silence the twilight slowly faded into a shadowy dusk, which in turn gave place to complete darkness, so dense we could hardly distinguish the outlines of the river bed below us. Soon the first rays of the rising moon began to throw a dim, uncertain light over the mountain tops, which gradually increased in

THE VERMONT DEER M'KINLEY.

brilliance until it was so light we could have seen to read a newspaper, although at a distance of 100yds. it would have been impossible to distinguish between a lion and a sage brush. For nearly an hour we waited in silence, hearing nothing more interesting than the occasional howl of a hyena or the cry of a night bird.

"Wonder if they are going to disappoint us?" whispered Allen. "Perhaps they—"

"Listen," interrupted the Matabele. "You hear dat, sahib?"

"That" was a deep, moaning sound, which seemed to issue from the side of the ravine to our right, several hundred yards distant, and was followed by a number of most diabolical sighs, similar to the sound made by a choking horse; these were followed by a series of low, growling roars, which gradually increased in volume until the very mountain seemed to vibrate as they died away in a hundred little echoes. The "murderer of many" was leaving his home!

After the first series of roars, an apparently interminable time elapsed—a creepy silence in which we hardly breathed—while we intently studied the bushes to our right, vainly trying to detect some sign of life. Even the very crickets and night birds had ceased their chirpings, while the poor sheep, which had been bleating piteously at intervals, crouched silently on the ground. For several minutes we sat, straining our eyes and ears, on the alert for the first sight of the game, when a slight movement from the Matabele caused us to glance in his direction. He pointed silently up the ravine, and a second later I thought I could distinguish the sound of steps among the bushes, although I could not make out a living object. The sound grew more pronounced, and soon I could plainly hear the rustle of the leaves, as some animal brushes against them. Little by little the sound grew more audible, until I could plainly distinguish the footfalls of one or more heavy animals, and a little later was able to make out the forms of two large beasts, moving slowly along in the uncertain light. As they approached nearer I recognized the prowling gait of a lion. They were probably unaware of our presence, as the wind was blowing steadily from them to us, and moved along with slow, stealthy steps, while we crouched lower on the rock and noiselessly cocked our guns. As they approached nearer I could see that the lioness was in advance, the lion following a few paces behind.

They had arrived within perhaps 20yds. of our rock when the sheep, no longer able to restrain its terror, gave a frightened bleat. Instantly the lions stopped, the lion giving a subdued growl, which was answered by a snarling whine from the lioness, the latter crouching low in the bushes. For a moment the lion stood still, and then, with another low growl, began to creep toward the

struggling sheep, which was striving to break the cord that held it and bleating piteously. As he slowly approached I could see the phosphorescent glow of his eyes, which appeared to increase in brilliancy as he crept nearer. When he had arrived within ten paces he crouched as though about to spring; but after remaining in that position for several seconds he suddenly arose to his full height and began to circle the sheep, evidently suspecting a trap. The lioness had in the meantime crept cautiously forward until she was within a few paces of her lord and master, and was apparently about to disregard the caution of the latter and spring upon the sheep. As I did not want to sacrifice the helpless animal, I glanced at my companions and saw that they understood that the critical time had arrived. Leaning in their direction I whispered instructions for Allen to fire at the lioness, while the Matabele and I would take the lion, adding that they should fire at the flash of my gun. A second later the lion turned his side toward me, and aiming at a point just back of his shoulder (the uncertain light would not permit me to risk a head shot) I pressed the trigger. The reports of our rifles rang out almost simultaneously, and were followed by an angry roar from the lion, the lioness giving a frightened screech, and for a moment the smoke completely obscured our view. When it cleared we could see the lioness making off slowly, staggering as she ran, while the lion was making ineffectual attempts to scale the ravine in order to reach us, a dragging foreleg showing that a shoulder had been broken. Quickly recharging our guns we fired point blank at the lion's shaggy head, just as he had secured a foothold on a ledge of rock several feet below us, and was somewhat relieved to see him tumble to the ground, although he was on his feet in an instant. He had apparently had enough of this unequal warfare, however, and staggered after his mate, which had already disappeared in the brush. We gave him a parting volley, but as he was at least 30yds. away it probably missed him.

Following the wounded lions into the brush in the uncertain light was not to be thought of, and so we collected dry brushwood and built a fire, deciding to camp where we were during the night. On the following morning we took up the bloody spoor of the lion, and found him in the small "park" which these animals invariably clear around their lairs, lying on his side, stone dead. The lioness was nowhere to be seen, however, and as we could not spare the time to hunt her up (the small amount of blood on her spoor indicating that she was not badly wounded), we removed the skin of the lion with our hunting knives and returned to camp. On examining the carcass of the lion I found that one ball had pierced his left shoulder, splintering the bone; another had entered his mouth and lodged in his lungs, while two others had wounded him slightly about the head.

ART. S. JENNINGS.

In the Rockies.—IV.

Light thickens, and the crow
Makes wing to the rooky wood;
Good things of day begin to droop and drowse,
While night's black agents to their preys do rouse.
—Shakespeare.

SELECTING the choicest portions of the elk, we devoted the balance of the carcass to bear bait, dragging it along the mountain side for some distance with a couple of broncos in order to leave a malodorous trail for the benefit of *Ursus horribilis*. Each morning we visited it in hopes that a grizzly had found it during the night, in which event we would await his return in the evening. But the abundance of berries and other food seemed to have kept the bears from wandering far in search of supper, and although we knew from the sign that there were some in the vicinity our bait was unmolested, save by the wolves, who found it the third night.

Returning from one of these trips, we were gratified by a discovery Chad had made. The lake has several arms, formed by the embouching cañons, and in one of the remotest of these bodies of water Chad, while fishing and exploring that morning, had located the feeding grounds of a bull moose, and we determined to spend the night there in hopes of getting a shot as he came down to the lake. We took a nap after dinner, and late in the afternoon Dan, Chad and I tossed our blankets into the canoe and embarked in this nocturnal expedition.

Across the lake, in the solitude and silence of the twilight, our canoe slipped as noiselessly as the funeral barge in Tennyson's "Elaine," and then along the opposite shore beneath the mountainous mass of rock that rises a sheer 1,000ft. from the water's edge, cut with chasms and caves, and graced with fantastic figures by the action of the wind and wave. Weird profiles and masks looked down and frowned from the rocky walls, and a sense of loneliness and mystery fell upon us.

At last we rounded a rocky promontory, and came in view of our camping round. It was a level, meadowy expanse at the mouth of a cañon, from out of which a torrent rushed and poured into the lake its limpid water distilled from the snow fields above. The soft soil of the meadow was torn by many hoofs, its succulent herbage cropped close. Below it, in a little cove concealed from view, Chad made our camp, and while he was preparing supper I went up with rod in hand to look over the meadows and whip the stream that came down out of the cañon.

It was rapidly growing dark upon the shore of the lake, and night had already fallen within the cañon walls. With a white moth I whipped the stream a short distance up from the lake, and landed a couple of beauties, who put up a noble fight in that swift water. Leaving it, I started back on a straight cut through the meadow. As soon as I was beyond the deafening influence of the roaring torrent, I heard, or thought I heard, a sound. Pausing, I peered vainly through the shadows, and concentrated all my powers in the sense of hearing. I had just started on again, when suddenly something startled the stillness—a swishing sound; gazing in the direction whence it came, I descried on the mountain side above me a big bear complacently sitting on his haunches and stripping a bush of its berries at one fell swoop. So closely did his color assimilate with his surroundings that my eye had probably passed him over several times until, guided by the sound, he was located. With a lurching motion, much like a sailor on land, he strode to the next bush, and, as-

suming a sitting posture, stripped it of all its berries by sweeping his forepaw upward along its length, the branches passing through and between the long scimitar-like talons, which stripped them of leaves and berries alike. It was a grotesque, half-human posture, and the manner in which he brought the handful of bruised berries and leaves to his mouth, and gulped them down, was absolutely human in its gluttonous avidity. I had but a fleeting glimpse of this rare and unusual spectacle. His next move was to shamble a little further off, and his huge gray form grew quickly indistinct in the fast-falling darkness.

After eating we extinguished the fire and moved up nearer the meadow, where we secured a commanding position, and rolling up in our blankets lay in wait.

It was intensely still. The stars shone brilliantly in mid-heaven, but we were compassed about with darkness by the steep mountain ranges that arose around us. I started when I turned as I lay, and saw, high as a balloon, in the dark depths of the western sky, a gleaming point of molten silver. The moon, not yet risen for us, had found the snowy crest of some sky-piercing pinnacle. In the darkness we heard some animals moving on the mountain side, the rattle of the dry, dead shrubs and grass coming crisply through the keen air from far above us, and then the measured slosh, slosh of another moving with long, low strides along the swampy edge of the meadow. Oh, for a few moments of moonlight! Our gaze is riveted on the mountain tops, which are ablaze with silvery refugence. Slowly the light steals down, while the minutes drag their slow length along, until at last the full-orbed hunter's moon rests upon the rim of the eastern range, and floods the scene with its mellow and treacherous light.

Dan remained to watch the meadow, while Chad and myself cruised in the canoe along the lake shore. We spread our blankets on the bottom to deaden any sound, and I sat in the prow while Chad propelled the craft as silently as the shadow of a cloud. Hour after hour we stole softly along in the shadow of the shore. At last there came a sound, clear and unmistakable, a heavy animal moving through the brush. With frequent pauses it approached. Nearer and nearer came the sound, with intervals of silence when it paused to feed or listen. To our excited senses the sound was exaggerated, and with all my senses concentrated upon it in that intense silence, I felt that the animal was as big as an elephant. Neither of us for a moment doubted that it was aught but the giant of the *Cervidae*—the moose.

We were ambushed in a cove whose surface was dotted with water lilies, and whose shallow bottom was ramified with their long, fibrous roots, the greatest food in the world for moose. We waited with bated breath to see some big palmated bull wade out into the water and submerge his head beneath the surface in search of the delectable vegetable. I determined to take no chances. I made up my mind to wait until he should wrench a root from its bed in the mud, and stand in the bright light perfectly still, broadside on, chewing away in bovine content.

At last the animal is at the water's edge. Each leaf fringing the brush-bordered shore shone like silver in the moonlight. We heard the tinkle of the ice that had frozen along the margin, his hoof splashed into the water, and across the glossy surface a hundred gleaming circles sped in rippling, wavy chase. The next moment the bushes parted and gave egress to—a doe. Chad dropped his paddle with an exclamation of disgust. The deer threw up her head, and for one moment stood at gaze, the incarnation of startled terror, then, wheeling, she bounded back into the brush and crashed up the mountain side.

We returned empty-handed, and found Dan sound asleep where we had left him. We had our vigil in vain. But I recall it with no regret.

Never shall I forget the scene when the full autumnal moon rode high in the heavens. For a long time I lay awake and looked upon it. Above us towered the tremendous ranges of eternal snow, silvered by the moonlight, which splashed many a jagged precipice edge besides with the gleaming metal, but the precipices themselves and the lower steepes were all in indigo blue. The lake lay like a mirror. Faintly, from far above, was wafted the bugling of the bull elk.

Upon such a scene I closed my eyes past midnight, and when I awoke all was chill and gray, the pine-clad slopes were somber, and the upper steepes were dun-colored in the dawn.

FRANCIS J. HAGAN.
[TO BE CONTINUED.]

Pheasants in the Genesee Valley.

ROCHESTER, June 5.—There was a large and enthusiastic meeting of sportsmen in the office of F. J. Amsden, in the Powers Building, last night, for the annual election and reports of the Genesee Valley Fish, Bird Protective and Propagation Association.

The society is in excellent condition. T. W. Fraine, chairman of the breeding committee, reported that twenty pheasant had been liberated at Riga, Clifton and Fishers; sixteen dozen quail at Irondequoit, Chili Fishers and Seneca Park; he also reported that several dozen pheasant chicks were seen last summer by members of the Association.

Superintendent of Pheasantry Toogood reported that he had two cocks and nine hens breeding pheasants for the Association. Nine chicks have recently been hatched. The matter of having the members endeavor to interest the Legislature in extending the season for breeding pheasants was discussed, and an effort will be made to do this. According to the present law it will be lawful to shoot pheasant in 1900. It is believed that a longer period would result in stocking the forests so that there would be little danger of the bird becoming extinct. The treasurer reported that the liberation of birds had cost the Association about \$100. There is a balance in the treasury of \$117.43.

Officers were elected as follows: President, James H. Brown; Vice-President, E. C. Meyer; Treasurer, T. W. Fraine; Secretary, F. J. Amsden. H. S. Woodworth, Daniel Bascom, W. F. Brinsmaid, A. B. Lamberton, Thomas R. Griffith, E. H. Burrison, L. N. Ely and C. C. Laney were elected members of the Executive Committee.

Kansas Quail.

EMPORIA, Kan., May 30.—Am back here on my old hunting grounds, and on looking them over am very glad to say that the quail are in more than full numbers. The first stroll I took I flushed a bevy of about twenty within sixty rods of the house. They are now nesting, and this morning I saw a flock of young birds. There is one pair that I am sure have a nest within ten rods of the house. The breeding season is long here, and I think they must raise two broods, as I have seen their eggs as late as Sept. 20.

In the face of all claims to the contrary, I think Kansas is yet to be, so far as quail are concerned, the best shooting ground in the country. Instead of decreasing with the settlement of the country, they increase. The old settlers say that when they first come here, aside from in the timber along the creeks there were but few quail; but now nearly every line of hedge, or orchard, or bunch of brush that has sprung up in the pastures since the prairie fires were stopped, and each weedy, unburned slough, has its bevy of birds.

It is pleasant to be among them. Often, as I sit in the house at sundown, I can hear the notes of from two to half a dozen pair coming up from the grass lands about here; and in June I have ridden for mile after mile and not been out of sound of their whistle—the male bird sitting on the fence-posts or some prominent place, sending out his strong, clear "Bob White," or rather "More wet," as we used to interpret his note in New England, while up from some secluded place in the grass lands would come the softer, more plaintive note of the mother bird brooding over her treasures. Then often one or both of the old birds would be seen scuttling along the road or standing by the roadside looking at us as we

THE VERMONT DEER M'KINLEY.

passed. I could not understand this at first, but I soon learned that not far away was a brood of cunning little ones, and the old ones were simply trying to draw our attention away from their families to themselves. How I wish I could make them understand how safe they are, so far as I am concerned, and so persuade them to bring out their little downy treasures for inspection; but I cannot talk quail language, so I seldom get more than a glimpse of them until they are big enough to fly. As they grow larger they gather into the hedges, and it is always a pleasure to see them trotting along, feeding as they go; or at the call of the old birds bunching together.

It is this habit of bunching up that does more to thin their numbers than any other one thing, for there are but few hunters here who will not take advantage of it, and to secure from two to a dozen quail at a single shot seems to be something to be boasted of. One "man" boasted to me that in one of the snows of the past winter he potted thirty five at one shot as they were huddled together in the cold. I did not believe him. Neither did I call hard names, but simply said: "I should be ashamed to tell of it if I had done it." And I have reason to think this did more good than harder language, for it brought out much discussion, both at the time and later, and I know certain persons have something to think of in regard to game matters more than they ever had before.

One habit of the quail here that does much to keep up the supply is that of staying close around the farmhouses. On many of the farms there is a bunch of quail that feed in the corral and even with the tame poultry, and the farmer gets so attached to them that while he leaves the rest of his farm open to any one who cares to hunt, he yet watches and protects that particular bevy as closely as his flocks of hens. Then other bevies, on being flushed, make directly for the vicinity of the house. One bevy that I know of, when shooting begins find refuge in an evergreen tree in the dooryard, where they are never disturbed. If this is not just as much the exercise of reasoning power as for a Kansan to go to the cellar when he sees a cyclone coming, what is it? Here on the Cottonwood River there are several bunches that on rising invariably cross the river, and so never get cleaned out.

But, as I have said once before, the Kaffir cornfields are getting to be the stronghold of the Kansas quail, affording as they do both cover and feed. The corn is so dense that the young are safe from the hawks, which are very abundant here at just the time they need such protection, and as the crop is usually left in the shock through the winter, they can find food in all weather, and I am satisfied it is this that has carried them through the terrible storms of the past winter; and I would again recommend this grain to any who are interested in game preserves. It is not too late to plant it yet.

I would thank Mr. Cook for his pleasant words in regard to the quail holding their scent, but what I wanted to know is how they do it, and if the act is involuntary or voluntary; and if the latter, why they do not exercise that power oftener. Would also like to know how many eggs the quail lays before sitting. In several instances have found from sixteen to nineteen, and in one instance twenty-one.

Have read with much interest Capt. Gallup's comments on the eagle. From my own observation, I think that in anything but strength and power of flight, he is not much of an ornament on the shield of a republic. Would like to say to the old gentleman that though I have wandered far from the ancestral homestead, yet I am on the maternal side a Gallup of the Gallups.

PINE TREE.

[There is no definite number of eggs; the nets noted by Pine Tree may be taken as typical, perhaps.]

CHICAGO AND THE WEST.

The Kewanee Storage Case.

H. Clay Merritt, of Kewanee, Ill., whose illicit traffic in game has often been the cause of comment in the columns of the sporting press, is to go once more unwhipped of justice. His case coming up for trial under a judge more technical than wise, the jury had instructions which left them no option, and the greatest offender in this State, or at least the one best and most publicly known to be an offender against the game laws, is for the time free to try it all over again. This may literally be the case, for the State warden, Mr. H. W. Loveday, will move for a new trial and cite the earlier decisions of our Supreme Court as ground. Should new trial be denied the case will go to the Supreme Court direct. From the history of these several Kewanee cases, the people may gather a notion of the magnitude of the game dealers' interests in this State, and the hold they have in defending their great but lawless commerce. It is a long cry to the FOREST AND STREAM Plank of "no sale," but it looks as though that was likewise the measure of the safety of our Western game. Any sale is all sale.

Movements.

Mr. A. W. Adams, of this city, and one of our best known sportsmen, starts to-night for Greene, in Chenango county, N. Y., where he will spend a month or so with his brother, Mr. Platt Adams, of the latter place.

Mr. Harry Marlin is in Chicago this week on a business visit, and reports trade good, both East and West. It is his first trip on the road for some time.

Mr. J. Dyer, representing the Remington gun and the allied trade interests, is making a short stop in Chicago. Mr. Dyer is one of the oldest men on the road in the sporting trade, having sold shells and guns since the year 1, but he seems good for many years more of doing good.

Singing Mouse No. 15.

If I lose proper count in my record of singing mice, I hope to be corrected, but I believe that it is singing mouse No. 15 that I have now discovered. Here is his history, written by Mr. H. B. Smith, of Williamsburg, Va.:

"I have noticed your announcements from time to time in the FOREST AND STREAM in regard to the singing mouse, and as you seem to be making a methodical record of the existence of such a thing, please let me add one more instance to your list of authentic reports. Some years ago one of my sisters informed the family that she had frequently been awakened late at night by a strange, chirping noise, and that she had been forced to the conclusion that the sounds were made by a mouse. Investigation proved that nearly every night a mouse entered the room from a closet to get water, and after drinking indulged in peculiar vocal demonstrations. The whole household became very much interested in the matter, and the strange midnight singer was promptly adopted by the family as 'our singing mouse,' and especial pains were taken to protect it from the cat. One morning a dead mouse was found floating in the basin, and as the sounds in my sister's room were never heard afterward, it is reasonable to suppose that the drowned mouse was 'our singing mouse.' This drowned mouse was of the usual mouse color, and showed no abnormal structural development. As this letter is written simply to record a fact and not to evolve an anomalous species, I think it proper to say that no song birds have ever been kept in our family. The sounds produced were a succession of chirps, which, while they could not be mistaken by any one for the song of a canary bird, yet were so birdlike in tone and arrangement that the mysterious serenader was supposed to be a bird until my sister proved it to be a mouse."

Michigan Wardenship.

The new game warden of Michigan, Mr. Grant M. Morse, resides at Portland, in Ionia county, and he is reported to be a busy man already. Hon. Chase S. Osborne, ex-warden, and now Railroad Commissioner, is a rising man. It would not surprise me to see him Governor of the State some time. Mr. Morse may feel that he is on a ladder which runs upward if he likes.

The Prince a Poor Shot.

I don't know but I have, at different times, mentioned in these columns the visit of the Prince of Wales to the little town of Dwight, Ill., many years ago. Yesterday I was talking to Mr. Edward Kemeys, of this city, who lived at Dwight at the time of the Prince's visit. He says that the Prince had quite a retinue with him at the time, although he traveled incognito. Mr. Kemeys says that His Royal Highness was at that time a very poor shot. Of course, there were no breech-loaders in those days. A gamekeeper would load a gun and hand it to His Highness, and the latter would promptly blaze away without effect as the big birds whirled up. The Duke of Newcastle, an old gentleman, was a very good shot. He would wait until the bird missed by the Prince was well out, and would then kill it easily. "Your Highness," he would then remark, calmly, "that was a fine shot you made. You couldn't have come closer to the bird without hitting it." Mr. Kemeys tells me that he has shot over old Jock of Hazeldean, the pointer sent to Dwight by the

Prince of Wales. "He was a fine old dog," says Mr. Kemeys, "with a wonderful nose, and staunch as steel. I remember that he had three crooked hairs in his eyelashes, which turned in across the ball and sometimes inflamed the eye; and he had a tail set on rather high, which gave it an odd, arched look. He was a grand old dog, and I wish I might have another day with him on such prairies as those about Dwight used to be in those days long past."

180 CAXTON BUILDING, Chicago, Ill.

E. HOUGH.

A Veteran Camp-Hunt Club.

CLARKSVILLE, Tenn.—*Editor Forest and Stream:* I see so many highly interesting accounts of camp hunts of different clubs, and to read them is so much like taking a hunt with them, that I feel tempted to give a description of some of the grand outings our little club has had. I belong to a club that was organized forty-eight years ago—The Christian County Hunting Club. Some of its charter members are in it yet; they are quite old veterans of the chase. Our club is restricted to twenty members. I do not know if there are many older clubs. I believe it would be interesting to know the dates of some of the old clubs and their early hunting. Our club has kept a record of their yearly hunts. We have one member who boasts that out of forty-eight hunts he has been on deck at forty-six of them. This is Mr. J. S. Parrish, who has more deer to his credit than any member of the club. He is getting well along in years—I will not say how many, for this may meet his eye; but they sit lightly upon him. His eye is as keen and his aim as deadly as of old; he sits his horse like a centaur, and can outstride a Rough Rider. His laugh is as ready, his good humor as contagious and his love of sport as keen as with the youngest member. He attributes his good spirits and health to his wildwood life once a year.

In the early years of their hunts, the members could get to the best grounds in a day's drive from home; but the woodsman's axe and the pot-hunter have driven the game further and further, till they now have to go several hundred miles. One of their old deer drives is now a famous watering place, where thousands of visitors go every summer. We now take our hunts in Florida, Montana, Mississippi and Arkansas. Since we go by train and boat, one's baggage is not so restricted as when we went by the mule route, and it seems as if everyone takes advantage of it. To see our outfit unloaded at depot or wharf, one would think we had come to stay, and as a native remarked on seeing us unload, that "We had more luggage than the Southern Confederacy." Our Hunt does make quite a show when we get strung out—twenty men on horseback, seven wagons, six servants and thirty or forty hounds. It did look like we meant business, and we generally do. We don't try to kill game just for the sake of making a record, but it takes a good deal of meat to satisfy twenty hungry hunters and the guests that we always have, say nothing of the servants and dogs. We thoroughly enjoy each hunt. We don't believe in making a toil of a pleasure. I will some time give a short sketch of some of their early hunts in Kentucky and Tennessee.

C. L. BRADLEY.

Long Island Meadow Hens.

LONG BEACH, L. I., June 19.—Meadow hens were never quite so plentiful as they are now. Old baymen say it is due to the continued dry, clear weather and the absence of the usual cold storms, which so often occur during the season of incubation. The law permits the killing of the rail, mud hen, galinule, grebe and bittern, the birds likely to be found with the common meadow hen, at any time except during the months of May, June, July and August. During the month of September there is therefore likely to be some fine sport in this vicinity, killing the meadow hens and their relatives, appropriately known as the clowns of the meadows and beaches.

Philbrook.

SOUTH HANOVER, Mass., June 13.—*Editor Forest and Stream:* In your issue of June 10 the always-interesting Mr. Hough speaks very approvingly of the hunting knife which I made for him. This is pleasant, but your compositor puts wormwood in my cup by making me Philpot instead of Philbrook.

Now I take some pride in my name. My ancestors were people of good repute, and my father was a "mighty hunter before the Lord," being both a sportsman and a clergyman. So kindly give space in your valued paper to the correction, and get me right before your readers.

N. W. PHILBROOK.

In his "Break-up of China," Lord Beresford says that the troops are armed with fourteen different styles of rifle, including the "gingal." The latter is a weapon between 9 and 10 ft. long. * * * Their weights vary from 40 to 60 lbs. Three men are required to handle them. When in action, the gingal is laid along the shoulders of two men, while the third man fires it. I also saw bows and arrows. * * * It seems incredible, but some of the soldiers are still practiced in shooting with bows and arrows at a target. When at Pekin, I saw them practicing in an open space near the observatory. Hitting the target is a detail of minor importance; the real merit consists in the position or attitude of the bowman when discharging his shaft.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Notes from the Pacific.

SAN FRANCISCO, June 13.—*Editor Forest and Stream:* In my last I mentioned that the fiat had gone forth against the seals, on the plea that they were getting more than their share of the fish in our waters, all of which was put on the ground of public utility, but really in the interest of the Italian fisherman, for nobody else cared.

The result was a determination to exterminate the fish eaters. The seals congregate in great numbers along the rocky shores of the coast outside the harbor, having what are called rookeries or breeding places. At our famous seaside resort, the Cliff House, a collection of outlying rocks lying a few hundred yards from the shore have always been a favorite resort for the seals, hundreds of them coming to the rocks for their midday siesta, and so affording a very interesting sight to tourists and visitors. They are a great attraction, so much of a feature that the proprietors of the hotel some years ago procured the passage of a law prohibiting their destruction. Of this immunity the seals seem to be aware, and consequently exhibit themselves to visitors with apparent pride. Some of them are very large, weighing from 1,500 to 2,000 lbs. The bulls, or sea lions, as they are called, are very belligerent and fight savagely. Some islands lying out at sea some fifteen or twenty miles, and belonging to the Government, are also favorite resorts.

Representation having been made to the Government of the destructive appetites of the seals, permission was obtained to invade this favorite haunt of the fish eaters. A number of sharpshooters were engaged to commence the work of destruction, and repaired to the haunts of the seals on the coast just above the entrance to the harbor, and for a few days hundreds were killed. But the intelligent animals soon discovered that they were being made game of, and quietly took their departure for the rocks, it is said, which are protected by law from the rifles of the destroyers. At any rate, the shooting gave out, not a seal showing himself, and now comes the withdrawal of the permission by the Government to shoot on the Farrallone Islands, probably the result of a protest by friends of the seals against their wanton destruction. So the whole scheme seems to have ended so far in a fizzle; and the seals appear to have won, and will continue to indulge their appetites on fish diet, regardless of the interests of the foreign fishermen and the canneries that load ships for foreign ports with canned salmon by the thousands of tons.

The Acting Chief of the Biological Survey, in countermanding the permission, writes the Fish Commissioners asking if they are certain that seals eat salmon exclusively, and whether they do not feed on other fish indiscriminately. This is a puzzler to the Commissioners, so far as the consuming of other fish is concerned. No doubt the seals do eat something else when a salmon is not handy; but the general opinion is that they prefer the best the market affords, and are epicures as to salmon, the proof being that in crossing the ferry we frequently see them tossing and playing with big salmon in their mouths. It looks as if the Commissioners had the best of the argument. Meantime the shooting goes on along the rocks not under Government jurisdiction, although it does not amount to much.

I see by the last number of FOREST AND STREAM that the trout fishing has been unusually good this year. The same is the case with us. Large catches are being made by the anglers who are so fortunate as to be able to kick the shackles loose from the slavery of business. Even in the immediate vicinity the sport has been good, but in the more remote streams many fish are being caught, and of large size. Reports from the McCloud, the home of the Dolly Varden, is that they are running larger than ever before; and in our famous Lake Tahoe, even ladies are counting their success by the hundreds of pounds. Fish there are taken by trolling, the lake being too deep for fly-fishing. But in the outlet, the Truckee River, trout are taking the fly greedily, averaging 1½ lbs. But there are many streams further north and just over the boundary line in Oregon where they run from 4 to 6 lbs. There is one place, an Indian reservation, where three or four friends, who are so fortunate as to obtain special permission to fish the waters of a river running through it, make their regular summer excursion from here and camp out, taking their supplies and tents from here, and spending five or six weeks, enjoying fishing as is fishing. They fish from canoes, handled by Indians. The stream is rapid with pools that require skill in management of the canoe. Six-pounders are not exceptional.

But for my part I prefer for fly-fishing more moderate size. It is work to handle fish of such weight, and there is more sport in filling your basket ("creel," I suppose I should say) with those of from ½ to 1½ lbs. With light tackle, you have the sport without the labor. I am aware that I shall horrify all the scientific anglers in declaring that I am not partial to the lightest tackle either. No 6oz. rods for me. I want to handle the fish and not have the fish handle me. Not that I propose throwing them over my head and landing them in the top of a tree. There is a happy medium, and an 8 or 9oz. rod gives the power to handle your fish within a reasonable time. It is all very well to spend a half-hour or an hour over one fish, when they are scarce and far apart; but I prefer to keep moving, and am curious to see what the next fellow will be like.

For salt-water fishing, we claim that not on the Atlantic or Pacific coasts is there a place that equals Catalina Island, in the Santa Barbara Channel, about thirty hours by rail and steamboat down the coast, where almost every variety of fish can be caught, weighing from one to hundreds of pounds. It is also a delightful place of resort, with a heavenly climate, neither hot nor cold; delightful bathing and romantic drives; a good hotel and moderate charges; boats galore, and at a day's cost not equivalent to the cost of the boat itself. Everything moderate. It is the headquarters of the famous Tuna Club, the chair-

man of which is high hook—the man that has caught the largest tuna with rod and reel—until he is dispossessed by the man who has caught a still larger one. These little pan fish are a species of herring weighing from 100 to 300 lbs., very much like the Florida tarpon, and equally gamy. The big sea bass are abundant and equally large. I saw one at a tackle store yesterday from Catalina, that weighed 400 and odd pounds, caught with rod and reel. Hod carrying is nothing compared to that kind of labor; and I don't hanker after such.

Those who prefer salmon fishing can get all they want off Santa Cruz, three or four hours down the coast, by trolling from boats, or in the fall with rod and reel on any of the rivers in tide water, where they empty into the Pacific; and if you want heavy sport, there you are. A 15 lb. salmon, doing an acrobatic business, jumping 6 ft. in the air and sprinting at the rate of thirty miles an hour and over, is no joke, and when finally captured you sit down on the thwart of the boat and blow with the impression that you have just dug ten bushels of potatoes. Sport enough for the likes of me, and no higher ambition for 300 lb. tunas or 400 lb. black bass.

Englishmen go to Norway—a long trip at great expense—and think they have done wonders if they land three or four salmon in the course of two weeks. A trip to California with more wonders to see would repay them better, and I will guarantee them as many salmon in an hour if they can handle them in that time.

I saw a curiosity a few days since—an old, long, single-barrel flint lock shotgun, and with it a bag of flints. It belonged to an old Missourian, who brought it across the plains in 1849. I tried to buy it, but the old man said no. It belonged to his grandfather, and had killed more Indians, deer, "b'ars" and coons than would load a steamboat. It was a rum looking old craft indeed, with a barrel 36 in., the stock running the entire length—split and wired up with tin plates—a marvel of patch work. It was about 8 cal. It had the appearance of an old-fashioned Kentucky rifle that had been bored out. The old man said she was a terror to shoot—rather a question of which he meant, the shooter or the shootee. With the usual old style of load of about four fingers of powder, well rammed down, and a handful of buckshot, she must have awakened the wilderness and knocked the shooter endwise, unless he took the precaution to have a tree at his back. It reminds me of my boyhood days, when we drew straws to see who should fire the old Queen Anne musket Fourth of July, and be laid up with a lame shoulder for a week—a good excuse for not having to milk or split the kindling wood.

PODGERS.

P. S.—If your correspondent that wanted flints did not get a supply, I think I can beg a few for him from the old Missourian. They are of a very old-fashioned brand, and like wine, must have improved with age.

The Dolly Vardens of the Dosewallups.

SEATTLE, Wash., June 3.—The Dosewallups is a name that grows on one. When the unusual sound first greeted my ears I could not help thinking of Skamokawa, Mukilteo Humptulips and Puyallup. That was years ago. Now the familiar sound recalls long miles of beautiful fishing water, swift riffles where the Dolly Varden and the rainbow wait on the tyee salmon, and deep shady pools where the monarchs of their race, whaling big trout of 10 and 12 and 15 lbs., hold the fort against all comers.

To fasten a hook into the jaws of one of these big fellows has long been a cherished ambition of mine, and repeated failures only served to inflame my ardor. How at last I succeeded in reaching that consummation so devoutly wished for and met with defeat on the very eve of victory is the object of this yarn.

The Dosewallups is a rapid mountain stream flowing from the heart of the Olympics into Hood's Canal, an arm of Puget Sound, and distant from Seattle fifty-eight miles by water. Apart from the attraction it holds for the angler, the lover of nature would find a visit interesting. On either side towering mountains shelter the narrow valley along its course; deep cañons walled by solid rock confine its waters, that rush through in angry foaming torrents, to glide peacefully over wide reaches shaded by thickets of alder and maple.

Nestling close under the foothills on the wide flat made by the river at its entrance to salt water lies the little settlement of Brinnon, where the fisherman may find accommodation if he be a stranger in the land. A good wagon road follows the course of the river for eight miles, and beyond a trail goes six miles further into the mountains. Here and there along the valley settlers have hewn themselves homes out of the wilderness, in all some ten or twelve families being located along the river.

It is just six years ago this very month that I paid my first visit, and although I fished patiently "from morn till dewy eve" up stream and down, offering the juiciest morsels of bait and the most alluring of spoons, no trout came to creel. But they were there. I remember clearly how, late in the afternoon, tired and disconsolate, I sat on a shelving rock above the river. Directly beneath me was a deep swirling pool which I felt sure was the abiding place of more than one big trout. Presently my attention was attracted to the shallow water above, and there I saw with amazement actually dozens of trout, and of such unusual size that I could hardly trust my own eyesight. They were swimming slowly from the deep water, up on to the riffle in quest of their evening meal. Alas for wasted opportunities! Had I but known it was the "succulent minney" that they were after! (And right here the confession must be made that at that time I belonged, and still owe, allegiance to the ancient and honorable brotherhood of "plunkers," sneered at openly by many who practice its rites in secret.)

Every year since I have visited the river, sometimes for a day and again spending a hurried vacation of two or three days on it, occasionally rewarded by a small catch, and on one memorable trip killing two rainbow of 5½ and 4 lbs. respectively.

At that time I made the acquaintance of Mr. Frank O. Robinson, a resident of Brinnon, a thorough sportsman and the most successful fisherman on the river. In

fact, I believe Frank is responsible for the death of more trout, big and little, than all the fishermen that ever visited the locality. The rig he uses is entirely different from anything I have ever seen, and a brief description of it may be of interest. Frank tells me he got the idea from a rig used by the Siwash in trolling for salmon, using herring for bait, but he has improved on the original. Presume that you are using 150ft. of black silk braided line. Cut two lengths from it, one say 30in. long and the other about 9in. Take the 30in. length and loop it at both ends. To one end secure a swivel and to the other a plain ringed hook of good size. Now take the 9in. length, loop at both ends and to one end fasten a hook a size or two smaller than the one already used. Make a running noose on the vacant loop and pass it over your 30in. length, securing it so that it can be passed up and down at pleasure. Adjust the upper hook so that it will hang about the length of a minnow above your lower one. Below your swivel two or three split buckshot are necessary in a strong current to act as a sinker, and when you have secured your swivel to your line you are almost ready for business.

Take a live minnow 3 or 4in. long, pass the lower hook into its mouth and through the body, bringing it out under the belly as far down as possible. Secure the upper hook point upward through the minnow's head, adjust the slip noose on your line till you have the minnow stretched out full length, both lines being perfectly taut. Cast well out into the current, allow your bait to be carried down stream some distance from you, then draw in gradually, working your minnow. The life-like action of that minnow in the water will surprise you and its death-dealing qualities cease to be wondered at.

Frank and I had planned several times to go out on the river together, but some business always intervened. He came to town the other day with a photograph, which I inclose, of four trout, three of which he had caught during one afternoon—the small one on the left a rainbow of 5lbs., standing to the credit of Mrs. Robinson. The other three weighed 10¾, 10 and 5½lbs., all Dolly Vardens. The sight of these and a warm invitation from Frank to join him for a day or two, was all that was necessary to set my appetite on edge.

Next morning found us on the steamer, and by 2 o'clock we were in Brinnon. We started to fish at the mouth of the river almost on salt water, where Frank had caught the big ones a few days before, and fished carefully up stream. Evening found us at Rocky Point, a mile up, without a single trout. Here at a sharp bend where the river runs against a high rocky bluff is a famous hole, and in it we surely would find them. But even Frank's skill failed to meet any response in the shape of a strike, and starting for home we discussed the situation, both equally at a loss to account for it. The river was in splendid fishing condition, owing to the cold weather.

Making an early start next morning, we fished over exactly the same ground with the same result, and meeting at Rocky Point about 9 o'clock we decided they were higher up, and determined to follow them till dark. Very shortly after I was rewarded by a strike, and landed the first trout, an innocent who weighed only 3lbs. or so.

This was altogether too small to make any fuss over, so I yanked him out without ceremony.

About 1 o'clock we reached Roselle's Hole, the furthest up point I had previously been, and as this pool can be fished only from one stand, Frank sat down and invited me to go ahead.

Casting well above, I allowed the current to carry my bait down to the end of it, then starting to draw it in, I get a telegraphic communication that makes me stand up straight. Jabbing it back—whizz—away goes the line, a big one by the heavy pull, and I am fast to him. He stays by the hole and cavorts around it like a Siwash on a jamboree, but the automatic keeps a steady strain on him, and slowly he is brought to shallow water. Here he makes some rushes that take my breath away, but after a long struggle I slide him out on the bank. Six pounds at least is Frank's verdict. A close guess, for the scales at night show 6¼lbs. A second one of 5lbs. is hooked by Frank a few minutes later, and safely landed.

We feel we are doing better, and contented we rest here; eat our lunch and smoke the pipe of peace.

We are sure now the big fellows are higher up, and determine to follow them. Soon we come to the first cañon. Here for a mile the water rushes through narrow rock-bound walls, and we are obliged to clamber up hill to the road and follow it, the river entirely hidden, but the roar it makes constantly in our ears. Again striking the valley, we find a wide reach, where, with hip boots, we can just manage to wade over. The objective point is a long, deep, shady riffle, where we are likely to meet our game. Frank soon reports a heavy strike, which he misses, and as I am close by he allows me to try for him. Letting out more line, the minnow drifts down; then as it is drawn up I see a long brown body shoot along the top of the water, and even before I feel the strike I sock it to him with the butt, and "there she blows." The circus is going again in full blast. But here is an ideal place to play a fish. Clear, shallow water, no hidden roots or logs to give him vantage. I let him have his own way in all things, till finally, completely played out, he is brought to shore, a sight for the sons of men to rejoice and be glad over. Seven and three-quarters this one, and the largest for the day.

Keeping on till evening, fishing only the likeliest pools, 7 o'clock found us six miles from home with fifteen trout. Of these Frank had killed nine, after invariably allowing me to fish the best places ahead of him. Dividing the catch and strapping them over our shoulders, we started for home, tired, hungry and happy.

We had planned a trip to the Duckabush for the next day. This river is only three miles from the Dosé-wallups, just over the divide, is somewhat smaller, and the fishing in it is just as good if not better. But we had already all the fish we cared for, save my big fellow, and decided we should go still higher up our own river and spend the day in search of him alone.

Before retiring we cleaned our catch, and the contents of their stomachs was quite interesting. In one we found a frog little the worse for his experience, save that one leg was chewed up considerably, smaller fish of various kinds and sizes, a very little salmon spawn and any quantity of periwinkles, a small shell bug found all over

the river bottom. Laid out side by side, they made a most imposing show, and cleaned, the catch weighed exactly 52lbs. Next morning before we started Frank took a shot at them with his camera.

And now comes the story of the big fellows that got away. They always do. Taking Frank's mules, we rode up eight miles, then tied them up, took to the trail for two miles more, and struck in to the river. We fished down stream for almost an hour without result. Then we came to a deep pool overhung by maples, and in all respects an ideal spot for the object of our search. My companion declared at once that here, if anywhere, the whale would be found. Casting in, slowly the current carried my line to the end of the swirl, then as I lifted the tip to work it back, it came. A strike so fierce and sudden that it sent a thrill through me, and only Frank's loud halloo brought me to my senses. "There! Now you've got him at last. That's a big one sure. Hang on to him. Hang on to him." "I'll hang on if I have to follow him to salt water."

But this big fellow wasn't built that way. He sulked and I couldn't budge him. Then he'd take a saunter round the pool, and I'd try to lift a little to get a glimpse of him, but I might as well have tried to lift a tree. Now thump, thump, thump would come along my line, and it felt as if he were smashing his head on the rocks away down at the bottom of the pool. I kept all the strain on him that I dared, and still every once in a while I could feel that thump, thump, thump, just like the screw of a big steamer. Then suddenly I felt my line slackened, and my reel being open it came toward me in a helpless can't-help-it kind of style that made me sick. He had worked himself loose. I laid my rod down and felt like—Well, no language that I had any knowledge of could do the situation justice. Frank at sight of my face was in convulsions of laughter, but it was some considerable time before I could join him.

It took a large portion of cold chicken, many slices of home-made bread and butter and copious draughts of river water to restore my balance. My companion meanwhile had amused himself landing one or two little fellows of 5 or 6lbs., but I could not pretend to take any interest in the proceedings. Starting out again, we kept on down stream, Frank occasionally landing a trout.

We reached a small cañon where the water entering diagonally made a tremendous swirl at one side. It was very deep and looked promising. Clambering down, I cast in, and in a minute or two was fast to a fair-sized fish. He put up quite a fight, but presently gave signs of quitting, and when I got him to the top of the water—there—right behind, following his every movement, was the largest trout I had ever seen dead or alive. I lost all interest in the one I was playing. "Holy Jonah," I yelled to Frank. "Come and see the whale." He cautioned me as he came down to keep quiet. I slid my fish in to him, which he unhooked, telling me I would get the big fellow with the next cast. Putting on a fresh minnow, I dropped my line in, but for a few minutes there was no response. I think the water at this particular point must have been soft, deep, and the river not over 15ft. wide, making the swirl so short I had to fish almost straight down. Suddenly in moving my line I felt it stop gently. I wasn't sure it seemed like the nibble of a small fish. Then a little pull, and hesitating no more, I socked it to him good and hard. Quick as thought he came back at me with a jerk so strong and sudden that my rod snapped in two like a pipe stem, just above the butt, and I was left standing with about a foot of the rod in my hand, to which my reel was attached, and the rest of my rod was down in the river. Recovering it quickly, I found he had added insult to injury and taken my tackle along with him. Evidently it wasn't my day. Frank had offered me the use of a cane pole on starting out, and advised me to take it. But I had brought my salmon rod with me, and felt sure of being able to handle anything in the river. I had used it for years trolling for salmon in the bay, and killed fish up to 26lbs. But the pitcher that goes too often to the well will get broken. My rod was probably weakened by the unusual strain of the day before.

After this we decided to quit. On the way back I felt sore and sorry over my ill luck. But a sight of the string already caught restored my spirits.

An invitation from Frank to stop another day and try the Duckabush had to be declined. Bidding a hearty good-by to my kind host and hostess, I was hardly aboard the steamer when I was busy laying plans for a return trip and an active resumption of hostilities against that whale.

JOHN FRASER.

ANGLING NOTES.

Eyed Fish Hooks and Mental Telegraphy.

It is more than likely that I shall become a believer in "mental telegraphy," as I think Mark Twain called it in an article in the Century some years ago, when he related a series of coincidences in his own experience.

About two weeks ago I was looking for a place on Sixth avenue, New York, between Forty-second and Forty-third streets. I knew the name, but not the number of the establishment, being told only that it was between the two streets I have mentioned. I walked to Forty-third street, without finding it, and stood on the corner wondering if I remembered correctly the directions I had received. Diagonally across the street on the next corner was a building, and mechanically my eyes read the sign over the door, "William Simpson." The name was familiar to me in some way, and yet I could not connect it with anything, until in a flash it came to me that it was the name of a man I had written to within a few weeks in reply to a query concerning a work of the Fisheries, Game and Forest Commission, and that I had sent the letter to Sixth Avenue.

Walking across the street I entered the store and introduced myself to Mr. Simpson, and found that at the moment I entered my letter was on his desk, and he was replying to it. He was a contributor to FOREST AND STREAM, and in talking of fish and fishing, mentioned my "first letter." I assured him that I had never written to him but once, and that very recently. He said that eighteen years ago, because of something I had written in FOREST AND STREAM, he had asked me about fishing in the

Adirondacks, and where to go, and that I had replied, and he had followed my directions to the Seven Chain of Lakes, and had spent six seasons there. But about eyed hooks. A short time before I found Mr. Simpson in the act of writing to me, I was walking down Park place on my way to see about having some aquaria repaired for a fish exhibit, and noticed Mill's sign, and went in for a few moments, as I had not been in the place since he moved from Warren street. In talking about tackle, eyed hooks came up for discussion, and I expressed my opinion of them to Tom Mills, and for several days after, on occasions, eyed hooks came into my mind. A book came home from the binder's, where I had sent it to have new binding, and as I looked through it I was impressed with the fact that the colored plates of flies, etc., showed them to be tied on eyed hooks. The inscription on the title page shows that the book was given to me in 1883 by the late Dr. Elisha Sterling, the friend, companion and classmate of Dr. Garlick, the father of American fishculture, and it was written by Hewitt Wheatley, Sr., angler and publisher, in London, in 1849. The title is "The Rod and Line; or Practical Hints and Dainty Devices for the Sure Taking of Trout, Grayling," etc., and it is illustrated with steel plates, colored by hand, of flies, beetles, grubs, moths, spinners, etc. The book is filled with marginal notes and comments in the handwriting of Dr. Sterling, and extracts and paragraphs and whole pages are underlined by the same hand. I have looked at the book dozens of times since I have had it, and never before noticed that the flies were on eyed hooks. A comparatively recent invention, it was supposed, and not to be confounded with the common ringed hook. Upon looking at the text to find if the author really meant the hooks to be eyed, I found on page 74 the following, undersigned by Dr. Sterling:

"I generally use these (artificial beetle) on hooks having a fine eye at the extremity of the flank. In fact, I very commonly make all flies, large and small, on similar hooks; a practice which will doubtless be scouted by many anglers. Nor shall I attempt to persuade any one to adopt it, although it possesses the advantage of enabling me to use either fine or thick gut with the same fly. It is far more desirable, for when the fly is tied on gut, the gut is very soon so worn as to be unsafe, and the fly consequently valueless. Besides, in an ordinary sized round snuff-box, I carry to the river three hundred flies, a compression of the material with which I am well pleased, more especially as each is kept separate and available without trouble."

This I thought to be as much of a find as when I discovered Japanese flies to be tied on needle-pointed barbless fishhooks, a fishhook patented in this country within the past twenty years, and in use in Japan for two or three hundred years, and so I made a memorandum on my "Angling Notes" sticker: "See Wheatley's book for flies on eyed hooks and quote from page 74." I resolved that if ever I got the time to resume my angling notes in FOREST AND STREAM that I would attempt to show that the eyed hook, whether "turned down" by Pennell or "turned up" by Hall, was not a recent invention, as I supposed, for Wheatley's book makes it certainly fifty years old. Here is where the mental telegraphy or coincidence comes in. This morning the mail brought the Fishing Gazette from London, and as I opened the paper on the first page was an article by my friend, Marston, devoting two columns to Wheatley's book, and I was so amazed that I went to the angling notes sticker and looked at the memorandum and found it as I have quoted, so it was no day dream. I would like to know from Marston just when he wrote the article, for I think I can find from the bookbinder when he sent me the book after binding it, although it is possible I may not have seen it when first it was returned. If I made the memorandum at about the time that Marston was writing the article, I would be willing to take a few shares, common stock in Mental Telegraphy, Limited. Mr. Marston discovered from Wheatley's book much more than I did, for he finds that the "red tag" and "Alexandra" flies were either invented by Wheatley or in use before his time. Another discovery I will give in Mr. Marston's own words:

"Wheatley ought to have lived and fished nearly half a century later than he did, for he would have delighted in the 'dainty devices,' to use his own words, of the dry-fly fisher. That he was in advance of his time seems clear from the fact that he had eyed hooks made to dress his flies on; and most beautiful eyed hooks too—small, slightly turned-up eyes on the most perfect of Limericks, also special long-shank eyed hooks for May flies, beetles, etc. Thanks to the kindness of one of my correspondents, Mr. H. Longfield, of Broad View, Mallow, Ireland, I have in my possession a fly and a caterpillar dressed by Wheatley on his eyed hooks, and given by him to Mr. Longfield in 1856. I referred to this in the Fishing Gazette in September, 1884, after there had been much correspondence on the question of eyed hooks, which, for dry-fly fishing purposes, were reinvented by Mr. H. S. Hall and Mr. George Bankart.

"The caterpillar has a piece of gut still attached to the eye, and the knot used is the same as that which I, nearly thirty years later, christened the 'Turle Knot,' after Major Turle, who first showed it to me when I was fishing with him on the Test."

This is not the first time, by the way, that I have been in communication with the Gazette by mental telegraphy.

Several years ago I was experimenting with caging live May flies to see if they would bear transportation for the purpose of transplanting, and before I could print the result of my experiment, the Gazette published something upon the same subject from the pen of an English angler, who had been experimenting in the same field.

A. N. CHENEY

California Jewfishing.

AVALON, Santa Catalina Island, Cal., June 11.—The first Jewfish for the season of '99 was caught by Col. R. A. Eddy, of San Francisco, and weighed 240lbs.

Dr. Jno. Gallway, of Frisco, has just come in with a catch of fourteen yellowtail, one barracuda, one halibut, the result of four hours' fishing off Avalon. W.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

A Fisherman's Story.

THE president of the Fishing Club, to which I have the pleasure and privilege of belonging, is a most successful and enthusiastic fisherman, and I regard him as one of the greatest fishermen of the present time. His success in catching fish is only equaled by his powers of description, and he has given me many interesting accounts of his various experiences.

The following account I obtained either from our president or from some other source, which I do not recall just at present, but of course there are so many interesting fish stories that it would be unreasonable to expect any one to remember just where they all came from. The person, however, who had the experience which I refer to was fishing from his canoe one bright afternoon in the early autumn, but, not meeting with any great success, he had settled into a condition of calm and quiet repose. His fly was floating idly on the placid waters, and he was basking in dreamy delight in the sunshine which fell in a golden flood about him, and which is so grateful at that season of the year, and was just dimly conscious of the beauty of water and sky and hill by which he was surrounded. Suddenly there was a break and a splash of a huge fish, his fly disappeared beneath the waters, and he had a strike of unusual vigor, which awakened all his drowsy senses in an instant. He sprang to his reel and in less time than it takes to relate it his line was singing through the water, the surface of the lake around his canoe was seething and boiling, and those electric thrills which are so often referred to by well regulated and conventional fishermen were following each other in quick succession up and down the ossified railway of his spine, and permeating his whole nervous system.

Around and around the canoe went the excited fish in his mad rush for liberty, and so quickly did the startled fisherman have to turn in order to follow him that the surrounding hills and lake and sky all seemed to his vision to be blended together in one bright mass of coloring. Like a flash it dawned upon him that the fish, by its swift rotary course around the canoe, was endeavoring to overcome him with dizziness, and cause him to fall into the water, thus terminating the struggle.

Fully realizing the seriousness of the situation, with great presence of mind the fisherman maintained his equilibrium and succeeded in foiling the fell purpose of the maddened fish. Finding that it was thus foiled in its purpose, with eyes blazing with fury the fish sprang from the water and leaped at the throat of the fisherman and, narrowly missing him, fell into the water on the opposite side of the canoe with a loud splash. Again and again did the fish circle around the canoe, and again and again did it leap from the water and spring at the throat of the fisherman. But the fisherman, with steady nerve and calm courage, born of many desperate encounters with savage fish, evaded the onslaught of the fish by gently inclining his head from one side to the other as the fish sprang at him, thus allowing it to pass by him.

How long this struggle continued it is impossible to say, but the fisherman, realizing that it was an unequal contest—that the fish was in its native element and that he had only a frail canoe beneath him—decided to go ashore and there continue the contest. Skillfully guiding his frail craft to the bank, he succeeded in getting upon the shore, and by a skillful jerk just in the nick of time succeeded in landing the fish upon the shore beside him, and was foolish enough to suppose that the contest was ended. He was not long, however, in discovering his almost fatal error, for no sooner had the fish reached the shore than, renewing its attack, it rushed upon him and chased him up a tree. When the fish saw that the fisherman had escaped its rage and anger knew no bounds. It lashed the ground furiously with its tail, breaking down the bushes and scattering the leaves in every direction, and finally, in a paroxysm of fury, it died of rage at the foot of the tree.

The fisherman descended from the tree, and just at that moment hearing a couple of his guides coming over the portage, he called to them to come and help him in carrying the fish into camp. They quickly came to his assistance, and, gathering up the fish, it was discovered that it weighed just 1½ lbs. Overcome with astonishment at this strange and unaccountable discovery, and being much exhausted by the trying experience through which he had passed, and in addition to all this his lips and throat being parched, he reached around to his hip pocket in a kind of mechanical and, I think I may also say, a methodical way, and drew from it his flask. Slowly removing the stopper he placed the flask to his lips, but, to his utmost surprise and disappointment he found that it contained nothing. He remembered distinctly that he had filled it that very morning before leaving camp, and the only way that he could account for its unsatisfactory condition of emptiness was that in the whirling and sidelong motion which he had gone through in his protracted struggle with the fish, the contents had all spilled out.

In spite of the savage conflicts which take place between the fishermen and the fierce game fish, and which we cannot contemplate without some misgivings, there are a beauty and tranquillity about the woods, the mountains and the lakes that are delightful and inspiring.

I well remember taking a trip in our club territory many years ago during the early history of the club to a portion of the territory which was then almost unknown to the members, but which has since become a very familiar spot. The place which we visited was one of the larger lakes of the territory. A party had just returned from this trip, being the first club members to visit this lake, and we heard remarkable tales of the grand scenery on the way; of the dark and beetling cliffs which guarded the approach to the lake in question, and of the large fish that had gotten away from one of the members of the party while trolling through one of the lakes through which they had passed, all of which stimulated our desire to see this same country and other regions beyond. So we started without any unnecessary delay, and reaching in due time, about nightfall, a large lake adjoining the lake we were journeying to, we camped for the night. The following day was dark and showery, so that we did not break camp that day, but occupied our time in camp and fishing between showers on the lake on which we were camped.

Toward evening the clouds began to break away and the weather showed signs of clearing, and in order to

get an early start the next morning, we decided to have our canoe taken over to the adjoining lake. There was no portage cut between the two lakes, and we had to work our way slowly and painfully through the trees and underbrush, and partly along the bed of the stream which flowed between the two lakes, it taking us over an hour to travel the necessary half mile or so of distance. As we emerged from the woods and bushes along the sides of the tortuous stream, and came out upon the lake which we had been seeking, the sun had broken through the clouds and was sinking below the western hills which encircled the lake, casting a soft light over the landscape. The lengthening shadows of the mountains were cast far out upon the still water. Noiselessly the myriad trout were rising all over the lake, the tiny ripple spreading out in ever widening circles as far as the eye could reach. In the calm stillness of the evening hour all nature seemed at rest, and as I gazed upon that scene of tranquil beauty far from the abode of man my heart was filled with joy and peace.

It has been my privilege to see much grand and beautiful natural scenery since that time. I have seen the Alps, those eternal hills rearing their snow-clad heights to the sky. I have stood upon the summit of Mt. Washington and have seen the beautiful landscape beneath spread out like a scroll at our feet. I have looked from the highest peaks of Mt. Desert upon the beauties of mountain and sea; but that scene of peaceful beauty upon the lake, amid the solitude of the woods and mountains, which I looked upon over twelve years ago, is as fresh in my memory as if I had gazed upon it but yesterday, and I hope it will not fade as long as memory shall last.

C. P. C.

Strawberry Bass in New Jersey.

IN the May report of Fish and Game Protector Charles A. Shriner, of New Jersey, record is made of the importation and distribution of 82 white bass, 714 pike-perch, 254 strawberry bass and 30 channel cats. The report says:

The work of bringing the fish on from the West was intrusted to Wardens Riley, Kerr, Snyder and Hawkins, and I am satisfied that they did everything in their power to make the trip a successful one. Unfortunately, at Elmira the drawhead pulled out of the car, necessitating its being taken from the train and repaired. The Erie Railroad Company did everything possible, under the circumstances, the repairs being made promptly and the car attached to the next express train. The loss of fish was consequently far smaller than had been anticipated when the accident occurred.

On trips of this kind to Lake Erie it is impossible to designate the number and kinds of fish to be taken; the catch is affected by numerous circumstances—wind, temperature, the movements of fish, etc. The fish cannot be kept for any length of time, and sometimes several days elapse before a catch is made suitable for taking East. It will be observed that in the lot brought on during the last trip there were considerable numbers of strawberry bass, a fish hitherto a stranger to New Jersey waters. The wardens had been instructed to obtain these fish, if possible, in order to secure their introduction into the waters of New Jersey. Hitherto more attention has been paid to superior or larger kinds of fish, and the work would have been continued on these lines for some time had it not been that the last Legislature refused to make an appropriation for stocking purposes. Consequently the trip just made will probably be the last for some time to come, and to this the determination to bring on as many strawberry bass as possible was due.

I regret exceedingly that I was not able to fill all the applications made for fresh-water fish, as I had been in the hope of doing, and as I feel confident I should have done had it not been for the accident to the car en route. As it was, the fish were sent to points most easy of access, many of the fish, on account of the delay, being in anything but a good condition for further extensive traveling.

The strawberry bass is known throughout the West by a number of different names. It is frequently called the calico bass, and this name is more appropriate than any other, when the appearance of the fish is considered. It is also known in the West as grass bass, bitterhead, lamp-lighter and bank lick bass; in Lake Michigan it is invariably called the barfish, and in the southern part of the West it is referred to as goggle-eye or goggle-eyed perch. As a matter of fact, the strawberry bass, like the rock bass, the crappie and other similar fish, belongs to the sunfish family. The strawberry bass is of a bright gold and black, with numerous varying shades, being one of the most beautiful of fish. It is fond of grassy bottoms and quiet and clear water, and objects to mud. Although specimens weighing 2 lbs. have been found, it is seldom that the fish attains a size of more than 1 lb. It is very gamy on the hook, and rises readily to the fly. It is frequently confounded with the crappie, a fish it very much resembles in general appearance and structure, the principal differences being that in the crappie the white predominates where the gold is found in the strawberry, and that the latter is not fond of muddy bottoms, as is the crappie. Professor Kirtland, in George Brown Goode's "Fisheries and Fishery Industries of the United States," speaks as follows concerning the strawberry bass:

"The grass bass has not hitherto been deemed worthy of consideration by fish culturists; yet, from a long and intimate acquaintance with its merits, I hesitate not to pronounce it the fish for the million. It is a native of our Western rivers and lakes, where it usually resorts to deep and sluggish waters; yet in several instances, where it has found its way into cold and rapid streams, and even small sized brooks, it has adapted itself to the change, and in two or three years stocked to overflowing these new locations. As a panfish for the table it is surpassed by few other fresh-water species. For endurance and rapidity of increase it is unequalled. The grass bass is perfectly adapted to stocking ponds. It will thrive without care in very small ponds of sufficient depth. It will in no way interfere with the cultivation of any number of species, large or small, in the same waters. It will live harmoniously with all others, and while its structure and disposition restrain it from attacking any other but very small fry, its formidable armature of spinous rays in the dorsal and abdominal fins will guard it against the attacks of even the voracious pike."

To numerous inquiries in relation to the prospects of

a distribution of black bass during the coming season, I will say that in view of the expenses recently incurred by the purchase of quail, and the recent trip West after fish, the appropriation for stocking purposes is nearly exhausted, and it is doubtful whether enough will be left in the fall of the year to warrant resuming the work of netting the canals. In order to make the disappointments as few as possible, I made an application to the United States Fish Commissioner for a supply of these fish, and I am glad to say that a liberal allotment has been promised to New Jersey, this end having been attained through the influence of former Governor John W. Griggs.

The most important arrest of the month was that of Toni Poligino by Warden Pheasant. The warden had for some time tried to break up a custom of some Italians of throwing lime into brooks, and thus securing fish. His watching finally resulted in his catching the defendant, who was promptly convicted. Upon being sentenced he refused to pay the fine imposed, preferring to spend the money he had in securing counsel who had advised him that the law was unconstitutional, and that he would be released on habeas corpus proceedings. Counsel sued out a writ and gave four different reasons why his client should be released. The writ was returnable before Supreme Court Justice Van Syckel. After an exhaustive argument the judge sustained the law on every point, the result of which is that the defendant is now serving a sentence of ninety days in the county jail at Elizabeth, he having exhausted all his funds in legal proceedings.

The Landing Net in Pennsylvania.

PHILADELPHIA, June 14.—*Editor Forest and Stream:* Replying to your inquiry concerning the case in Monroe county, where parties were fined for use of landing nets in landing trout, Sec. 1, act of May 22, 1889, does not specifically permit the use of same, and the question must naturally hinge upon when a fish is actually caught. If not caught until landed, the words "any other appliances for the catching of fish except rod, hook and line" would bar use of the landing net; though the intent of the law was not to prohibit the landing net in common usage as its name implies, and its use in any other manner would be clearly illegal in trout waters except for the catching of bait fish for angling purposes, as provided in Sec. 6 of same act.

It is the consensus of opinion among anglers that the higher courts will permit its use for landing purposes after a game fish is actually hooked. The only solution of the problem pending decision is for anglers generally to avoid (as they should always do) any friction whatever with natives or residents of fishing localities; for it is not to be expected that anglers, one to another, would make use of this apparent oversight in the law except for spite.

I do not think the landing net will be discarded to any extent for the present, as this particular case takes its inception from motives prompted by local differences directly due to the unpopular practice of leasing waters, the exclusion of the public from fishing therein being, of course, a logical result of the lease.

Happily for those depending on public waters for angling recreation, a condition of affairs exists in most of the counties of the State different from that in Monroe and Pike. Public waters there have vanished like buffalo from the plains, or supposedly so, and differ over technicalities may be expected to arise.

These other sections of the State continue to let anglers as well as to value the expenditures they let. All are welcome, and I feel safe in saying the use of landing net for landing purposes would be unquestioned.

If the higher courts should decide against the use of the net, it must revolutionize tackle in this State until the next session of the Legislature, in that rods will need be pitched over ferrules ordinarily used in sea rods in order to "yank 'em" up the bank, all sizes, to keep within the letter and spirit of "rod, hook and line."

The gaff being technically "rod and hook," may come within the latter meaning as a last resort for the angler and a tip for the tackle dealer, since it is free from the word net, but I fear this is heaping sarcasm upon the salmon.

M. G. SELLERS.

Long Island Fishing.

QUEENSWATER, L. I., June 19.—The smaller weakfish have either left the bay or have all been caught by the net fishermen. The second run of large fish have, however, arrived, and have furnished fine sport for the experienced angler who knows how to catch them. One party consisting of Dr. Ruter, of New York City, and two other gentlemen, caught 192 weakfish in one day, averaging 2½ lbs. each. Fluke are biting freely, both in the bay and off to the fishing banks. Sea bass are also plenty at the banks. Crabs are getting more and more plentiful, and there is every prospect of their being caught in large quantities before the season is over. A large number of fishermen came down on Sunday. The largest catch to a boat was ninety fish, including an assortment of weakfish, bass and fluke.

Exterminating the Fish.

EAST ROCKAWAY, L. I., June 19.—There is serious complaint made by the line fishermen over the methods adopted by the professional net fishermen. During the past two or three weeks we had a great run of weakfish. They come into the bay by a narrow inlet several miles from the bay proper, and run up into the bay and adjacent channels. When the fish get up into these comparatively narrow channels they are easily caught by the nets of the fishermen, and are soon all taken. There are three gangs of net fishermen from Atlantic Dock; they fish almost every tide, and have been averaging from 800 to 1,200 lbs. of fish a day for each gang. It is safe to say that at least a ton of fish have been taken each day during the past month in the narrow channels and creeks at Hempstead Bay by the net fishermen. The line fishermen have good sport for the first few days after the fish arrive, but as soon as the fish work up the channels they are captured by the nets, and there is nothing left but straggling fish, mostly fluke and blackfish.

CHICAGO AND THE WEST

Camp "Forest and Stream" Tenth Annual.

NEWTON, Iowa, June 15.—This is the season of the year when J. B. H. and I have been accustomed to go into camp together. At about this time, for the past ten years, we have been used to take the little tents and the aluminum frying pan and the little axes and the gun barrel stove and our other dear belongings, and go into camp among the big oak trees which grow on the hill above our little lake. This year the little tents are still in the bags, and the stove has not been heated, and the axes have perhaps rust upon them. We hold our annual camp not by the side of the little lake this year, but at the bedside of J. B. H., here, where he is weary and has set down his burden for a while. They tell us that it may be some time before he goes upon other camps. Since I am with him, and since this is our camp, and since J. B. H. himself is a character of much more than ordinary interest, I feel more like writing of him than of other men and things.

Years ago, seventy and seven years ago, J. B. H. was born in old Virginia, where he grew up big and tall and strong in stature and strength far beyond the average man. In his prime he could lift clean off the ground the weight of 1,500 lbs. Once a man noted for his strength of hand wished to shake hands with J. B. H. for the purpose of testing his grip of hand. Seeing his treacherous purpose, this big Virginian, the kindest soul on earth, met him half-way, and taught him a lesson. He gripped his hand so felly that the blood burst from under the nails, and he punished weaker men no more. Fairly a giant in strength, J. B. H. was a Quaker by faith, and never disposed toward war of any sort. He never struck but one man in his life, and that one who told him he had lied. It was one blow, and the man barely survived it. Since then J. B. H. has said he would never use his hands again in such a way.

When J. B. H. was young, back in Old Virginia, he was powerful and fleet beyond the average youth. One winter day, when crossing a barren field, he started a rabbit, which ran away before him. There was a light snow upon the ground, and the young man was shod heavily, but he started after the rabbit, and the running being for some time in the open, he soon thought he could run it down in fair chase. So he ran and ran, and came up with the nimble game time and again. The rabbit doubled and dodged after its fashion, and J. B. H. could not kill it, though it was often at his feet. The blood stood red in his eyes, and often it seemed he must fall, but J. B. H. was wont to finish a thing once begun. He finished this race, and at last killed the rabbit. They found him lying in the snow, nearly blind, his clothing stripped from his chest and snow heaped on his neck in the fight for breath. It would be better for us all had the rabbit never sprung in front of the Virginia youth and tempted him to this trial. At that very time, in the opinion of J. B. H., he overtaxed his heart and hurt it permanently. Never till its owner was past three score years and ten did the stout old heart complain, but now they say it will never be itself again. Perhaps the races in the Western snows after crippled turkeys did it no good, for never did this natural hunter ever spare himself when the chase was asked. He was known all through the section of the West (whither, Virginia-like, he wandered later in life) as the most tireless and swiftest walker, the most indefatigable hunter, and the most powerful physical man in all the countryside. More than that, and better than that, he was known as the kindest and sweetest soul that ever misjudged humanity. His enemies he could have handled, had he ever had any enemies, and it only fell to him, as it has to many, to learn that it is one's friends who are most dangerous. Simple, kind and credulous, he could never, even till the very close of his business life, learn to believe that all men are not gentlemen, and as such worthy of trust and confidence. He was content to live so that all might think him worthy of trust and confidence. To-day the town and the country round about are waiting at his bedside. They have worn a smooth road in front of his gate where they have driven up to ask how J. B. H. is getting on. Last night, in the room near his bedside, I saw several persons who had come to ask for a look at the sick man. They were members of a mission class he teaches when he is well. I saw that they all were poor and ill clad. One of them was black. They all had tears upon their faces. These are the guests, this year, at Camp Forest and Stream. They are welcome, and they are prized.

It was early in his youth, when about thirteen years of age, that the father of J. B. H. gave him his first gun, a rifle, of course, for in that time and country no one cared much for the scatter gun. In the place where we camp this year, it hangs upon the wall, old, old and worn, the wood about the locks soft and rotted away, the set trigger grown very soft and risky of touch. It was a flint lock when J. B. H. first had it, years ago, when George Washington was a present memory in the Blue Ridge country. Then the old rifle was changed to a "pill-percussion" lock, and then altered to the percussion cap lock. In his hands this was a splendid weapon. But few men have ever gained more skill with the rifle than did J. B. H. In that country it was a crime to bring in a squirrel shot back of the ears. The rifle was used for all sorts of game. I am stating the truth when I say that J. B. H. once killed three quail out of five, flying, in the open stubble fields of Virginia, with the single ball from the old rifle. I know that when he came into the West—the West which was then a real frontier country, with Indians and deer and turkeys and other wild creatures—he would not use a shotgun for a long time. He killed many and many a turkey flying with this squirrel rifle, and always said it was not difficult to do. Yet he said that for some reason he had never killed a prairie chicken flying with the rifle, though it seemed easier than to hit a quail. Later on, when the long wagon trains crossed the plains, J. B. H. was one of the caravan, and there he killed his first buffalo, and that too with the old squirrel rifle, though he admitted that for such work the ball was light. This same old rifle I myself have often shot, and it is accurate to-day as ever, I presume, though I do not blame it for refusing to perform its best for any hands but those that first used it. It is a heavy gun, long and with a thick

soft iron barrel, yet heavy as it is, its weight in gold would never purchase it.

J. B. H. left his old home in the Short Hills of the old Blue Ridge, back in Old Virginia, long, long ago, very early in the 50s. He was one of the first settlers in the new land. He saw the West grow and change and learn that "progress" which means so much of deterioration. He saw the vast prairies fenced, and saw them come into the hands of aliens who never loved a gun. He saw the enormous abundance of the wild forests and streams changed to dearth and destruction by the senseless greed of those not fit to act for themselves. He saw the deer pass away, and then the wild turkeys, and at last even the swarms of prairie chickens, those beautiful birds which were so fit for that Western region, and which ought always to have been allowed to survive. No one cared for prairie chickens when J. B. H. came to this part of the West, but later on men hunted them. J. B. H. had one of the first and best of the bird dogs, and when he took up the use of the shotgun it was easy to his hand, where all guns fitted well. Two dozen quail, three dozen prairie chickens without a miss I myself have seen him do. In the old senseless way there was once a side-hunt, in 185—, and on one day J. B. H. killed many dozens of prairie chickens. From that day to this, though that was scores of years ago, he has never shot more than he could use of any sort of game. This was long before the days of game laws, but J. B. H. made game laws of his own. The doctrine we now promulgate and call correct and sportsmanlike, J. B. H. discovered independently scores of years ago, in a region where he was laughed at for his scruples and told that the game could never be exhausted. That, I take it, was a real sportsmanship of his, an instinctive sportsmanship, a real gentlemanliness, which makes J. B. H. very well worth writing about to-day.

It was my fortune to meet J. B. H. many years ago, and I learned of him most of my own notions of sport. It seems to me I at least had a good teacher, no matter what the pupil was. That was long before there was any FOREST AND STREAM, or any other sportsmen's paper. It was years ago that J. B. H. began to read the FOREST AND STREAM, and I doubt if any man ever read it more closely or appreciatively, though he would never commit to writing any of his own ideas. He held that a man was entitled to be a man, and have his own ideas, but need not suffer criticism if he did not flaunt them. How he regarded the FOREST AND STREAM (and this is why we put the name of the paper on our camp, even on this, our last camp) I may tell by a remark of his but a few days ago. "I do not think," said he, "that any Christian man need ever be ashamed to read FOREST AND STREAM, or to believe in it, for it teaches the doctrine of temperance and forbearance. I do not doubt it has done much to preserve our game." Perhaps he said this half in excuse as well as in conviction, his mind running back to the time when men were sometimes spoken of with slight for being lovers of the gun.

I recall one of the village anecdotes which may have some shade of truth in it. J. B. H. was once off on a camping trip, and he forgot to come back home on Thursday in time for the weekly prayer meeting, which was a circumstance hitherto wholly unknown in his history. On the following Sunday the minister invited all as usual to meet at this weekly prayer meeting. "I will be there," said the minister, "and the Lord will be there, and Deacon J. B. H. will be there—unless he goes a-fishing." This chagrined J. B. H. sadly, so the old story goes. But from that time to this the pew at the prayer meeting has always seen his face when he was within reach of home and able to be on his feet. He has been a good man, and has more than lived up to his professions. This is why the people come to his bedside—why the poor people, white and black, come in to look at the gaunt, gray figure that now lies on the bed in the camp Forest and Stream for this year. Alas! the old Virginian, the Western pioneer, the fearless and cheerful sportsman of many trails, I fear he could not to-day run down the rabbit in fair flight of foot. He could not even climb the big hill by the little lake, nor use the rifle, or even the rod, with his old zest and skill. The sun comes up, and the sun goes down, but it is not the shadows of the trees which we see, however like this may to the light reflected from placid waters. J. B. H. lies with his big hands—brown hands they are, even to-day—upon the covering, and all we can do is to talk of other days. If I could talk—if it were well to talk publicly in print—much of this, my idol and my ideal of the actual American sportsman and the simple, kindly gentleman, it might perhaps do other persons good. But J. B. H. would not like that. He isn't rich now, but is proud as when he had good store of worldly goods. Yet he has the old rifle that hangs there on the wall, and he has the clear mind of old, and, best of all, the conscience that has been always clear. He told me that he was not conscious of having ever intentionally wronged any human being, though he did not tell me this to say aloud. Now his big brown hands, once so strong, so useful, so kind, are idle, and his keen blue eye is paler, and his feet, once so tireless, have tarried for some days. But in front of Camp Forest and Stream, perhaps the last Camp Forest and Stream, the people have worn a smooth road where they have driven or walked or ridden often from many miles away, to ask how fares it now with J. B. H., old citizen and beloved friend. To these J. B. H. says that all is well.

If you wish to read of a sportsman and a man, read here. I do not know of any better, and you might have many worse than he to set a lesson for you, though it was always furthest from his way to preach to his fellows, or to set any lesson other than that of a simple, clean and steadfast life. Never a drop of liquor, never an oath, never a fear, never a reproach. There are possibilities in knighthood which I know are not outside the limits of a real sportsmanship.

Western Waters.

The bass are beginning to bite now a little, but nothing very big has been doing. The fact continues that this has been an unseasonable sort of year so far, with any number of storms and any amount of high water. Up in Wisconsin and Michigan it is a good time for lumbermen, but a poor time for trout fishers, for all the streams are on flood. Even the muscullunge waters are affected, and the heavier fish do not yet seem to be rising, though a number of small ones are recorded now and then from the

better known localities. I mentioned last week the little trip of Messrs. Von Lengerke, Nash and Lister to Hayward, Wis. They got only nineteen muscullunge, and the heaviest of these was but 9 lbs. As they were coming out of the woods on the last day of their trip, and at about 7 o'clock in the evening, they were surprised to see all the heavens, but recently nearly dark, lit up with a great glowing yellow light. Their guide was frightened and said that such a light meant no good, though he couldn't explain it. At the station they learned its cause. They had seen, at a distance of ten or a dozen miles, the lurid oriflamme of the cyclone, the same storm which swept New Richmond, Wis., from the map and killed nearly 200 persons. They passed through New Richmond going into their camp, but on getting this word they took train about by another road, and so missed a day's delay and the sight of many gruesome things. This same storm made torrents of all the streams of upper and western Wisconsin, and in more than one community set aside all thoughts of sport.

The lower country, such as Indiana and Illinois, is showing better fishing this week than Wisconsin. The bass are rising well in Indiana. Mr. Geo. Murrell and his friend, Mr. Crosby, of this city, have gone to Bass Lake again after big mouths. The Kankakee is a disappointment this year, a carful disappointment.

The Fox Lake chain, in upper Illinois, is offering a little fun these days, and the regular Saturday afternoon train of the Wisconsin Central road is taking out many persons, some of whom have the air of cognoscenti, and some that of picnickers. Among the fishermen to leave this afternoon were Messrs. H. English and J. A. Wood, who go to McHenry, and will try the Pistakee Bay waters above there. Messrs. Chas. F. Hills and Robt. Miller, both old-time bait-casters on the Fox Lake waters, will be on hand this week. It is rumored that there is a little test of skill on hand, in which Mr. Hills is concerned, and if so I am glad I am not the other fellow, for Mr. Hills is a mighty caster, with two hands and no glass arms.

E. HOUGH.

Full Creels in Canada.

THE steamship St. Olaf, which leaves to-night for Labrador and the north shore of the Gulf and River St. Lawrence takes down the bulk of the salmon fishermen who will fight the king of fresh-water fishes in the rivers that roll down to the sea, the snow water of the great northeast of arctic Canada. Mr. Chas. Stewart Davidson, to whom all true sportsmen owe so great a debt of gratitude for his efforts on behalf of salmon preservation in Canada, is on his way down to his newly-leased river, the Marguerite. Mr. Henry Russell, of Detroit, is also on his way down to the coast, and has received a telegram from his friend, Mr. Robt. E. Plumb, of Detroit, informing him that the latter killed his first salmon of the season this morning on the River Mingan. Mr. Geo. C. Jarvis left here last night for the Metapedia. Messrs. W. M. Macpherson, I. H. Stearns and Dr. F. W. Campbell, of Montreal, who are fishing their pools on the Restigouche, write that their sport has so far been greatly interfered with by the large number of logs in the river. Among other salmon fishermen who leave to-night for the north shore salmon rivers are F. S. Hodges, of Boston, who is on his way to the Natashquan; Dr. Henry S. Van Dyke, of New York; Phillip Schuyler, Gray Pollock, C. E. Chapman, M. S. Paton, H. S. Holt, Ralph Townsend and Mr. Peck, of Montreal. Edson Fitch and Veasey Boswell, of Quebec, and Mr. Toland, of Philadelphia, are enjoying good sport on the Moisie, and no information has yet been received here as to the success of the members of the St. Marguerite Salmon Club, now upon their river.

From Lake Edward, and in fact from all the lakes along the line of the Quebec & Lake St. John Railway, the spring trout fishers bring back marvelous reports. Lake Edward has returned as good a score of heavy fish as it ever did. The members of the Triton Club who have been up to their preserve seem to have been exceptionally fortunate. They found their biggest fish in Lake Batican. Albert Hiscock, son of ex-U. S. Senator Hiscock, took one of 8¼ lbs. He was accompanied by W. S. Andrews, of Syracuse. Judge Hiscock, of the Supreme Court, accompanied Douglas E. Petit and William Nottingham, of Syracuse, and twelve of their fish weighed 60¼ lbs. The two largest were 6½ and 3½ lbs. respectively.

Another party of Syracuse, who enjoyed some rare good sport at Lac des Passes, had a novel experience the other day. Near Starvation Point, which they had so named last year because they were disappointed there in failing to connect with an elaborate lunch that had been ordered for them, they left their fine city raiment, jewelry and other baggage a week or two ago, on entering the woods, as well as a general supply of provisions appertaining to a well-arranged base of supplies in a log camp which a day or two later was swept out of existence by a bush fire. The gentlemen who had thus to return home in their angling costumes were L. C. Smith, of the Smith Premier Typewriter Company; Judge Smith, of Chicago, and Geo. S. Rood and Geo. S. Larrabee, of Syracuse.

The annual meeting of the St. Bernard Fishing Club was held at Lake Saccacoma Camp on Monday, June 5. General Wm. H. Henry, president, in the chair. It was voted to increase the membership of the club to forty, and the following officers were elected: General Henry, President; C. G. Williams, Secretary; James W. Brock, Treasurer; Committee on Membership, W. H. Henry, James W. Brock and Chas. H. Wilson.

Mr. Gregory, president of the Triton Club, has returned home to Syracuse from a delightful visit to the club waters, in which he was accompanied by Judge Kennedy and Dr. Mooney. The Judge, despite his eighty years, and over half a century's experience of fishing and camping in the woods, can cross a portage and cast a fly with many a much younger member of the craft.

The very best fly-fishing for ouananiche ought to be close at hand. The fish are making their appearance in the Grande Discharge, and the steamer Mistassini has commenced its daily trips across Lake St. John. By Thursday or Friday next the best angling of the year ought to be fairly open to visitors, and the third and fourth weeks of this month and the first two or three weeks of July will see it at its best.

E. T. D. CHAMBERS.

QUEBEC, June 10.

A Gulf Capture.

SCENE.—The village of Tarpon, Mustang Island, or, as down on the maps, "Aransas Pass, Texas."
Time.—Early morning.
Subject.—Fisherman.
Object.—Fish.

ALL night long had I dreamed of it, and as I emerged from the primitive dining room of the little seaside hostelry, and was cheerily greeted by the Boniface after an early breakfast, I felt sure that the day would prove propitious.

For a week I had tanned in the soft Gulf winds, and for a week also I had daily sought the blue-green waters of the Pass, casting, trolling and deep-sea fishing. Daily had I felt the mighty tug of the foraging tarpon, and daily had I witnessed the sight of the magnificent great-eyed herring as it breached—vomited, as it were—from the clear waters, its muscular length hanging for a moment in mid-air like the arc of a silver crescent cut gleaming against the sapphire sky.

Daily had I fought for my prize. My stubby rod had bent like a whip, and my line had cut the water with a prolonged swish, while reel had whizzed and whizzed until its revolutions had sounded like the wind a-crescendo through the wires of an Eolian harp. I had tugged, and reeled in, and the tarpon had tugged, and reeled out, and the same end came in every instance—the tarpon escaped.

Broken pole, broken line, broken hooks and broken heart. Each had marked the outcome of the contest, and now, as I once more gazed at the wonderfully alluring vista, I felt that success must at last rest upon my efforts, for this day marked the close of my brief vacation.

A pleasant breeze was roughening the face of the inner bay, and there was a slight swell coming through the Pass, breaking ponderously on the rock jetty and curling smoothly upon the brown sands of the beaches. The offing was clear and a loud-mouthed bevy of tern made merry music as they dove for minnows near the inner point.

My boatman was wading in the shallows casting his net for bait, and as I left the hotel, and with my tackle, and strode energetically down the long wharf, Dan dropped the leads of his net into the bow of his boat and there came the sound of small fish flopping, and I knew then the bait was safe.

"Fine day for tarpon, Dan," I hazarded, mildly, for Dan was a great fisher of fish.

"Couldn't be better," came the reply, as Dan bent to the oars and forced the flat-bottomed skiff from the cove into the Pass. "Saw a school break just afore you came, sir, an' they're feeding mighty hard this morning. Guess we'll land a big fellow to-day and break our hard luck."

This was consoling, and I confess to a feeling of enthusiasm as I heard the water ripple beneath the bow and considered the prospects. I always liked to hear Dan talk that way, and although his optimistic prophecies did not always materialize, they were nice to listen to.

The mullet kicked vigorously as I hooked it through the lips. This was natural, but as I made a cast and let the line fly out some 60ft., it fell into the yeasty crest of a small wave, and the mullet concluded there were better times coming, for I saw a little fellow swimming blithely, as if he were not on a big hook and baiting for larger quarry.

"Guess we'd beter take the tide," remarked the boatman as he let his oars drop. "The fish are running out, and we can drift and give your bait a chance to drop."

I agreed with Dan. I always did in such matters. We allowed the little craft to drift easily along, my line sinking and the stiff current giving it a pull that kept my thumb on the brake constantly, and my senses on the alert for the anticipated strike.

The man who has occupied a like position can well understand the feeling that then takes possession of the fisherman. Each pressure on the line, the tremble of the blue passing water, the gentle movement of the bait, even the slight surge of the boat as it rises on a swell, each constitutes a portion of the whole, and in each, for the moment, the expectant angler finds the waited-for strike, only to realize the following instant that he has been mistaken.

I was sitting quietly thus meditating, when suddenly, as is always the case, there was a stiffening of the line, and the next instant came a musical whirr of the reel as it rapidly revolved under the pressure. The rod bent as I bore on the brake to set the hook, and then there was a quick slackening of the line, and Dan's voice came to me, as it seemed, out of the distance.

"Get ready, sir, he's going out of the water."

Dropping the point of the rod to bring the weight of the steel snood on the fish's mouth, I raised my eyes in time to see the voracious and splendid creature fly into the heavens, his great silver scaled sides glistening in the sunshine as head and tail bore toward each other. Then down he came. The water dashed skyward in a gleam of scintillating fragments, and once more the line tautened and the reel clicked and clicked until a hundred yards had gone to the worse, when the rush ended and the strain let up.

"Now's your chance," yelled Dan, eagerly, as he "backed water." "Reel in while he's restin'."

Maybe I didn't reel, but I did, wondering all the while that the fish did not again break, and it was only when the empty hook rattled disconsolately against the sides of the boat, that I ceased wondering. The tarpon had, to use the vernacular of the day, "flew the coop," and once again was I left swearing at fate and very much disgusted.

"Never mind, sir," consolingly chimed in my boatman, "first one off, second one on," and with this cheery reflection ringing in my ears, I mechanically baited and threw my hook into the bubbling waters and prepared for the fortune the fates should accord.

The sun grew into the heavens as we slowly drifted seaward. By this time the Pass was dotted with the boats of other fishermen, and in a fury of disgust I witnessed the skillful landing of a 6ft. tarpon by the man with a record. So intent was I upon this performance that I forgot my own line, when I was aroused into action by the sound of my reel flying loose and a series of exclamations from Dan.

"Put on the brake," he shouted excitedly, and as I in-

voluntarily pressed my thumb to the rubber, there came a series of fierce irresistible tugs that made the line smoke and the rod bend with the terrific strain.

"Holy smoke, what is it?" I queried with amazement, watching the wire-like line stretching into the deep waters of the pass.

"Say, Dan, the thing ain't going to leap," I added, and all the while the line was going steadily out, although I had a pretty heavy pressure on the brake, and Dan had given the boat way, following the fish.

"Hit her hard, Dan," I yelled, "or the dod-blasted fish will get every inch of line I have on the reel."

Dan struck several fierce licks with the oars and gradually the strain lessened as the skiff plunged ahead. It was no use trying to reel in, however. The fish, whatever it was, figuratively, had the bit between its teeth, and it set the pace with a vengeance, heading directly out to sea. Visions of liver-colored devil fish, monstrous squid, sperm whales and the Lord knows only what, flitted through my mind as I felt the awful vibration of the rod and realized my inability to take an inch.

I had been forced to edge up, clambering almost over Dan's back until I reached the bow of the boat and knuckled myself into the angle with feet braced and teeth firmly set. My arms began to ache with the terrific pull, and my senses were on the qui vive, for I feared each moment either line or rod would give way. Dan was hard at work with the oars, and was too busy for speech.

At last, when it seemed that an hour must have elapsed, there was a slackening of the line, and I reeled in with a speed born of desperation. Only for a moment, however, when the rush began again, the fish making a wide circle and changing his course into the inner bay, something I was glad to notice, for had it continued seaward, nothing could have prevented its ultimate escape.

Heading in, brought us against the current, and we were going heavily—like a new car with an underground trolley—and still the line pointed bottomwards and the quarry evinced no desire to ease up. Sheering first in one

TOWED IN.

direction and then in another; tugging with intense earnestness, jerking and towing—the thing on my hook continued its mad career while I alternately gave or took line, and Dan sweated at the oars.

I knew I had not hooked a tarpon. That much was certain, but what I had hooked, was so far a mystery that even so experienced a fisherman as Dan, in a brief breathing spell, announced his inability to solve. Whatever it was, it was a whopper, and in that fact I felt reasonably hilarious, and even complacent, in spite of the probability of its escaping after all, and that my limbs ached from the prolonged exertion.

We had been gradually veering toward the beach and shallow water. I was in hopes by this procedure to gain upon the fish and bring it to the surface. I was considering the probabilities contained in the proposition when the strain on the line slackened for the second time. I reeled rapidly for a minute and gained fully 20ft. of the line, when the water parted a score of yards ahead of the boat and a great brownish-black mass rolled heavily on the surface, threw up a vast volume of spray, and then disappeared, but not so quickly but that Dan had seen it.

"Jew fish," he tersely remarked.
"Jew fish," I echoed; "well it's big enough to suit me, jew fish or whale."

I had not time for further reflection, for the line again stiffened, but to my satisfaction, the rush of the fish had ceased for the time being, and soon the line was nearly perpendicular, the boat floating almost above the quarry.

"He's sulking," said Dan, and I soon realized what he meant, for nothing I could do resulted in budging the fish an inch, and I began to despair.

"Give him the rod with a steady strain," suggested my fish-erudite boatman, and acting upon this suggestion, I bore heavily upward with brake set, and waited developments.

This was more than the jew fish could stand, and in less than five minutes he came from his anchorage as sluggishly as a captured pig, giving up the fight, and with all his strength and massive bulk, falling victim to a 27-strand cuttyhunk, and a hook that seemed like a toy within the broad cartilage of the wondrous mouth.

Not daring to use the gaff, Dan gently worked the boat into the beach shallows, and until the form of the leviathan grounded clumsily upon the sands, gasping and resigned to its fate.

Leaping into the water, Dan struck the gaff into the exposed gill and slid our capture safely beyond danger of escape, bending the while beneath the weight of the fish.

Then, and only then, did I breathe easily, and as I gazed upon the creature that had given me so much exertion and so much anxiety, I felt that the laurels were mine, and that disappointment was no more. Tarpon had I lost, but

jew or June fish, I had gained, and in the comparison, nothing was missing.

The beast was 9ft. in length, and weighed a trifle less than 750lbs., nearly all good meat and ugly enough to have satisfied anyone.

I learned that only once had my capture been exceeded in size, and the record then had been a thousand pounds. "Jew," or June fish, similar in many respects to those great deep-sea bass caught off the Cataline Islands on the Pacific Coast, are more or less common in the waters of the Mexican Gulf, and are caught from Yucatan to Key West; but on the Texas coast, from Brazos to Velasco, the fish are greatly in evidence and, in fact, are frequently caught by the coast fishermen and served in the chief Texas cities.

Seldom, however, does it fall to the lot of an angler to land with rod and reel, so great and so massively magnificent a member of the family, but in the warm waters of Aransas Pass, game of all description is abundant, and the ardent disciple of Walton finds everything grist that comes to his mill.

H. M. MAYO.

New England Fishing.

BOSTON, June 19.—Moosehead Lake fishing continues good, with brook trout rising to the fly in a very satisfactory manner to those who do not expect to catch bushels of trout at every outing. Mr. Walter L. Hill has just returned from his annual fishing trip to that celebrated lake. He was accompanied by H. B. Kirk, of New York; W. H. Morrison, of New York; James Murphy, of Boston; James A. Greeley, Jr., of Boston, and E. M. Farmer, of Arlington. They had good fishing, "taking all the trout reasonable fishermen ought to want," says Mr. Hill. All were taken on the fly.

Mr. Louis A. Aspinwall and Dr. Cutler, of Boston, have been on their regular annual trip down the river, below Providence, for tautog. They did not have the success of a year ago, the run of tautog having gone by, or some other reason, for exactly which the fishermen are somewhat at a loss. But they got over a dozen tautog, and had a good trip. One little adventure concerning their bait is worth noting. Generally they use mussels, but this time they were bound to try fiddler crabs. The night before they "baited up" a place on the shore with scraps of meat and other kitchen waste, and a little later they could catch the little fiddlers by suddenly jumping upon them, before they had time to get under the rocks. In this way they secured a tin pail full. The cover was put down tight, giving the little fellows only an occasional chance to breath as they went down on the steamer. That night the tautog fishermen stopped at a hotel. After supper they thought that they would stroll through the little town a while, leaving their pail of bait in their room with the cover just loosened a little, in order that the little crabs might not stifle. When they returned to their apartments the girls and everybody were excited. The little crabs had lifted the pail cover and were disporting themselves over the corridors and stairways in profusion. They were taking particular delight in bumping down stairs, evidently bound for the water. The fishermen gathered up all they could, but it was some time before quiet was restored. Many of the other guests were afraid of fiddler crabs in their rooms, and generally the beds were thoroughly looked over before the occupants "turned in."

It seems that Big Bario Lake, Nova Scotia, is becoming noted for its trout fishing, though some of the first to find it have been keeping as still about it as possible. A party of Bostonians, consisting of Charles E. Tingley, Dr. Kellogg and William E. Gray, have secured control of 400 acres of land on the borders of the lake. The only other camp there is that of Mr. Frank F. Dodge, of Boston, established two or three years ago. This year, on his annual trip, with Mrs. Dodge and son and Mr. Robert L. Pond, good success was had. The morning of their departure they fished Silver River, taking a string of 105 brook trout. The Boston party first mentioned has named its camp Graykelting. It is said that fishing rarely fails in this section. While there are moose in the woods, no deer are noted. Big Bario is generally reached via Yarmouth; thence to Weymouth by rail, then a six-mile walk to Silver River, and thence by canoes. There are other ways across the country.

The Thames party has just returned from a fishing trip to Moosehead. In the party were F. W. Thomas, C. W. Hinman and F. J. Davis, of Boston; Henry B. Leach, of Toronto, and A. H. Whitney, of Ashburnham, Mass. The gentlemen fished five days, and made a most remarkable record, including 94 togue, or lakere, and 124 brook trout. The total weight of their string was 360lbs. The largest brook trout taken weighed 3½lbs., and was taken by Mr. Whitney.

Considerable catches continue to be reported from the Rangeleys. Mr. G. W. Mitten, of Boston, stopping at the Birches, has taken two salmon of 4½lbs. each, and eight good-sized trout. Dr. L. T. Foss, of Boston, is having a camp built at Birch Island. Good fishing is reported at Kennebec Lake. J. S. French, of Boston, is having good success there.

The salmon fishermen are getting started. Mr. C. H. Barnes has gone to his preserve on the Restigouche, where he will be accompanied by Col. Stackpole and Mr. F. C. Fitch.

The Maine Fish and Game Commissioners gave a hearing Saturday at the Upper Dam, Me., on a petition that the pool below the dam be closed to all fishing after sunset till sunrise, from Aug. 15 till Sept. 30 each year. The claim is made that a great many trout, especially large ones, are destroyed by night fishing, and often by questionable means. Rather curiously the signers of the petition, responsible parties, did not appear at the hearing, much to the disgust of the Commissioners. It is reported, in fact, that the Commissioners had to send out for some one to represent the petition. After considerable delay it came out that the long-time guests and fly-fishermen do not favor the proposition, while guides and residents of the State are in favor of some rule that shall prevent the annual destruction of big trout that takes place there, especially after they begin to gather at the spawning beds. The claim is made that the large male trout are inclined to fight everything that comes near to the beds, especially at night, and hence anything like an artificial fly or bait that is dropped near is seized. It is certain that some-

thing must be done to prevent so many trout being taken late in the summer and fall, especially at the Upper Dam, or Rangeley fishing will very soon be where that of the Adirondacks is to-day. The Commissioners, at the close of the hearing, reserved their decision.

Alexander H. Wood, of Boston, died at 7 o'clock Saturday evening. Mr. Wood was well known and much beloved by anglers who have had the good fortune to know him. Both a trout and salmon fisherman, he made many visits to favorite waters. A fishing friend of Grover Cleveland and Joseph Jefferson, he was interested in trout and salmon waters with them. Born in Kelso, Scotland, sixty-four years ago, he early acquired a Scotchman's love for the angle. At the age of twenty he came to America, and as soon as success in a mercantile life would allow, he gave time and attention to his favorite pastime.

Mr. and Mrs. Henry B. Stowell and Mr. and Mrs. N. Brewer, of Lynn, have been having great success bass fishing at the Gables, Mt. Vernon, Me. Strings of 50 and 100 bass a day have been made, some of the fish going up to over 3lbs.

SPECIAL.

Staten Island Fishing.

GIFFORD'S, S. I., N. Y., June 19.—One of the pleasant surprises of the season is the number of weakfish which are caught here every day. The fishing began very early this year, and the fish are caught in large numbers. Last Wednesday Mr. Fred Sibley, of New York, got fourteen fine weakfish, and on Saturday Mr. Winfield Provost, of Hackensack, N. J., and two friends, took eighteen home. On the same day Mr. Samuel Beatty, of New York, caught a dozen, averaging about 2lbs. each. On Sunday the fishing was not so good, due, no doubt, to the cool spell of the past few days. Nevertheless, the usual pleasant gathering of ladies and gentlemen took place, and nobody grumbled because there were no fish.

The company here is of the pleasantest; everybody is good natured whether there be good fishing or none at all, and Mrs. Collins and her obliging young lady assistants do all in their power to make pleasant the stay of the stranger within their gates.

G. F. D.

NEW DORP, S. I., N. Y., June 19.—Weakfishing has just begun here, the first fish of the season being landed early last week. The fish were large, weighing about 3lbs. each. Will keep you posted as to the fishing here.

CAPT. G. W. PETELER.

Lake Winnepiseogee.

A FRANKLIN FALLS, N. H., correspondent reports the taking at Lake Winnepiseogee, in two days' fishing, of thirty-five trout and a salmon, the string weighing 150lbs., by Messrs. M. M. Fitzgerald, C. L. Eddy and A. S. Ashworth.

Dog Lore.

My old friend and shooting companion Jake is the possessor of a young dog mostly of the setter persuasion, whose doings have been very interesting to note. The day when Cap and I first became acquainted was cold and blustery, and the scattered birds found in the high woods were wild as hawks. This was the dog's first experience, and his owner was anxious to overcome his gun-shyness, which had before been noticed.

From the start he took considerable interest in his work. The few shots fired in the woods, and fortunately not very close to him, did not cause him any annoyance. Soon, however, we approached a clearing, where two farmer boys, who escorted us at their own suggestion, discovered a rabbit. They proceeded to shoot after poor "Mollie" with their muzzle-loaders charged with black powder. A third discharge of their artillery was too much for Cap, and he came by me at a determined dog-trot toward the barn where our team was hitched. Coaxing had no effect, so we allowed him to give us the go-by. An hour later, when we returned to the barn, we discovered Cap in the wagon, with a half-grown chicken, which he had seized en route, and without damage to the bird. This he was playing with very much as a cat with a mouse. Just why he, who had not possessed the reputation of a "chicken dog" before, should have chosen this time for game practice caused considerable comment.

I next heard of him last spring, when Jake's good lady attempted the raising of a brood of ducks, with a hen as mater. While the young birds were in the yard, he would station himself between them and the creek, and for a time managed to keep them away from the water. They finally evaded him and reached the creek. Then he was kept busy plunging in and bringing the birds to the house and his mistress, with the feet of the little swimmers only visible as they fanned the air in vain efforts to escape. Each bird was carefully deposited before Jake or Mrs. B. with an air of having done quite the proper thing; nor could he seem to understand that he had not saved each duck from a watery grave. However, the incarceration of the birds in his mouth soon wrought its work, as the little things were almost smothered, and they hardly survived a second trip from the creek.

This occurred on a place stocked with chickens of all sizes, which he never molested, unless they happened to wander into the feed house. Should they do so, and Cap

discovered them, there was a quick and noisy scatteration.

His last effort to immortalize himself occurred a month ago, when his master secured a dozen quail for breeding. The crate containing the birds was placed on a barrel in a large room, where Cap and his father, a dog "of credit and renown," soon located them. They were greatly excited over their find, and it required some work to get them out of the way while Jake was hitching up his team preparatory to distributing the birds on the farms, fully two miles away. The dogs were fastened up until he was well started with the birds, which he released by pairs. A couple which had died on their journey from the West were also thrown out from the wagon into a swampy spot on one of the farms.

Both dogs were awaiting Jake's return, having discovered in the meantime that the birds had been removed. As soon as the team appeared, they took the back track at a clipping gait. Within less than two hours they returned, Cap holding in his mouth one of the dead birds which his master had thrown away in the swamp. This was easily identified from its condition and shape, as it had been trampled flat by the other birds before it was removed from the crate. Cap's satisfaction at his bit of work was unbounded. If the previous examples of his mentality are clever, we must consider this last feat remarkable. Yet, in the language of truthful James, "I state but the facts." As between reason and instinct in dogs, I favor the former. To those who care to work out the mental processes involved above, paraphrasing our Revolutionary hero, I say, "If this be reason, make the most of it."

SCAIBE.

PHILADELPHIA.

Points and Flushes.

The Philadelphia Dog Show Association, recently admitted to the American Kennel Club, will hold a dog show in Philadelphia during next November, and have claimed the 15th, 16th, 17th and 18th as dates.

- 26-29. Sea. Cor., cruise to New London and return, L. I. Sound.
28. Mosquito Fleet, open, South Boston, Boston Harbor.
28. East Gloucester, cup, Gloucester, Mass.

JULY.

1. Wood's Holl, sprit and cat class, Quissett.
1. Quincy, club, Quincy, Boston Harbor.
1. Eastern, annual, Marblehead, Massachusetts Bay.
1. American, annual cruise, Newburyport to Boston.
1. New Rochelle, annual, open, New Rochelle, L. I. Sound.
1. Columbia-Defender, New York, New York Harbor.
1. New Jersey-Knickerbocker, cup, Bayonne, Newark Bay.
1. Beverly, Cor., Monument Beach, Buzzard's Bay.
1. Burgess, club, Marblehead, Massachusetts Bay.
- 1-4. Williamsburgh, an. cruise to Cold Spg. Harbor, L. I. Sound.
1. Winthrop, hand sweeps, Winthrop, Boston Harbor.
1. Savin Hill, open, Savin Hill, Boston Harbor.
1. Corinthian, Phila., knockabouts, Essington, Delaware River.
2. Penataquit Cor., snipe class, Bayshore, Great South Bay.
2. Stamford, annual, open.
- 2-5-6. Seawanhaka Cor., 20ft. trials, Oyster Bay, L. I. Sound.
3. Atlantic, cruise, rendezvous at Larchmont; 5, Larchmont to Black Rock, Black Rock to New London; 7, New London to Shelter Island.
- 4-5-6. Chicago, trial races, Canada cup, Chicago, Lake Michigan.
4. Larchmont, annual, open, Larchmont, Long Island Sound.
4. Boston City, open, South Boston, Boston Harbor.
4. Corinthian, Marblehead, club cham., Marblehead, Mass. Bay.
4. Wollaston, Burgess cup, Wollaston, Mass.
4. East Gloucester, club, Gloucester, Mass.
4. Pavonia, club special, Communipaw, New York Bay.
4. Newport, annual, Newport, Narragansett Bay.
4. Jamaica Bay, club, Jamaica Bay.
4. Quannapowitt, club.
4. Wood's Holl, sprit & cat classes, Wood's Holl, Hadley Harbor.
5. American, annual, open, Milton Point, Long Island Sound.
5. East Gloucester, club, Gloucester, Mass.
6. Indian Harbor, special, Greenwich, Long Island Sound.
7. Sea Cliff, open, Sea Cliff, Long Island Sound.
8. Riverside, annual, open, Riverside, Long Island Sound.
8. Jamaica Bay, dory class, Jamaica Bay.
8. Corinthian, Phila., knockabouts, Essington, Delaware River.

THE London Times describes the new Shamrock as follows:

"The hull of Shamrock is made of a new alloy of extreme lightness and strength. Nothing could be smoother than the under-water surface it makes. The yacht is unlike the later challengers in many respects, but the model, except in the matter of draft, is largely that of the 52-rater Saint, though it embodies much of what was successful in Ailsa.

"The following are her dimensions: Length over all, 125ft.; length on load waterline, 89ft.; beam, 22ft.; length from bowsprit end to main boom end, 190ft. Her draft is 19ft. gin., and the height from deck level to topmast head is 138ft.

"It is improbable that she will race on this side the Atlantic."

The beam, 22ft., is less by a couple of feet than the yacht was supposed to have, but it is doubtful whether the Times figures are correct.

The Yachting World says:

"Further unexpected difficulties have been met in the construction of the Shamrock, and though none of them will permanently affect the boat, they have delayed the work so that her launch is impossible before the last day of the month, and some modification of the arrangements for the sailing trials have been rendered necessary by the delay in her construction. The only thing yet absolutely fixed is that when she is launched she will be taken to Fay's yard, at Southampton, to be finished there. All her

standing and running gear is completed, and it is expected that, once launched and her masts stepped, her outfit will be finished in a day or two."

Out of the many vague reports current there is nothing known to a certainty. The yacht will probably be launched about the end of June. She may sail some informal trials with Britannia, but there is no likelihood of any such thorough trial and tuning up as the American yacht will undergo.

Up to the middle of last week it was expected that Columbia would be ready for trial by June 18 at latest, but this was found to be impossible. The tender St. Michael's went to City Island and brought a wooden boom of De-fender to Bristol, to be used in the trial; but it is probable that the new steel boom will be ready by the middle of this week.

It was expected that Columbia would be ready for her first sail on June 21, but an unexpected cause of delay appeared at a late moment. The blocks are largely of aluminum castings, made at a foundry at Warren, about four miles from Bristol. When they were tested in the machine last week they failed, both in the shells and sheaves, so that it was necessary to make new and stronger ones. This will cause a delay, and it is not yet known when the first trial will take place. The 64ft. topmast was sent up on June 19, and most of the rigging is in place.

The Canada Cup.

ON June 10 the first of a series of three races for the McFarlin cup was sailed off Charlotte by the Rochester Y. C. The race was a drift, only three yachts, Verona, Genesee and Iris, finishing. Verona, the 27-footer purchased in Hamilton, beat Genesee by a few seconds, but the race was no test. On the following day Genesee sailed from Charlotte for Buffalo, and on her arrival there she was swung aboard a steamer to be taken to Chicago. Prairie was due at Chicago about June 17. She passed Detroit in tow of Vailima on June 13.

The following paragraph has been sent out as news from Chicago, and published in many papers. It evidently refers to the yacht launched some six weeks ago, and fully described at that time:

CHICAGO, June 15.—Another international racer has been launched for the trial races in this city. The supplementary contests, which will last for a week, will begin on July 4, and are for the purpose of selecting a craft to uphold the challenge of the Chicago Y. C. for the Canada cup. The name of the 35-footer last launched is the Josephine. She is a modified bulb keel, 26ft. on the waterline and 47ft. over all, and spreads 1,500ft. of canvas.

Thus far but four yachts have been reported as built for the trial races—Genesee, Prairie, Josephine and Veva. It is now reported that the Racine Boat Manufacturing Company has a 35-footer ready for Mr. George Warrington, of Chicago.

The newspapers on both sides of the line are already exchanging compliments, as follows:

CHICAGO, June 16.—At the present time there are three Canadian cup defenders in the water. The Canadians are preparing a warm defense for the Chicago Y. C. when it goes to Toronto in August to bring back the Canada cup. Of the three boats, there is but one that is seriously feared by the Chicagoans, and that is Duggan's Toronto. Duggan has a reputation for building boats with an ability to get over the water like a hungry greyhound going after a fat rabbit. His boat is a centerboard, and is said to be built on the principle of one-raters—rather on the skimming-dish pattern, and as fast as it is able to make 'em. The Toronto has lead on the centerboard, with a lead shoe on the bottom. She has no inside ballast, and at present is being fitted out with three suits of sails.

That Fearnside boat, the Hamilton, is now in commission, but those who have seen her do not express any great admiration for her. Canadians who would like to see the Chicago Y. C. win out say that there will be nothing to fear from the Hamilton. She is shy considerable lead on her keel, and will not be able to show her heels to any one unless this is remedied, so they think up north.

The first Canadian boat in the water was the Myrtle, and since her launching she has done nothing to set the world afire. Like the Hamilton, she needs more lead on the keel, and even with the additional ballast will not be fast enough to win out, the critics say. She is rated as about a match for the Erma.

Hamilton.—Reports from Rochester are to the effect that in the first of a series of yacht races, off Charlotte, for the Fisher cup, the Rochester Canada cup challenger Genesee was badly beaten by the Verona, a 27-footer built by Weir, of this city, and sold last year to a Rochester syndicate. As the cup defender now being built by Mr. Weir is expected to prove many minutes faster than the much smaller Verona, it would appear that the Genesee, at least, of the American challengers, might as well be counted out of the game.

Royal Hamilton Y. C.

HAMILTON—BURLINGTON BAY.

Saturday, June 10.

THE first race of the new 35ft. class on the Lakes was sailed at Hamilton on June 10, the starters being the fin-keel Hamilton, designed by J. H. Fearnside, and the fin-keel Myrtle, designed by Wm. Burnside. The two yachts are new and but recently launched. Hamilton carried an old and small suit of canvas belonging to the old Nadia, her new sails not being ready. Myrtle had her new canvas. Under the circumstances the race cannot be considered as a fair test. The wind was light from the east. The times were:

35ft. Class—Start, 2:35.			
	Finish.		Elapsed.
Myrtle	5 21 45		3 48 45
Hamilton	5 31 28		3 58 23
Skiffs—16ft. Class—Start, 3:00			
Sothis	4 57 50		1 57 50
Flight	5 01 10		2 01 10
Sara	5 02 05		2 02 05
Rippah	5 05 45		2 05 45
Amah	5 08 20		2 08 20
Sheila	5 08 10		2 08 10
Sultana	5 14 30		2 14 30
Thetis	5 15 45		2 15 45

Yacht Designing.—XXXII.

BY W. P. STEPHENS.

(Continued from page 458, June 10.)

PROBLEM VIII.—To describe an arc of given radius through two given points. Let A and B, Fig. 82, be the given points; set the compasses to the given radius, and from A and B in turn describe the short intersecting arcs, which will give the center of the circle. From this center with the same radius as before describe an arc which will cut the two points.

Problem IX.—To find the center of a given circle. Let ABC, Fig. 83, be the circle; draw any chord, as AB, bisect it and draw the perpendicular CD, the diameter; bisect this to find the center E.

Problem X.—To find the center of an arc of a circle. Let ABC, Fig. 84, be the arc; from any two points, A and B, with a convenient radius, describe four intersecting arcs, and repeat the process with the opposite points B and C. Draw through these intersections the lines DE and GF, which will intersect at the center of the circle H.

Problem XI.—To describe an arc of a circle through three points when the center is not accessible. It is frequently necessary to lay out a portion of a circle of such large diameter that it cannot be swept by anything in the nature of the compasses, beam compasses or trammels; as in the case of the deck beams of a large vessel. Several methods are used, the principal ones being as follows:

First Method—Mechanical.—At two points of the required circle, AB, some distance apart, pins or nails are driven, as in Fig. 85. Two straight rulers are then fastened firmly together at such an angle that, when each is in contact with one of the pins, the intersection of their outer edges, C, coincides with a third point of the required arc. The point of a pencil is then held firmly at the intersection, and the rulers are moved, being always in contact with the pins, describing an arc of a circle. The apparatus may be made in permanent form, adjustable to any circle, the two rulers being hinged at C with a brace and clamping screw to hold them in the required position.

Second Method.—Let ADB, Fig. 86, be the required arc, as for instance when the chord AB represents the length of a deck beam and the distance CD the round up of the beam. Draw BD, and at right angles to it BE; also DE parallel to AB. Divide the half chord CB into any number of equal parts, as at 1, 2, 3; and DE into the same number of parts, $1^1, 2^1, 3^1$. Join the corresponding points of division 1, 1^1 , etc. Draw BF perpendicular to AB, and divide it into the same number of equal parts as CB, as at a, b, c. Draw the lines Da, Db, Dc; the intersection of 1, 1^1 and Da, of 2, 2^1 and Db, and of 3, 3^1 and Dc, will be points of the required circular arc.

Third Method.—In Fig. 87 draw DB, and from C the line CE perpendicular to DB; lay off FE equal to FC; then the angle EDB will be equal to the angle CDB. Divide CD and DE into any number of equal parts. Draw BG perpendicular to AB and in length twice CD, and divide it into the same number of equal parts. The intersections of 1, a, 1^1 , B, etc., will be points of the curve.

Fourth Method.—Let AB, Fig. 88, be the length, and CD the round. From C, with a radius SD, describe the arc D, a, b, c, E. Divide CE into any number of equal parts, as at 1, 2, 3; and CB and the arc DE into the same number, at a, b, c. Also divide CB at $1^1, 2^1$ and 3^1 , and erect perpendiculars at each point. Take the distance 1, a with the dividers and lay it off on $1^1, a^1$, and the other distances on their corresponding perpendiculars, $2^1, b^1$ and $3^1, c^1$; the points a^1, b^1, c^1 , will lie in the required curve. This method, and another similar one, but still less accurate, are only approximate; but the error is small when the span AB is great in comparison with the rise CD, as in the case of a deck beam; and the operation is simpler and shorter than the preceding ones.

After one-half of the required arc has been described by one of the above methods, the same operation may be repeated for the other half; but the same end may be attained more speedily and easily by erecting perpendiculars at corresponding points of each half, as in Fig. 86, and transferring the distances already found in the first half to the proper positions in the second.

Problem XII.—To describe a parabolic arc through two points. Let A and B, Fig. 89, be the points, and AC a tangent to the required curve. Draw CB and divide it into any number of equal parts, and divide AC into the same number. Erect perpendiculars at each point of division on AC, and join each point on CB with A by the lines A, 1^1 , etc. Number the divisions of AC from A and those of CB from B, as shown; the intersections of the lines having similar numbers, 1, 1^1 , 2, 2^1 , etc., will be points of a parabolic curve tangent to AC at A.

Problem XIII.—To describe a curve of *versed sines*. Let AB, Fig. 90, be the base of the required curve and AD its height. Bisect AD in C and from this center describe the semi-circle passing through A and D. Divide AB into any number of equal parts, and also the semi-circle AD into the same number of equal parts. The distance A, a, the *versed sine* of the arc A, 1^1 , is set off on the first perpendicular, 1, a^1 ; the distance A, b, the *versed sine* of A, 2^1 , is set off at 2, b^1 , and each of the other distances from AB to the points of division of the semi-circle is set off on its perpendicular, giving a series of points on the required curve. This curve is symmetrical, the half BE being an exact reverse of DE, the two being tangent at E; while the curve is tangent at B to the base AB, and at D to a line parallel to AB. It is the easiest and most natural curve by which two parallel lines can be united. It is familiar by name to the tyro in designing in connection with the well-known investigations and theories of the late J. Scott Russell and with the now accepted theory of the curve of areas that has replaced them.

Problem XIV.—To describe a *trochoid*. The *trochoid* is a fuller curve than the *curve of versed sines*, and while, in theory, the latter is used to govern the disposition of the displacement in the fore body of a vessel, the *trochoid* is used for the run or after body. Its construction is similar to that of the *curve of versed sines*, as in Problem XIII., up to a certain point; but after the *versed sine* is set off, as at 1, a^1 , Fig. 91, the *sine* of the arc a, 1^1 , is set off horizontally, giving a point, a^{11} , on the required curve. In actual construction, after the arc AD and the

FIG. 84

FIG. 85

FIG. 86

FIG. 87

FIG. 88

FIG. 89

base AB are divided, lines are drawn from A through the points of division of the arc A, 1^1 , A, 2^1 , etc., and a line parallel to each is drawn through the corresponding point of division; thus a line parallel and equal in length to A, 5^1 is drawn through 5 and similarly through the other points.

In dealing with any curve too large to be described by instruments, a number of points on the curve are located by means of measurements according to one of several methods. The simplest method is by means of what are termed *rectangular co-ordinates*, or *abscissas* and *ordinates*; the position of each point being determined by its distances from two given lines. Thus in Fig. 90 the point b^1 may be located by measuring the distance A, 2 along the line AB, and also the distance 2, b^1 vertically from AB. The two lines AB and AD are known as the *co-ordinate axes*, the horizontal line AB being called the *axis of abscissas*, and the vertical line AD the *axis of ordinates*. The distance of a point from the *axis of ordinates* measured on a line parallel to the *axis of abscissas*, is called the *abscissa* of the point; and similarly, the distance from the *axis of abscissas*, measured parallel to the *axis of ordinates*, is called the *ordinate*. Thus the *abscissa* of the point b^1 is the distance b, b^1 , or its equivalent, A, 2; and the *ordinate* of the same point is 2, b^1 or A, b.

The term *ordinate* is in constant use in designing, indicating the distance of a point from a line. Usually the line is horizontal, as in the sheer and half breadth plans, and the distances are measured vertically; but in some cases, as in the body plan, the ordinate may be the horizontal distance along a level line from the vertical center line.

In the case of the curve DEB, Fig. 90, the *abscissas* would be the distances A, 5, A, 4, etc., along AB, and the ordinates the distances 5, d^1 , 4, c^1 , etc., measured on the perpendiculars through the different stations.

In *analytical geometry*, from which the terms *abscissa* and *ordinate* are derived, the *abscissas* are measured from AD on or parallel to the line AB of indefinite length. In naval architecture the line AB is always assumed to be of a definite length, as for instance the load water line, and to be divided into an even number of equal parts. While the term *ordinate* is retained to indicate the distance of a point from some given line, the term *abscissa*, which would practically indicate the distance along the line at which the measurement was made, is dropped. In place of it the term *interval* is used to indicate the length of the equal parts into which the line is divided, while

the points marked by the intervals are called *stations*. In this way any curve may be readily measured, recorded and reproduced. A straight line is drawn in the general direction of the length of the curve. This base line is divided into a number of equal parts, perpendiculars are drawn to meet the curve, and the distances from the base line to each intersection are measured.

A New Interclub Challenge Cup.

THE following circular has been sent out by the Eastern Y. C.:

BOSTON, June 10.—To Members of the Eastern Y. C., the Regatta Committees of the New York, Seawanhaka Corinthian and Larchmont Yacht Clubs—Gentlemen: The Eastern Y. C., by its regatta committee, proposes to offer for competition a challenge cup substantially on the conditions stated below, and cordially asks you to send to us before June 30 any suggestions you may have to offer which would tend to produce better sport or a clearer understanding of the terms.

1. The Eastern Challenge cup is offered by the Eastern Y. C. as a perpetual challenge cup for competition by the New York, Seawanhaka Corinthian, Larchmont and Eastern yacht clubs, and such other American yacht clubs, having stations on salt water, as may from time to time be added to this list by the consent of the majority of the clubs already upon the list.

2. The yachts in competition shall always be single-masted vessels, with centerboards or fixed keels, with a waterline length not less than 39 nor more than 46ft., with a racing measurement not exceeding 51ft., according to the rules of the club holding the cup at the time of challenge, and with fixed ballast (including its fastenings) not less than 20,000lbs.

3. No frames, beams or plating of such yachts shall be of any metal other than iron or steel.

4. All challenges shall be in writing, and received before Jan. 1 of the year of the proposed race by the club then holding the cup.

5. Before April 1 the club holding the cup shall determine and announce the particular conditions of the races, which shall occur between Aug. 1 and Sept. 30.

6. Each challenge shall be decided by winning a majority in a series of three or five races, to be alternately triangular and windward and leeward, each leg to be not less than eight nautical miles in length.

7. In case of several challenges for one year, the order of sailing the respective series may be determined by lot, and the winner of each series shall defend the cup against the challenger of the next appointed series; the winner of the final series to be the winner for the year. Each series in one year shall be at the place appointed by the club to which the challenge was sent, and under their rules and management.

8. Before July 15 each challenging club shall notify the challenged club of the name and ownership of the yacht they have selected to represent them; and within one week thereafter the challenged club shall announce the name and ownership of the yacht they have selected to defend the cup against each challenge.

9. The parties to any challenge may agree upon any terms not inconsistent with paragraphs numbered 2 and 3 of this deed of gift; and, excepting this paragraph and the paragraphs 2 and 3, the terms of the deed may be amended in any year between Oct. 1 and Dec. 1 by vote of three-fourths of the clubs then eligible to challenge. By vote, at any time, of all the clubs then eligible to challenge the entire deed may be changed.

10. If for any reason the club holding the cup at any time should be dissolved, the cup shall revert to the club which last previously held it.

Please address any suggestions, before June 30, to the Regatta Committee, Eastern Y. C., Marblehead, Mass.

HENRY H. BUCK, Chairman,
HENRY HOWARD,
ODIN B. ROBERTS,
EBEN B. CLARKE, Secretary,
95 Milk street, Boston,
Regatta Committee, E. Y. C.

East Gloucester Y. C.

EAST GLOUCESTER, MASS.

Saturday, June 17.

THE East Gloucester Y. C. sailed a special race on June 17 in a light breeze, the times being:

First Class.		
Alethea, Colby & Tolman.....	1 23 41	
Rambler	1 32 11	
Second Class.		
Snap Shot, Perry.....	1 35 04	
Tuton	1 59 05	
Third Class.		
Witch, Higgins.....	1 08 22	
Imp	1 08 39	

Baltimore Y. C.—Ramsay Cup.

BALTIMORE—CHESAPEAKE BAY.

Saturday, June 10.

THE Baltimore Y. C. sailed a race on June 10 for a cup presented by Vice-Com. Ramsay. The wind was fresh N.E., and the times were:

	Start.	Finish.	Elapsed.
Albatross	10 58 48	1 11 38	2 12 50
Nepenthe	10 58 15	1 25 10	2 26 55
Flossie	10 58 10	1 29 40	2 31 30
Seymour	11 01 00	1 45 50	2 44 50

As the yachts had not been measured, the winner is not known.

Cohasset Y. C.

COHASSET, MASS.

Saturday, June 17.

THE Cohasset Y. C. sailed its first race of the knock-about championship series on June 17 in a fresh S.E. breeze. The times were:

	Finish.
Eleanor, F. W. Moors.....	5 26 10
Delta, R. G. Williams.....	5 26 30
Nereid, W. R. Sears.....	5 27 35
Baracuta, Albert C. Burrage.....	5 30 01
Remora, Crocker & Tower.....	5 31 20
Heralda, A. Bigelow, Jr.....	5 32 24

The Yankee—Dominion Match.

DORVAL—LAKE ST. LOUIS.

June 12-15.

THE international match on Lake St. Louis last week furnished good sport for both contestants and created a good deal of interest among yachtsmen throughout the country. Naturally, one side was defeated, but after sailing the match to a conclusion the visitors showed their spirit by a frank admission that they had met a faster boat. They took their defeat philosophically and without complaints and lamentations over exceptionally bad weather.

The match was made last fall, in answer to a challenge from the White Bear Y. C., of White Bear Lake, Minnesota, to the Royal St. Lawrence Y. C. Immediately after the victory of Dominion last August, when it was rumored that the Seawanhaka Corinthian Y. C. would adopt retaliatory measures against the Royal St. Lawrence Y. C. for having admitted the double-bilged yacht Dominion as its representative in defending the Seawanhaka international challenge cup, the White Bear Y. C. sent a challenge for the cup; in fact, a representative of the club visited Dorval personally for that purpose. Later on, when the Seawanhaka C. Y. C. decided to challenge again for the cup, it brought such influence to bear on the Royal St. Lawrence Y. C. that the White Bear challenge was declined and its own accepted. Shortly after this the White Bear Y. C. sent a new challenge to the Royal St. Lawrence Y. C. offering to race Dominion with the champion White Bear yacht of the year, Yankee; both yachts to be sailed in precisely the same trim and rig as in 1898. This second challenge was accepted, and Com. James Ross, of the Royal St. Lawrence Y. C., offered a handsome cup as a prize. The conditions of the races, as to measurement, crews, courses, etc., were identical with those of the Seawanhaka cup races.

The yachts have been too frequently described to warrant a repetition. Both are freaks of the most extreme type, Yankee being a scow with a flat bottom, while Dominion has a hollow fore and aft of her bottom, making two individual and distinct bilges. Her lines were published in the FOREST AND STREAM of Oct. 1, 8 and 15, 1898. The two were very carefully overhauled and polished, but no alterations were made in hulls, rigging or sails.

As already recounted, the White Bear yacht and a number of members of the club arrived at Dorval in the week preceding the races, and on Saturday, June 10, Yankee and Dominion were both under way during the day. In the evening a party of over fifty dined at the Dorval club house as the guests of the Royal St. Lawrence Y. C., among them being Capt. Ordway, Messrs. C. M. Griggs, F. M. Douglas, W. S. Morton, T. L. Wann, W. J. Murray, P. C. Stohr, J. W. Taylor, O. L. Taylor, H. T. Drake, J. E. Ramaley, F. L. Wanklyn, Prof. Capper, James Paton, W. J. Joseph, J. J. Riley, Jr., F. P. Shearwood, G. H. Duggan, G. A. S. Hamilton, C. H. Routh, J. C. C. Almon, W. M. Torrance, G. R. Marler, W. A. C. Hamilton, R. Lindsay, J. Rae, Mr. Monk, W. L. Hogg, W. Davidson, A. McKim, Geo. Boulton, W. B. Chapman, T. E. Vasey, R. Fitzgibbon, W. P. Stephens, A. W. Morris and Shirley Davidson.

In the absence of Com. Ross, Mr. F. L. Wanklyn presided. Toasts were drunk, songs sung and speeches made, the evening passing very pleasantly.

First Day, Monday, June 12.

The steam yacht Dama, Vice-Com. Stephens, acted as committee boat, while the Duchess of York carried the club members and guests, including a party of ladies and gentlemen from the White Bear Y. C. The course for the first race was to windward and leeward, starting off Pointe Claire. Monday morning was almost calm. The boats towed to the line at 11 o'clock, but there was not wind enough to warrant a start. As they sailed about, Yankee showed a very long gaff and large mainsail, while her large jib had the head cut off square and laced to a bamboo yard about 18 in. long. As far as appearances go in this class, she was clumsier and even less of a yacht than Dominion, which is saying a good deal. The two were manned as follows:

Yankee.—L. P. Ordway, captain, 143½; F. M. Douglas, jib, 162½; J. A. Ramaley, main sheet, 151½; C. M. Griggs, cockpit, 142½. Total, 600.

Dominion.—G. H. Duggan, captain, 152; F. P. Shearwood, jib, 149; W. A. C. Hamilton, main sheet, 140½; Ed. Boulton, cockpit, 144½. Total, 586.

Yankee's crew had been so close to the limit of 600 lbs. that some training was necessary to get them in.

At 2:15 the preparatory signal was given, the wind by this time being strong enough for a start, from S.W. Ten minutes later the starting signal was given, Dominion going over the line first, to windward of Yankee, both on starboard tack. The water was smooth and the wind variable in force, but gradually increasing. Dominion increased her lead steadily from the start, and had a couple of minutes clear at the windward mark:

Dominion2 59 28 Yankee3 01 28

They ran down wind with a little gain for Yankee, the end of the round being timed:

Dominion3 16 03 Yankee3 17 17

On the second round the S.W. wind was strong enough to kick up a sea, which hindered Yankee, and she lost several minutes, the outer mark being timed:

Dominion3 45 40 Yanke3 50 32

Dominion set her spinnaker, but the pole fell and let the sail into the water for a short time. Yankee set hers very promptly. The wind fell on this leg and shifted to the south, so that spinners came in and balloon jibs were set. The end of the second round was timed:

Dominion4 05 20 Yankee4 10 50

Dominion gained 38s. on the run, giving her a lead of 5m. 30s.

The last round was sailed in a light and variable wind that gave no tests of the boats. Yankee gained a little on the windward work, and lost a great deal by the wind's vagaries on the last leg. The outer mark was timed:

Dominion4 38 35 Yankee4 43 30

The finish was timed:

	Elapsed.	
Dominion	5 09 32	2 44 32 0 09 58
Yankee	5 19 30	2 54 30

Second Day, Tuesday, June 13.

There was a hot sun on Tuesday morning, but a lively S.W. wind, and plenty of sea. The course was triangular, the first leg S.W. toward Isle Perrot, the second in toward Beaconsfield. The start was made at 1:02:22, both boats having two reefs turned in and second jibs set. Though Dominion was first over the line, Yankee was close on her weather quarter, and in a good berth. In a very short time, however, Dominion served her as she did Challenger last year, walking out from under her lee and broad across her bows to a windward berth. When about half way to the first mark, Dominion shook out her second reef; Yankee held her well, however, and was but 45s. astern at the turn, the times being:

Dominion1 22 33 Yankee1 23 18

Running down the wind, Dominion failed for a time to pick up the second mark, and overstood a little. Yankee gained on her, and they turned the second mark together:

Dominion1 34 07 Yankee1 34 12

They jibed at the mark, and Dominion's starboard backstay fouled the spreader and was not set up, her mast going over the side. The White Bear men offered to call the race off, but they were ordered by the committee to sail the course, which they did, finishing the second round at 2:40:15, the race being awarded to them. Dominion was taken in tow for Dorval, and on arrival there a new mast was promptly shipped in readiness for the next day.

Third Day, Wednesday, June 14.

The wind on Wednesday was N.E., at times quite fresh and then falling. The start was made off Beaconsfield, the windward mark being off Pointe Claire. When they got away, at 1:28, Dominion led, but with Yankee on her weather quarter. As on the preceding day, Dominion soon worked out a lead, and at the weather mark she was 2m. 55s. ahead, the times being:

Dominion1 50 04 Yankee1 52 57

On the run Yankee picked up a little, the end of the round being timed:

Dominion2 08 20 Yankee2 10 36

There was more wind on the second round, but Dominion made very little gain; she failed to fetch the mark, and had to make a short hitch. The times were:

Dominion2 29 15 Yankee2 32 05

The run home was made in a lighter breeze, the round being finished:

Dominion2 48 05 Yankee2 51 49

The last round was sailed in a light wind, the outer mark being timed:

Dominion3 10 15 Yankee3 13 53

The finish was timed:

Dominion3 27 30 Yankee3 30 08

Fourth Day, Thursday, June 15.

What proved to be the final race was sailed on Thursday, over the triangular course in a wind that was from the N.E., but variable both in direction and force, at times dropping to a calm, at other times giving the crews all they wanted in the way of hiking exercise. The day was cloudy and unpleasant, and it rained from the start almost to the finish. The triangular course was sailed, to the Beaconsfield mark first, a reach; then a reach to the Isle Perrot mark, and a beat home, three rounds.

The start was given at 1:54, Dominion crossing first. Both carried balloon jibs. Dominion gained on the first leg, the times at the turn being:

Dominion2 09 15 Yankee2 10 00

They jibed over and carried the ballooners to the second mark, where they were timed:

Dominion2 22 00 Yankee2 24 45

It was now dead to windward, and in a fresher breeze. The two were separated in the tacking, and for a time Yankee had all the wind she wanted; the end of the round, however, showed a gain of 1m. 55s. on this leg for Dominion, or 4m. 40s. for the four miles.

Dominion2 42 10 Yankee2 46 50

On the next leg the wind fell light and shifted so far to the east that spinners were set, the rain meanwhile falling heavily. The times at the Beaconsfield mark were:

Dominion3 01 00 Yankee3 07 00

They set balloon jibs on the reach to the second mark, and the wind freshened at times, Yankee picking up 1m. 23s. The turn was timed:

Dominion3 13 00 Yankee3 18 23

Dominion made the last leg without a tack, but Yankee got in a short hitch at the beginning, which was unnecessary. The end of the round was timed:

Dominion3 24 20 Yankee3 29 02

Dominion had a lead of 4m. 42s. at the start of the third round, both setting spinners. Though the rain finally stopped at this time, the wind died out with it, leaving Yankee to drift. The first mark was timed:

Dominion3 44 45 Yankee4 03 35

On the next leg this fluke was reversed, Dominion being becalmed while Yankee made up 12m. on her; the second mark being timed:

Dominion4 11 25 Yankee4 17 45

The last leg was a close reach, but at the line Dominion had to make an extra tack. Yankee gained on this leg, so that the finish was timed:

Dominion4 29 10 Yankee4 31 32

Dominion won by 2m. 22s., making her the winner of the series and the owner of the Ross cup. Yankee was shipped back to White Bear Lake on the following day.

On Saturday evening, prior to the departure of the Western yachtsmen, a dinner was given by them to Mr. Duggan, on board the private car, those present being Captain Ordway, Mr. Oscar Taylor, Mr. Murray, Mr. Reid, the designer; Mr. Ramaley, the builder of Yankee; Mr. Douglas, and Messrs. Wm. Davidson and W. B. Chapman, of Montreal. After the dinner, at 8 P. M., the car started west.

Morrisania Y. C. Annual Regatta.

CASANOVA—LONG ISLAND SOUND.

Sunday, June 11.

THE Morrisania Y. C. sailed its fourth annual spring regatta on June 11, the course being from Casanova, East River, around the Gangway Buoy, for the larger yachts, and around the Stepping Stones for the smaller. There was a fresh breeze at the start, but it soon fell, and the greater part of the race was a drift. The times were:

Class A—Sloops Over 30ft.	Length.	Start.	Finish.
Florence, G. Schroeder.....	34.06	11 51 00	4 20 00
Yankee, A. W. Strong.....	34.00	11 52 00	6 00 00

Class B—Sloops—25 to 30ft.	Length.	Start.	Finish.
Water Lily, McLoughlin.....	27.02	11 58 00	5 28 00
Connie, G. Ollweiler.....	27.02	11 58 15	5 56 00
Gracie S., R. Sheppard.....	27.01	11 54 00
Peerless, C. Hendricks.....	27.05	11 58 10	5 44 00

Class C—Cabin Jib and Mainsail—17 to 25ft.	Length.	Start.	Finish.
Psyche, D. Macherwirth.....	21.03	12 08 00	4 40 00
Iolanthe, C. Marshall.....	22.09	12 09 00	3 27 05
Niagara, J. Meyer.....	24.07	12 09 00	6 04 00

Class D—Open Jib and Mainsail—17 to 25ft.	Length.	Start.	Finish.
Mamie K., E. Kiel.....	22.06	12 14 40	5 07 00
Sport, H. Booth.....	19.02	12 16 30	5 06 00
Ideal, J. Coldrum.....	19.00	12 14 30	3 42 00

Class E—Cabin Cats—25 to 30ft.	Length.	Start.	Finish.
Aller, J. Nafis.....	25.10	12 02 50	5 25 00
Lou, Geo. J. Oakes.....	28.04	12 03 05	4 33 30
Allegro, E. Miller.....	26.00	12 20 00

Class G—Open Cats—17 to 25ft.	Length.	Start.	Finish.
Fairy, C. Look.....	20.06	12 20 30
Pastime, E. V. Bergin.....	18.10½	12 20 28
Venus, J. Sassenscheid.....	18.01	12 20 50	4 14 00
Genesee, J. Cadogan.....	22.00	12 21 20	4 06 00

Class H—Open Cats—Under 17ft.	Length.	Start.	Finish.
Henry, C. Algoever.....	16.10	12 26 50	2 15 00
Teresa T., J. Toole.....	17.00	12 29 50
Mamie R., M. Rehm.....	16.10	12 28 00
Little Dean, N. Rae.....	16.00	12 30 00	2 13 00
Captain, A. Armstrong.....	16.07	12 31 00	2 03 00

The winners were: Class A, Florence; Class B, Water Lily; Class C, Iolanthe; Class D, Ideal; Class E, Lou; Class G, Genesee; Class H, Captain.

Burgess Y. C.

MARBLEHEAD—MASSACHUSETTS BAY.

Saturday, June 17.

THE Burgess Y. C. sailed its thirtieth annual regatta on June 17 in the afternoon, following that of the Corinthian Y. C. in the morning. The wind was fresh, and a good race resulted, the new Peep winning in the raceabout class. The times were:

Royal Canadian Y. C.

ON June 10 the Royal Canadian Y. C. sailed a cruising race from Toronto to Niagara, the starters being Canada, Merrythought, Vivia and Vreda. Merrythought beat Canada by 11m. 15s., the others not being timed. On the same day a race was sailed in the bay between Wona, the old Burgess boat, and Sylvia, the times being, start 3:00:

	Finish.	Elapsed.
Sylvia.....	5 05 25	2 05 25
Wona.....	5 37 01	2 37 01

Government Model-Making.

THE following interesting description of the model of warships and their construction is from the New York Times. The business is an art in itself, delicate and expensive beyond the ideas of the casual spectator who sees these models on exhibition:

Not many days ago the Washington papers gave an account of the accidental death from asphyxiation of James A. Marceron, an aged modelmaker employed for many years at the Washington Navy Yard. Interest in the announcement was increased by the statement that he had constructed many of the models of warships shown in the halls of the Navy Department, most of which have been seen at the different expositions in the country since the department began to make a collection of models to illustrate types of ships added to the navy.

Marceron had been employed by the Navy Department for many years. Long before the full models now made were manufactured, he helped to construct the half models formerly constructed, but since the custom of making full models, complete in every particular, was adopted, and the force was increased from two or three modelmakers to a force sometimes as large as twenty men, he had been only one of many model constructors, some of whom are very skillful.

The model shop, which is a part of the Bureau of Construction and Repair, and under the direction of Rear Admiral Hichborn, Chief Constructor of the navy, is a part of an ancient shiphouse in the Navy Yard. It is in the northwest corner of the house sheltering the marine railway, up which is now and then hauled a small vessel needing to be docked and renovated. There is a suite of rooms, running alongside the new model tank on one side and overlooking the lofty interior of the shiphouse on the other side. Once there was a smell of oakum and clutter of stores about the place, but the odor of the oakum has departed, and there are few stores about now to make a clutter. At the end of the dock the Fern, a little vessel that was greatly in evidence a year ago, is tied up to wait the use of the District Naval Militia, and not far away are the battered trophies brought from the wrecks of Cervera's fleet.

Two of the rooms in this model department are ordinary offices, with an odd cupboard or two that seem to be old. Further back are the workshops. Against the walls of the workshops there are some old half models of hulls, one an unnamed large vessel, designed for steam, but having the lines of a sailing ship. Near by is the model of the Jamestown, now a training ship, her fighting days long passed. Upon a bench is another model, the oldest in the place. It is a finely made half model of the old ship-of-the-line United States, with a proud bow and elaborately carved stern, her sides pierced for twenty-eight guns, and room aboard for fifty. This is a fine specimen of the oldtime model. Upon another bench, drawing near to completion under the hands of the latter-day modelmaker, is a miniature battleship Iowa, glistening with red below, and creamy white above the waterline. From keel to truck, from stern to stern, she is in little an exact copy of the warrior cruiser that alone left 4in. marks on three of the armored cruisers of Cervera.

It is a beautiful piece of work. As it is still in the workman's hands, not yet protected by the glass case soon to be put over it to exclude the dust and the curious fingers of admiring crowds, it may be examined closely, and it is seen that the features to be found on the designer's drawings are all to be found in the model. Bilge keels, hawse holes, gangways, sponsons, shutters, armor, stanchions, auxiliary engines, cranes, davits, skylights, steam launches, the whole outfit of boats, everything to be found on the real Iowa, is faithfully reproduced here, so that one might not be surprised to find that the model was a practicable one, and that the wicked little 4in. guns might presently bark out a salute or a disastrous broadside.

This little battleship, so pretty in its red, white and buff, with brasswork all aglow, is almost as fine a piece of construction as a watch. Indeed, much of the minute work upon it was constructed with jewelers' tools and put together with all the care of a timepiece. The hull is made of pine wood, carefully selected for the purpose. With the blue-print designs from the Bureau of Construction before him, and working on a scale of 1/4 in. to the foot, the builder lays first the keel-piece, then carves out another plank to make a horizontal section of the hull and glues it firmly above the keel-piece, and by successive layers, each carrying approximately the shape of the hull for a new section, wood is added until the hull model is completed. As the solid hull would be unnecessarily heavy, parts of it are made hollow, but enough is solid to give the hull immunity from shrinking.

Rough edges remain after the shaping and building up of the hull, and these are carefully finished off with knife and plane and glass and sandpaper before the paint is applied. Meanwhile other modelmakers are at work. The guns of different calibers are made from the finest steel. Their mounts are built in exact imitation of the big mounts constructed in the gun foundry. The stays, cables, awning and other fixtures are prepared, as none of these articles can be purchased from any trade stock. No one carries imitations of anchor cables in stock. A laughable story is told by Chief Constructor Hichborn concerning the first attempts to get men to work skillfully upon the minute parts of the models. A man was assigned to make the chains for the anchors of the Charleston, the first of the modern models made for the Navy Department. He received material and tools, and with instructions as to how the cables were to be made, he went at his work. Three days afterward he went to the Chief Constructor. "Chief," said he, "I want to be discharged." "What is the matter?" inquired Mr. Hichborn. "Well," said the man gloomily, "I don't like my job." "Why do you dislike it?" inquired the surprised Chief. "Well," explained the man, "I started three days ago to make chains. I had finished up a lot of links and left them on a paper on my bench. Last night somebody left the window open, and the wind blew the papers and links out, and I can't find them. I want to be discharged." The Chief laughed at him, and asked him to go back and begin over again, but to see thereafter that his window was shut when he was away.

Just "off the ways" in the model ship is a miniature copy of the new Kearsarge. The hull is made, and cavities in the deck show where the double turrets will be inserted that will carry the 12in. and 8in. guns. When the Iowa is off the bench and out of the hands of the finisher the Kearsarge will take her place, and before the Paris Exposition is ready for opening it is possible that the whole miniature fleet of the United States vessels will be across the ocean, to show the visitors to that exhibition some of the vessels which won for the navy in 1898 the prestige it is now enjoying. The model fleet is one of types rather than a complete reproduction of the ships of the navy. It includes in the completed and incomplete list the battleships Kearsarge, Iowa, Massachusetts, Maine and Texas; the armored cruiser New York, the ram Katahdin, the monitors Monterey and Miantonomah, and the cruisers Atlanta, Baltimore, Charleston, Columbia, Newark, Olympia, Yorktown, Bancroft, Helena, Nashville, Petrel, Annapolis and Wheeling. There is also a model of the torpedo dynamite vessel Vesuvius, and one of the old Kearsarge.

The models are expensive. The largest (like the New York and the Columbia) cost \$7,000 each, the smallest about \$2,000, including the cases. While the expense seems to be a good deal, amounting up to date for the fleet of models, something like \$75,000, the Navy Department does not consider it money wasted. From the time the first model was made, and it was shown at distant interior points, the models have been the best exhibit to the people of the growing navy. Talk about "big ships" is all very well, but not until a large number of people in the interior saw the models of the battleships did they seem to be anything more than mere names and expensive promises of power. Some of the Representatives in Congress from interior States would have prevented the construction of the expensive battleships if they could have had their way. The exhibition of the models and their explanation by naval officers who exhibited them, weaned the Western voter from the idea of economy at any cost of National pride, and as they have traveled about the country the models have proved to be eloquent lecturers to and proselyters of the men who had been led to believe that this country had no use for battleships, and was not likely to get into war with those who were spending money for such expensive luxuries. Pride in names, too, has had something to do with increasing interest in "our" ships, so that before Dewey and Schley and Sampson had made the fighting record for the navy the inland citizen was prepared to take a very keen interest in the movements and achievements of naval vessels, small and great.

The completed models are to be seen, ordinarily, in the hall in the main entrance to the Navy Department in this city, and in the hall above, just outside the door to the reception room of the Secretary of the Navy. The New York, Massachusetts, Columbia and Maine have the most conspicuous positions. The model of the Maine is not quite satisfactory, as it was made before the final changes in the vessel and therefore is not a correct reproduction of the battleship as she was when blown up in Havana Harbor. The model has three masts, while the Maine had but

two. The models of the Maine, Yorktown, Petrel, Baltimore and Newark were made before the order was given by Secretary Whitney for painting the ships white. They are painted black above and red below the waterline, while all the later vessels are in white, red and buff.

Larchmont Y. C. Spring Regatta.

LARCHMONT—LONG ISLAND SOUND.

Saturday, June 17.

THE annual spring regatta of the Larchmont Y. C. on June 17 promised to be a fine race, with the new Acushla II. entered against Syce and Kestrel and good entries in other classes. Unfortunately there was so little wind that the fleet barely covered the shortened courses, and the times show nothing of the merits of the boats.

Shackamaxon Y. C. Annual Regatta.

PHILADELPHIA—DELAWARE RIVER.

Sunday, June 11.

THE twelfth annual regatta of the Shackamaxon Y. C. was sailed on June 11, the course being around the Wheat-sheaf Buoy, twenty-nine miles, with a time limit of seven hours. A fresh N.W. wind hurried the yachts down the river and a shift to the south brought them home. The times were:

Fourth Class—Duckers—Start, 11:53.		
McGinty, W. Claussen.....	Outer Mark.....2 41 00	Finish.....5 15 00

Mardi.....	11 20 50	2 18 53	2 58

WESTERN TRAPS.

Montgomery Ward Ninth Contest.

CHICAGO, Ill., June 16.—The ninth contest in the Montgomery Ward diamond badge series was shot off at Watson's to-day, there being eighteen entries qualified and one visitor—Fred Gilbert—who shot in with the others. The result brings out another two-times winner, George Roll, of the Blue Island Gun Club, being the victor to-day, and having won the badge once before. This ties him with Sturdevant, of Evanston Gun Club. Mr. Roll also won the high average medal to-day after tying Dr. Shaw with 15 straight. Dr. Shaw will in all probability prove the final winner of the high average medal, as he has run 15 straight and gotten into the ties a number of times, though unlucky, as to-day, in shooting out the ties.

There were eleven men tied on 15 to-day—Shaw, Roll, Hicks, Hollister, Barto, Amberg, Steck, Elias, Odell, Irwin and Magill. The first string of five cut off all but two—Roll and Steck, who had to shoot 20 birds to get at a finish. Mr. Steck missed his last bird, which gave the decision to the big man from Blue Island.

The heaviest handicap allotted was that given to Mr. Palmer, who was placed at 32yds., though he was given 2 birds. Mr. Palmer retired with 13, and ascribes it to his distance, though ordinarily a bird is thought better than a yard. The other handicaps showed less divergence than was the case earlier in these series, 29yds. and 4 birds being the most liberal allowance, while the 30yd men were in the preponderance.

The ties on 14 were four in number, White winning inside the first string of 5. Palmer won the tie on 13 in the same early stage. The following are scores of the contest:

W B Leffingwell, 30, 1.....	222122211102011	—14
S Palmer, 32, 2.....	222002211*22011	—13
Dr Shaw, 30, 1.....	1211111111212	—15
*F Gilbert, 30, 0.....	2212211110111121222222	—24

Chicago Challenge Trophy.

During the afternoon of June 16 Messrs. T. P. Hicks and Silas Palmer shot off their race for the Chicago trophy. Mr. Palmer was placed at 32yds. and Mr. Hicks at 31, the latter winning by 2 birds. The time of the race was twenty-five minutes. The birds were good and those lost seemed to have been missed clean and hardly touched. Palmer's 5th bird was a very fast one, but was killed clean with the first barrel. Hicks' 24th bird was flagged. The direction of the light wind was from left to right across the score. The following were the scores:

Palmer, 32.....	1 2 0 2 0 2 2 0 2 2 2 1 2 2 2 2 1 2 2 2 0 2 1 2—21
Hicks, 31.....	2 1 2 2 1 1 2 2 2 0 1 1 2 1 2 2 1 2 1 1 2 1 2 1—23

It is announced by the trustees that should no challenge from an outsider intervene, the series for this trophy will be ended by a three-cornered race between A. C. Paterson, Silas Palmer and T. P. Hicks, each of whom has won the trophy five times.

Elgin National.

Word from Mr. C. E. Middleton, somewhat delayed, tells me that the Elgin National Gun Club shoot, June 3 and 4, was very successful financially and socially. The two Chicago visitors, Messrs. Irwin and Boa, acquitted themselves very well, Boa winning high honors for the two days, running 82 straight on June 4. Other shooters were on hand from Belvidere, Fox Lake, Aurora, etc. A picnic lunch was served free daily, and everybody voted the shooting park a great success.

South Dakota Association.

The twelfth annual tournament of the South Dakota Sportsmen's Association will be held at Carlton, S. D., June 20-22, targets and live birds. The contest for the live-bird championship of South Dakota will be held on the last day of the tournament, and promises to be an interesting event. Some of the best birds purveyed by John Watson at his Burnside Park come from Dakota.

E. HOUGH.

480 CAXTON BUILDING, Chicago, Ill.

Eureka Gun Club.

Chicago, Ill., June 17.—To-day was ideal for shooting. A good steady breeze blew from left quarter. Some good scores were made, Fred Gilbert shooting in fine form. Mrs. Carson made her best score of the season—23 out of 25.

In the trophy, W. D. and F. P. Stannard each got 24 out of 25, winning Class A. Dr. Miller won Class B, O. J. Buck won Class C and Dr. Morton won Class D. The scores follow:

Ed Steck	110110101111111111111111—22
Cunningham	11011011011011111111001—19

June 9.—To-day was almost a perfect day for shooting. The weather was clear, with very little wind, and some good scores were made. All shooting was over the magatrap. In the medal shoot, Adams, F. P. Stannard and W. D. Stannard tied on 24 in Class A, Dr. Miller won in Class B, Spreyde in Class C, and Mrs. Carson was high in Class D. In the handicap shoot six men tied on 25, and in the final shoot-off at 10 birds O. J. Buck won.

The Chamberlin Tournament.

THE sixth annual tournament of the Chamberlin Cartridge & Target Co., which took place on the grounds of the Cleveland Gun Club, Cleveland, Ohio, June 14 and 15, fell far short of the expected support and short of that accorded the Chamberlin tournament of last year. This was not from any inherent defect in the attraction itself nor from any indifference on the part of the shooters; the whole explanation is in that it followed the great shoot which was held in Buffalo the previous week. However, on this point all were not agreed. The bitter strike then in progress was mentioned by some shooters as being the cause of the falling off in attendance; others attributed it to the Buffalo tournament, while others again thought that both strike and tournament were the causes. Undoubtedly the Buffalo shoot was the real cause, though most of the shooters had but a vague idea of why it was so. The strike, as it related to the shoot, was too remote and to unrelated to be considered as being specially obstructive. It hampered transportation to the shooting grounds, and that was all. The Chamberlin Company had provided two large buses, which carried the shooters to and from the grounds via Wilson street, connecting with street cars which passed the hotels where the shooters were staying. Another route was by street car, railroad and bus, with a few minutes' walk at the end of the route by way of warming up. Thus the transportation, while inconvenient, was far from being suspended, in so far as it related to the tournament.

The falling off in attendance was a logical sequence to the Buffalo shoot. First of all, five moneys in 15 and 20-target events, where there were so many good shooters in the competition, was proved to be disappointing, so far as any returns to the shooters were concerned. Not a few shooters shot much better than a 90 per cent. gait and did not make expenses. It was natural that they should look askance on a proposition which embodied the same principles of competition as that with which they had but just finished. Next, and more important still, was the fact that the Buffalo shoot had cost the shooters a great deal of money, so much that an interval of time was necessary in which to re-adjust depleted finances. Of course, there were individual shooters to whom the expense was of no special consideration, but as a body the matter of expense is a matter of the first importance. A brief analysis will illustrate this point more clearly. Dealing with round numbers, there were nearly 100,000 targets thrown in the programme and preliminary events at Buffalo, which at 2 cents each took \$2,000 out of circulation among the shooters. In the merchandise event \$860 more were contributed, and shells, railroad fare and hotel must have averaged quite \$10 more to each of the 174 or more shooters, to say nothing of the incidental expense of the trip which would make about \$7,000 more or less that they contributed during the week prior to the Cleveland shoot. These figures are rough estimates, and therefore are inexact, but they serve to show that the shooters had spent a great deal of money for shooting, and these shooters were the same to which the Cleveland tournament looked for support. Also, the Buffalo shoot demonstrated to the satisfaction of most of the shooters that it took a very high performance and some good luck added thereto to break even. An average of 90 per cent, and better many times failed to clear expenses. Nevertheless, the shoot was far from being a failure, there being 58 shooters on the first day, 50 of whom shot through the entire programme. The second day had about the same number, though there was quite a change in the personnel.

Each day's programme was alike, namely, eight events, four at 15 targets, four at 20, each \$2 entrance; five moneys, class shooting. In the programme events, manufacturers' experts and professionals were barred, also for average prizes, excepting that offered for the best average in the professional class. This was a watch chain, a diamond, value \$50, set in a plain gold locket. A similar one was offered to the shooter making the highest amateur average. The highest average in the professional class was made by Mr. Rolla O. Heikes, who broke a total of 398 out of a total of 420 shot at, that number constituting the total number of the three days' programme. This was about an average of .947 per cent. Mr. J. S. Fanning was next in this class, with 391 broken, a fraction over 93 per cent. Each manufacturer sending representatives to the tournament was taxed \$5, with the privilege of paying as much more as they chose. Shooters who averaged 90 per cent. or better had \$4 deducted from their winnings each day, while those who broke less than 90 and over 84 per cent. had \$2 deducted each day. Those who desired to do so could shoot for targets only by way of paying 25 cents in each event. These moneys were divided pro rata among the amateurs (excepting the winner of first average) who shot in all programme events, and they netted each \$7.75. However, it seems a bit unjust to tax a shooter \$4 for shooting a 90 per cent. gait or better, or \$2 for shooting an 85 per cent. gait or better, if the winnings of the shooter are less than his entrance money, or less after deducting the tax. In such cases the shooter is simply paying, not out of winnings, but out of pocket.

In the amateur class, high average was made by Mr. Chan Powers. His was a phenomenal performance. There were 140 targets in each day's programme. In that of the first day he missed but 4. In that of the second day, part of which was shot on the first and part on the second, he missed but 2. In that of the third day, all of which was shot on the second day, he missed but 3, a total of 9 for the three days, an average of nearly 98 per cent. He was tied by Green on the first day, but led him 2 targets on the second day's programme and 5 on that of the third. Green's score would have been extraordinary in itself were it not so eclipsed by that of Powers, as it was over a 96 per cent. gait.

The trade was represented by Messrs. R. O. Heikes, A. G. Courtney, Capt. A. W. du Bray, L. Squires, J. S. Fanning, J. J. Hollowell and J. H. Mackie.

Mr. Paul North was manager, and his office was marked by the same diligence and efficiency as characterized it at Buffalo the previous week. Mr. R. C. McConaughy was cashier. Every detail was handled with the promptness and precision which come from perfect ability. After the Buffalo shoot, of which he had the cashier's department in charge, any other ordinary shoot would be a mere exercise, so far as the cashier's department is concerned.

Wednesday, June 14, First Day.

The weather was distressingly close and sultry. There seemed to be much humidity in the air, and the perspiration oozed out plentifully, but would not evaporate. There was much loosening of collars and mopping of faces in consequence. The shady side of the house and the open tent were the favorite nooks on the grounds. An early start was made to catch the 7:50 train, the depot of which was reached by street car. This train took the party to Petrie street, where a bus was waiting to take the shooters to the grounds, and although it had much the same capacity as a gospel tent—that is, always room for one more—a return trip was necessary to take the overflow. A few minutes' walk was necessary at the finish, ending in a climb up a long flight of stairs, so that every man was well warmed up for the work at hand before a shot was fired.

The first day's programme was finished, and all the parties at interest signifying their willingness to finish the three days' programme in two days, the second day's was begun, and five events of it had been shot when the day ended.

A warm northwest wind blew mildly and fitfully throughout the day, which would be about a 7 o'clock wind as the shooters stood at the traps. This made quite a difference to the slow shots, but practically none at all to those who shot in quick time. The targets were not thrown hard. As a whole, the conditions were not unfavorable to good scores. The background is good; indeed, the grounds are most pleasantly situated, besides being well equipped. Two magautraps most satisfactorily threw the targets. Once the shooting began, everything went off like clock-work. The scores:

Thursday, June 15, Second Day.

A heavy rainstorm in the night cooled the atmosphere and the sweltering heat of the previous day was past, much to the gratification of the shooters. The light was not so glaring, and the conditions were all better both for comfort and good work. A cool, mildly gusty wind blew from the northwest, comforting to the shooters, but toying with the targets at times, as shown by occasional duckings and dodgings of them, causing thereby not a few misses to such shooters as made no allowance for the changed conditions, or to such as were a bit slow. The remainder of the second day's programme was finished before that of the third day was taken up. The last gun of the entire programme was fired about 4 o'clock.

A question arose during the day in respect to whether a target was broken or not. One of the shooters shot at a piece of a target. The referee did not see it. When questioned, several of the shooters declared it a miss. No one declared it a hit. It was declared a lost target. The shooter objected on the ground that the outsiders should have no voice in the decision. In matters where the referee saw with his own eyes that contention would be good. Where he did not see, the only way to maintain the equity is to get the testimony of reputable shooters who did see. Common sense should govern under the circumstances, rather than far-fetched technicality. It would be manifestly unfair to give the shooter another target to shoot at if he had fairly missed, and there is nothing unfair in the referee being so informed if he failed to see it. Moreover, while this practice may not be embodied in the rules, it is sanctioned by fairly good general usage. The rules are founded on common sense and equity, which should govern exceptional cases as well as in all others.

At the close of the shoot Admiral Courtney presented \$10 to each of the other members of his squad—Messrs. Alex. Cochran, Fleming and Boa—this as agent of his company.

Honoring the Dead.

OMAHA, Neb., June 10.—The shooters of Omaha recently conceived the idea of putting on foot a movement to raise a fund for the erection of a monument to the memory of the Nebraska soldiers who fell in the war with Spain and in the Philippines. In order to accomplish the above it was decided to have a team contest between the two rival gun clubs—the Omaha and the Du Pont; also, to further stimulate interest, it was arranged for a similar race to be shot between the county and city officials. The general public was invited to witness these contests, and for this privilege the gate was 25 cents. In order to raise as large a fund as possible everyone interested was appointed a committee of one to solicit the purchase of tickets. Thus in this manner something over 4,000 tickets were disposed of.

The contest between the two local clubs was identically like that of the city and county—50 targets per man. This, singularly enough, resulted in a tie by a total of 405. It was at first supposed that the Omahas had won by 1 bird, and this club left the grounds under this impression, though it has since been discovered that it was a tie. The shooting was done on the Exposition grounds over a magautrap, and there were probably a thousand spectators present to witness the sport. The weather was fine and there was but little wind. Parmelee, Loomis and R. Kimball made the high score on the Omaha team, while Young and Curtis led the Du Pont.

Mr. Chas. North, of the Cleveland Target Co., and the FOREST AND STREAM correspondent were the out-of-town visitors present.

The contest between the city and county officials was disposed of first, and resulted in a win for the city by 337 to 331.

There were ten men to a team and each principal shot at 50 targets. The individual scores of the teams are as follows:

City.	County.
Bates.....40	H S McDonald.....45
Counsmen.....37	J W McDonald.....40
Clark.....37	Hummel.....40
Cook.....36	Hart.....40
Bingham.....36	Lewis.....32

PAUL R. LITZKE.

Boston Gun Club.

WELLINGTON, Mass., June 16.—The eight shooters who visited Wellington in search of a cool breeze Wednesday last, which was terribly hot, were a trifle disappointed in finding only a warm one. Nevertheless they commenced without loss of time to make the atmosphere hotter by repeated doses of nitro powder and chilled shot. The day otherwise was a fine one for target demolition, and by and by, when the sun descended behind the club house, and chairs were placed on the corner of walk, where a breeze played truant, the conditions were tolerable.

Some good scores were made in the match, and fair results were apparent throughout entire number of events.

Audubon Gun Club.

BUFFALO, N. Y., June 17.—There seemed to be a disposition to rest on the part of the shooters after the great shoot of last week, as there was a decrease in the attendance. C. S. Burkhardt's fine shooting was the feature. He made an average of 94 per cent. on the programme events, and a total of 125 out of 135. He also showed in fine form in the live-bird events, scoring 32 straight without a miss. The B badge and Hebard trophy wins were undecided. C. S. Burkhardt won Class A badge, making a straight score of 25, which makes the fourth straight score in this season's badge events, with only one more shoot to finish the season.

The Audubon Gun Club is making arrangements for the Fourth of July celebration by holding an all-day shoot. The programme will consist of both targets and live birds. The feature of the day will be the shoot for the Clinton Bidwell trophy, in open competition. The committee in charge contemplate a fee of \$5 instead of \$10, which will be an incentive for the largest attendance which has ever contested for this trophy.

* Badge. ** Hebard trophy.

Craig—Goodhue.

SHERBROOKE, P. Q., Canada.—Up in the Province of Quebec they have a great many shooters of the middle class. They have very few who can be classed as stars, but what they lack in skill they more than make up by earnest endeavor and immense ambition.

For the past two years an "individual trophy" has been passing about among a dozen of the gamiest shooters, and it gets little chance to rust. T. M. Craig, of Sherbrooke, has held it a good deal, and J. B. Goodhue, of Rock Island, has had it on his mantlepiece. It has also been in Montreal more than once. It bears the names of all who have shot for it, either as winners or losers, and gains in value and interest as it travels.

The last match was shot on June 3. J. B. Goodhue challenged T. M. Craig, and won a nice clean match:

	20 known.	20 unknown.	5 pairs.	Total.
Goodhue.....	17	19	7	43
Craig.....	16	15	7	38

W. L. Cameron, of Montreal, has since challenged Goodhue, and the match will be shot on July 1, during the progress of the Sherbrooke Gun Club's tournament. This tournament, as has been remarked before, is always a success from every point of view, and the 80 per cent. man is sure to find it a delightful occasion.

Dupont Gun Club.

OMAHA, Neb., June 13.—The club shoot of the Dupont Gun Club was held here to-day. There was a strong wind, which made the shooting hard. Following the club shoot was a match—Townsend and Curtis against Berlin and Burgess, 100 targets per man. The scores:

Club shoot:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Brookton Gun Club.

BROCKTON, Mass., June 15.—Inclosed find scores of our shoot to-day. It was a perfect day, but we did not have a large attendance. All the traps were set as low as possible, and speeded up a trifle, which, with a smooth, even wind blowing all the time, made the targets just scoot. Leroy was not bothered in the least with the speed of the targets; he broke his usual 96 out of the even 100 he shot at. We are always pleased to welcome him home. Every one appears to do better with him in the game. Next shoot changed to July 1, when we expect to shoot over a magautrap. A regular warming is expected. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Targets:	10	15	15	5	15	15	10	15	15	30	30	30	30	30	30	30	30	30	30	30
